"A PROPOS of the discussion of New Scotland Yard from an architectural point of view," writes a correspondent, "I had occasion to see Mr. Norman Shaw just after the completion of the building in 1890, and he himself distinctly expressed dissatisfaction with it. Now that the thing was finished, he said, he was bound to admit that it was not a success architecturally. The fact is, I have reason to believe, that—at least from the architect's point of view—Mr. Norman Shaw made a mistake in consenting to design this building under official tutelage. Mr. Matthews was at the Home Office at the time, and he and the Commissioner of Police—Sir Charles Warren, if I remember right—handicapped the architect with all sorts of stipulations and special requirements that were absolutely inconsistent with Mr. Shaw's own wishes in the matter. Simple utilitarianism was the dominant consideration everywhere, and next to that the principle which probably exerted most influence on the character of the pile was that which Mr. Ruskin has so strongly insisted on, that the exterior of a building should express the purpose for which it is set up. This New Scotland Yard to some extent certainly does, and on the whole it is, moreover, splendidly adapted for that purpose. But a building minutely designed for police service, and intended to express that purpose on its exterior, could hardly be made beautiful. Nevertheless, it seems to me impossible to dispute that it has a certain grim, bold originality about it, quite unlike anything else in the Metropolis, and certainly not wanting in dignity. Few persons are at all aware, what a multiplicity and variety of purposes this great block is applied to—police stores and mess rooms and kitchens, a tailor's shop, a printing office, a lost property office, a convict's property office, and so on—every room strictly adapted to its purpose, and every room, almost, exceedingly well lighted, warmed and ventilated. It is a splendid block of administrative offices, and Architecture has undoubtedly been sacrificed to some extent to serviceableness. The massive granite constituting the lower part of it has been dressed to so fine a surface that it has the appearance of Portland cement. The superimposing of bricks in this granite without the slightest break in the surface looks mean and ineffective. The chimney-stacks are singularly obtrusive in their bold ugliness, and the turret windows at the corners are curiously paltry in plainness and pettiness. These things justify some of the rough comment that has been poured on New Scotland Yard."

The new senior public school and secondary department of the West Calder School Board, Scotland, has been erected at an estimated cost of £4900.

The directors of the North-Eastern Railway Company have let the contract for the extension of the Middlesbrough dock to Mr. John Scott, of Cothelstone. The entrance channel is to be deepened along its course and widened on the south side. The plans are by Sir J. Wolfe Barry.

THE CASE FOR REGISTRATION.

By ELLIS MARSLAND.

THE question of "The Statutory Registration of the Profession" has occupied the minds of architects for many years, and the council of the Society of Architects is now taking steps to obtain the views of provincial architects upon the subject, with reference to which a Bill has been introduced into Parliament in the present session. With this object a meeting of architects was recently held in the Library of the Philosophical Hall, Park Row, Leeds. The chair was occupied by Mr. T. Walter L. Emden (President of the Society of Architects).—Mr. Ellis Marsland (hon. secretary) read a paper on the question. He asked what was meant by registration? It meant, in the present, that every man practising Architecture should be duly

ENROLLED IN AN OFFICIAL REGISTER

under an Act of Parliament, and be duly responsible for his professional actions, and that no one be allowed to practise until he had been duly enrolled. In the future it meant that no one be allowed to practise Architecture until he was duly qualified and had been found so by undergoing a qualifying examination. At present any person, with or without a fair general education, any builder, builder's foreman, clerk of works, clerk in a Local Board office, auctioneer, undertaker, *et hoc genus omne*, with the sole qualification of being able to provide a brass plate, was at liberty to advertise himself as a person qualified to give advice to the public in the science and Art of Architecture. Builders and others going out of their proper province boldly proffered their services as architects to their customers gratis; and the tempting bait of an apparent saving of 5 per cent. was not to be resisted. Could it be wondered at that

THEY WERE STILL UNRECOGNISED

while such a condition of things existed? for at present the public had no guarantee that the class who called themselves architects were any better qualified to plan and design their buildings than the contractors who erected them, and should they employ an architect they had no means of ascertaining that his knowledge was greater than that of the builder, and the only certainty about it from their point of view was that they would have to pay the professional charges. The advantages arising from registration were these:—Closing the doors to incompetent men; raising the standard of the Profession; and obtaining the confidence of the public and State recognition.—Mr. J. Wreghitt Cannon (Leeds) moved a resolution supporting the movement. He thought they were all agreed that the profession of Architecture was by no means in the position it ought to occupy, or that it was in the possession of those facilities or advantages which it was entitled to possess. For instance, they would be agreed that

THE PROFESSION FELL VERY FAR SHORT

of the professions of law and medicine in the facilities which were afforded it for educational purposes. They would also be all agreed that under existing conditions the profession of Architecture did afford opportunities for entry into it of those who were not strictly entitled to belong to it; and he was sure they would all be agreed that the number of architects was certainly in excess of the requirements of the population of this country. There were in the country some 1500 more architects than there was any necessity for, and there was only one remedy for that state of things, and that was a system of legal registration of architects. He expressed regret that the senior institution—the Royal Institute of British Architects—should not yet have seen its way to give its weight to this movement. When it became convinced that the great body of the Profession throughout the country was in favour of it, it would then give it its support.—Mr. D. Dodgson (Leeds) seconded the resolution, which, after a brief discussion, was carried unanimously.

CREDITON AND ITS DISTRICT.

By G. J. F. HOOKWAY AND A. L. COX.

(Continued from page 179.)

SOME two miles from Colebrook is the hamlet of Coleford, which was at one time a Roman settlement. One and a half miles further north is the village of Copplestone. The great centre of attraction here is the Copplestone Cross; it is of the greatest interest, and consists of a monolith of Dartmoor granite about 10 ft. 6 in. high, and stands on a modern battered or sloping base. The shaft is ornamented in three divisions, each with a different pattern; on all the faces there is, Runic ornament with intricate interlacing design. A few inches from the top is a rudely cut shallow niche that at a remote period certainly contained a figure. The head and arms of the cross are wanting; the whole is covered with yellow

man Conquest. The old home of the Copplestones, much modernised, stands beyond the village amidst beautiful scenery. Many distinguished members of this family have added their name to the roll of bishops and knights who have helped to make our country what it is.

A pleasant walk of two miles brings us to the village of Down St. Mary. It is situated about seven miles north-west of Crediton, and has a church built partly in the Norman, Decorated, and Perpendicular periods, and consisting of a nave, north aisle, and western tower, the latter containing three bells. The entrance to the church on the south side has built over it a rudely carved Norman tympanum, found built into the wall during the restoration of the church. The church has been most successfully restored by the late Henry Gould, and the elaborate fifteenth century screen has also been well and carefully restored by a parishioner, Mr. W. H. Bushell,

old village Cross. It stands upon a granite base; the shaft is chamfered, and likewise the head; the whole is of Dartmoor granite. Sandford and its immediate neighbourhood is, without doubt, the richest and most fertile land in the West country, or in the whole of the kingdom; in fact, for miles the soil is of the richest and most fertile kind.

Not far from here is an old mansion; it is said it dates back to the days of King John, but little of the ancient fabric remains. The centre of the building and the gate house are, however, part of the original work. It belonged to the Dowerich family, and contains several family portraits, with some interesting relics. These relics date back to the Middle Ages. About one and half miles distant is the church of Upton Hellions. It is dedicated to St. Mary, formerly to St. Nicholas, and is built partly of the Norman and Perpendicular periods. It consists of chancel, nave, and south aisle, and western tower, containing one

CREDITON AND ITS DISTRICT.

lichen. As to its origin we can only suggest that it is a bound stone, for it is situated at the junction of three parishes, viz.: Crediton, Colebrook, and Down St. Mary. Many of the ancient and rudely carved granite crosses on the wild expanses of Dartmoor serve this purpose, and were guides to travellers over the lonely moor. As to the date when this old monolith was first erected we have no exact knowledge, but it is mentioned in a Saxon charter of A.D. 974, and is probably anterior to the establishment of the see of Devonshire at Crediton. It appeals strongly to the antiquarian, and we can but state that Copplestone may have derived its name from it, for in Anglo-Saxon we have "Copp" meaning head, and thus *Copp-lestone* means chief stone.

Here resided, in great state, the Copplestone family. This noble family can trace its pedigree long anterior to the age of the Nor-

and is a credit to him in every way. Down St. Mary is a typical Devonshire village, and the church is well cared for.

Two miles north-west of Crediton is the village of Sandford. Its church, dedicated to St. Swithin, is a small Perpendicular building, consisting of chancel, nave, with clerestory, aisles, south porch, and western tower, containing five bells, all recast in 1748. The upper stage of the tower and nave walls were raised, together with a new chancel and clerestory, which was erected in 1848; consequently little remains of the ancient work as compared with churches in the neighbourhood. There is an old brass to the memory of Mary Dowerich, who died in 1604; the upper part is divided into three parts. Though of a late date, this brass is interesting, in the fact that we have so few remaining in this part of the country. In the churchyard is to be seen the

bell; the piers or responds from which the chancel arch springs are Norman, and some of the masonry of the walls is certainly of this period. The south-west door leading from the porch into the nave is Early Norman, the shafts having simple cushion capitals and bases, similar to those on the tower piers at Crediton Church. The building has undergone partial restoration, but much yet remains to be done. Not far from here is Shobbrook Park, with its stately elms. The village not far distant has little of interest. The church, dedicated to St. Swithin, contains some Norman work, but is mainly Perpendicular in style. The building was almost entirely destroyed by fire in the 17th century and was soon afterwards rebuilt, but of the original work there remains only the Norman door on the south side of the church and some walling. In 1879, the building went through a thorough restoration

CREDITON AND ITS DISTRICT. NEWTON ST. CYRES.

and was enlarged with the addition of the south aisle, and again in 1888 the upper stage of the tower was entirely rebuilt. The Communion plate comprises an ancient flagon which was presented to the church by Thomas Lamplough, who was at the time Bishop of Exeter, 1676-1689. This prelate afterwards became Archbishop of York, and held the latter see from 1689-1691. Sir Jonathan Trelawney, who was also Bishop of Exeter, presented the chalice and paten in 1689. Sir Thomas Bodley, founder of the famous Bodham Library at Oxford, was rector of the parish for some time, and eventually became canon residentiary of Exeter Cathedral.

Taking a south-westerly direction, a walk of about four miles from Crediton brings us to the village of Tedburn St. Mary. Tedburn is really a township and is situated on the high road to Okehampton. The ancient church, dedicated to St. Mary, consists of chancel, nave, north aisle and south porch and lofty embattled and pinnacled western tower. There is Early English work in parts of the building, but, as is usual in most Devonshire churches, the Perpendicular period predominates. On the south side of the nave is a small chantry or chapel. The chancel was mostly rebuilt and the church restored in 1868. About $1\frac{1}{2}$ miles from the church is Great Fulford Park, the ancestral home of the Fulford family. This distinguished family has been represented over and over again in the annals of English history, and none were more noble than Sir Francis Fulford, who lived and held the estates in the middle of the seventeenth century. In such esteem was this sturdy Royalist held, that when Fairfax quartered his army in the neighbourhood he gave the strictest orders to his men and officers to in no way do violence to his person, servants, or property, and to allow Sir Francis to pass the guards between Devon and Dorset. This was granted when he was looking after his lawful affairs, and, furthermore, whoever did violence to either of his family or to his person should answer to the contrary at their peril. The mansion is of the Tudor period, and, as was usual at that time, it surrounds a quadrangle. It is a fine specimen of an old English home, though fallen much into decay. There is to be seen in the entrance hall some fine oak panelling, dating from the reign of Henry VII. The house contains many fine old portraits, together with a full-length painting of Charles I.,

given to the Fulfords by Charles II. soon after the restoration, and it is said that on one occasion Charles I. slept here. The mansion is very interesting, though only portions of it are habitable. The park is extensive and exceedingly beautiful, and far-famed for its splendid avenue. A fine Renaissance tomb to Sir Thomas Fulford, who died in 1610, is to be seen in Dunsford Church, not far distant, but beyond the limits of the district round Crediton. The monument has undergone restoration, and has been re-coloured.

We have now brought to the reader's notice those churches and the many architectural subjects worthy of being included in this short article on the neighbourhood around Crediton. It will be seen that the district is full of interest, and contains many relics of a bygone age. Each village has something or other different from its neighbour. There are many other villages quite as interesting as these which we have described and sketched, but they would make a separate article by themselves, these being only some of the principal. Copplestone certainly is the most interesting for the antiquary.

KEYSTONES.

THE new buildings of the Middlesex Hospital are now rapidly approaching completion.

THE contract for the extension of the Millom Ironworks Pier has been entrusted to Messrs. Gradwell and Co., Barrow. The pier will be made 800ft. longer than it is at present.

IT is reported that six firms of contractors have tendered for the construction of the new dock for the Cardiff Railway Company, and that the contract will be given out shortly. The engineers' estimate for the work is about £666,000.

IN addition to the general memorial for that part of the Diocese of London over which the late Bishop of Bedford presided, it has been decided to erect an open-air pulpit in the churchyard of Spitalfields Church. The estimated cost is £175.

A PROPOSAL is on foot to erect a church for the parish of St. Luke's, Thornaby-on-Tees. Plans for a building capable of seating about 700 people have been prepared by Messrs. Hicks and Charlewood, Newcastle. The estimated cost without the tower is £6000.

THE partial clearance of the block of houses in front of the Cecil Hotel in the Strand that has now been effected will permit of the central archway being set up, and when this has been accomplished the closing of the side roads into the hotel quadrangle will follow, and the entire demolition of the remainder of the old block will be carried out.

THERE is an increase in both the numbers and the value of the private Parliamentary bills deposited for the session relating to railways, canals, tramways, and the supply of gas, electricity, and water, the number being 197, as compared with 188 of last session, and the total amount of money proposed to be raised no less than £53,300,579, as compared with £50,742,141.

A LOCAL GOVERNMENT BOARD inquiry has been held into an application by the Plymouth Corporation for sanction to borrow £22,306 for the erection of a museum and art gallery, £550 for street improvements, £2500 for public lighting, £15,800 for the reconstruction of sewers and repairing of streets, and £1340 for the purchase and adaptation of premises for the purpose of a fire and police station.

THE Scarborough Town Council has resolved to purchase St. Nicholas' House and grounds for £33,000. The estate, which covers an area of about three acres, embraces the mansion facing the Royal Hotel in St. Nicholas Street, with the adjoining shop, and the Exhibition Buildings and Coastguard station on the Fore-shore Road. It is the intention of the Corporation to convert the house into municipal offices, affording accommodation for all the departments of the Town Council, while the gardens and undercliff will be reserved as public pleasure grounds.

CREDITON AND ITS DISTRICT.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
April 20th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

ALDERMAN JOHN THOMPSON, the well-known church builder and restorer of cathedrals, has just died at Peterborough. He had during his lifetime been engaged on the restoration of every cathedral in England. He built the Royal College of Music and Church House, and was engaged in the restoration of Peterborough and Salisbury cathedrals.

THE work of rebuilding the old wooden railway station at Windsor is now far advanced. The Queen's waiting-rooms, which are self-contained in one block, have recently been finished. They consist of a general saloon, with a dome of stained glass, and having a handsome fireplace, with overmantel of carved oak, in the design of which the Royal and Imperial monogram and Jubilee dates are repeated. The kerb and back of the grate are of black and white marble. The room is furnished in the French style, with brocaded chairs upholstered in rose terra-cotta, the rugs, which are laid on parquet flooring, matching them in colour. The walls are of solid English light oak, and are panelled in the same warm tints. A double door communicates with a dainty writing-room, provided with lounge chairs and a marqueterie table. Beyond are sumptuously-fitted-up lavatories. Electric light is at command throughout the suite.

THE paper on Modern Stage Mechanism to be read before the Society of Arts to-day (Wednesday) by Mr. Edwin O. Sachs, will deal with practically a new subject, to which little or no attention has so far been given in this country, although important stages worked by hydraulics and electricity have been used in the United States and on the Continent for a considerable number of years. Mr. Sachs, after dealing with elementary equipment of the stage of to-day, will indicate the lines on which modern science may be applied to the mounting of plays, and he will give particulars as regards the general working of the theatre, and speak of various ways of obtaining realistic effects or illusions on the stage effects. A valuable series of photographs, sketches, and drawings from modern stages will then be shown by the aid of limelight views and explained by the lecturer, and among these will be all the more important examples, including those of the Paris, Vienna, Berlin, and other Continental opera houses, as well as Drury Lane and Covent Garden stages. Special reference will be made to the hydraulic installation at Drury Lane, and the electric turn-table stage at Munich.

SIR WILLIAM B. FORWOOD, Chairman of the Library, Museum, and Arts Committee of the Liverpool Corporation, with two other members of the Committee and the Curator of the

CREDITON AND ITS DISTRICT.

Walker Art Gallery in that city, have recently been on a tour of the London studios with the object of securing attractive works for the next Autumn Exhibition. The curator has just submitted his report, in which he says that the deputation were cordially received, and in nearly all cases received promises of contributions should the works be at the artists' disposal in the autumn. There was no diminution in the production of suitable pictures, and little falling off in important works. The desire to be represented at the Academy and other summer exhibitions in London seemed as dominant as ever, and there appeared every prospect of those metropolitan displays being important and attractive in no ordinary degree. The fine weather of the winter had enabled artists to pursue their labours, and their works were seen to be bright and fresh, and much more finished than in previous years at this time. It was found that young artists are springing up who will worthily carry on the traditions of English Art. At least six sons of eminent painters were visited, and it was found that they bid fair to equal, if not excel, their fathers' artistic productions, though on different lines, while a number of other young artists are striving for fame with every prospect of success. Very few artists complained of want of patronage.

THE MESSRS. COOPER have now in their workshops at Great Pulteney Street an interesting example of modern artistic wood-carving, viz.: a beautifully modelled ceiling, a replica of the perfect timbered roof at St. Margaret's Church, Westminster, well known to all lovers of the few remaining specimens of artistic archaeological Art in these days of disestablishment and decay.

WRITING from Athens to the Times, Sir W. B. Richmond says:—"I very much regret that owing to my absence from England I had no opportunity of adding my name to those of my colleagues who signed a letter in which was expressed just admiration for Mr. Shaw's New Scotland Yard, a building which does honour to the great architect who designed it and to the city in which it stands. Our politicians should be more careful than they have been upon a recent occasion to criticise matters within their knowledge and experience,

and to leave matters of taste to those whose business they are."

THE thousands of visitors to Anne Hathaway's Cottage at Shottery, the scene of Shakespeare's courtship, will be interested to know that some necessary repairs and improvements have been in progress the last few months, and have just been completed. All the window casements were found to be in a dangerous state. The woodwork was utterly rotten, and the old glass and leadwork were falling out. Several of the plaster panels between the timber-framing were on the point of collapse. They had been exposed to the weather from the time the cottage was built—probably between 400 and 500 years—and several of the main timbers were found to be completely decayed in places—especially was this apparent near the rubble foundations. The old windows and casements have been very carefully repaired. English oak frames and mullions have been put in, and the ancient glass has been put back in diamond-shaped leaded lights. All the timbers have been renewed where absolutely necessary, sound oak many centuries old, taken from ancient buildings in Stratford, being used. Two old windows hidden beneath the plaster were discovered and opened up, and oak panelling that has been removed at different periods has been restored to its original position. The massive beams have been scraped of the whitewash which had covered them for generations and properly cleaned and oiled, and the several rooms made more interesting by disclosing once more various old characteristics of the building. The old-fashioned "dog grate" of the living-room was found at the bottom of the old bacon cupboard, where it had remained about fifty years. The old-fashioned garden, containing most of the wild flowers mentioned by the poet, has not been touched. It is intended, however, to restore the old path, the original stones of which are visible in places.

WHILE excavating for the purpose of laying foundations for a villa to be erected on the south side of Wickham Road, Beckenham, a large quantity of ancient brickwork has been discovered. This would appear to be the ruins or foundations of some very old building. The structure—which is being cut through with

much difficulty, transversely and longitudinally, as the present work requires—is composed of extremely hard red bricks, the cement being very coarse and greatly hardened with age. The walls commence some 2ft. below the original surface, and extend to the bottom of the cuttings, which are 6ft. or 7ft. in depth, and possibly still lower. They are about 4ft. in thickness, and evidently several hundred years old. The building plot contains a particularly fine specimen of the cedar tree, which must be at least 500 years of age, and it is not improbable that the original structure may have been erected when the tree was planted. Happily the tree will remain undisturbed. The Wickham Road is one of the most wooded parts of Beckenham, and the site of the proposed villa is on the Kelsey Park estate, a large wooded tract, containing a fine avenue of ancient trees.

In the Chancery Division Mr. Justice Romer has heard the case of *Harrison v. Wood*. The plaintiff sought to enforce a covenant relating to a building line, and also to restrain the defendant from encroaching beyond the line. It appeared from the statement of facts that the defendant owned a considerable piece of land in Wistaston Road, Crewe, and on February 16th, 1894, sold a plot to the plaintiff, the conveyance containing the covenant in question. The plaintiff built some houses on his land, and the defendant retained the adjoining land, and in 1896 (two years later) he built some houses on his land just to the north of the plaintiff's portion. The defendant's main building was not complained of, the complaint being that the defendant had put bay windows to the houses, which encroached about 18in. beyond the building line. The defendant alleged that the plaintiff had himself broken the covenant by putting a small cornice to his house about half-way up the elevation, and that, therefore, he could not rely upon the covenant as against the defendant. The judge looked at photos of the property, and ridiculed the idea that the small cornice, which was simply a piece of ornamental wood-work, was an infringement of the covenant. His Lordship next ridiculed the objection to the defendant's bay windows, which he said had improved the property tremendously. After some further observations by his Lordship, who suggested the matter should be settled by counsel without any further trouble, a compromise was effected by which the plaintiff was freed from his covenant, and was at liberty to build bay windows to the same extent as the defendant's, and the defendant was to indemnify the plaintiff for any liability to any third party he might possibly be put to in doing so.

The Asylum's Committee of the London County Council submitted at the recent meeting the report of Mr. W. Adams, the manager of the Works Department, with regard to the excess over the estimate of £7923 for works completed by the Works Department at the Heath Asylum, Bexley, in the half-year ended September 30th last. The final estimate was £31,306 18s. 10d., and the actual cost £39,230 9s. 10d., the work being done under a schedule of prices prepared by the architect and accepted by the Works Department. Mr. Adams reported that the sum of £1451 18s. 3d. for maintenance of roads and damage by frost was not allowed for by the architect, and there were also preliminary items not included. He observed that the prices generally were low, and should not have been accepted by the Works Department. In conclusion, he said: "It therefore would not appear that the cost can really be called excessive, and I venture to think that the comparison is not unsatisfactory as regards the Works Department. At the same time, I find instances in the methods adopted for the carrying out of this work as described to me, but of which I have no personal knowledge, with which I could not agree, and which, I am of opinion, have enhanced the cost." On the other hand, the architect (Mr. G. T. Hine) defended his position. He stated that, excluding the question of repairs to roads, and assuming that the Works Committee were not preju-

diced in their purchase of materials by the recent rise in building prices, he still considered that the real value of the work was fairly represented by the amount set forth in the final estimate.

The Committee of the Parish Church of St. Nicholas Without and St. Luke, Dublin, appeal for funds to enable them to carry out urgent and necessary repairs to this venerable structure. St. Luke's is the only existing parish church in Dublin which is closely connected with the coming of the Huguenots from France in consequence of the revocation of the Edict of Nantes in 1685. The present ceiling of the church has for some time past been in a somewhat dangerous condition, and the cost of keeping it in repair would be very considerable. It is intended to remove it altogether, and to substitute for it a ceiling which will be permanently secure. The committee mention that the chancel window has given much anxiety on account of its worn-out condition, and it is considered necessary to extend the chancel outward, so as to provide for the reception of a new window. Considerable repairs are also necessary in various parts of the church, including the windows and the roof.

An important arbitration case, under the scheme for the Housing of the Working Classes in the Metropolis, recently came before Mr. H. T. Steward, F.S.I., sitting as sole arbitrator at the London Surveyors' Institution. The parties were Mr. John Cooper, a leather merchant and builder, of Caledonian Road, King's Cross, and the London County Council, the former bringing a claim against the latter for £1833 as compensation in respect of the compulsory purchase of the dwelling-houses, from 20 to 30, Churchway, St. Pancras, and 8 to 10, York Buildings, Somers Town. It appeared that the property which the County Council proposed to acquire under the scheme for the Housing of the Working Classes, in order to erect model dwellings on the site, comprised a group of dwelling-houses, and was let to Mr. Cooper under a lease for a term of three and a-half years, from March, 1897, at a ground rent of £76 per year. Occupying the houses were thirty tenants, paying a weekly rental of £6 15s. The gross annual income derived was £332 1s., from which the usual deductions were made for the purpose of the proceedings before the arbitrator, as follows:—Ground rents, £76; rates, £37 12s. 6½d.; water rate, £5 17s.; insurance, £1 11s. 6d.; repairs, £32 6s.; collection, £16 3s.; allowance for contingencies, £22 12s. 2d., making a total of £192 2s. 2½d. A balance of £130 18s. 9½d. had been taken on the 6 per cent. table at fourteen years' purchase, making a total claim of £1833 3s. 1d. The improvement proposed by the County Council was known as the St. Pancras Churchway Improvement Scheme. For the Council expert evidence was called to show that the value of the property was much less than that claimed for it, and that it was greatly overcrowded. Subsequently the arbitrator visited the property, and decided to reserve his award.

The spring exhibition of the Birmingham Royal Society of Artists consists of about 800 works in various media, and, in general character and quality well maintains the reputation of the Society. There is, perhaps, nothing strikingly original either in the canvases or drawings, but most of the prominent schools in Art are represented, and among the contributors are many painters whose names are so well-known as to be a guarantee of excellence and a sure attraction. One departure the Council has made which will earn for it the thanks of the subscribers and the visiting public—the inclusion of an extremely interesting collection of portrait miniatures.

The collection of valuable pictures and drawings left by the late Mr. F. W. Amsden, of Sydenham, and just dispersed at Christie's, realised upwards of £16,000, and included good works by English and foreign painters. The highest figure was for an example of Van Marcke, one of his well-known cattle subjects, representing cows standing in a pool, and a

tree and foliage background, 1260gs. An interior of a fisherman's cottage, "Watching," by Israels, brought 700gs., and a fishergirl on the seashore, by the same, 580gs.; an Egyptian street scene, painted in 1885, by L. C. Muller, 600gs.; a view on the Thames above Henley, by Vicat Cole, 700gs.; "Great Marlow" and "Harvest Time, rainstorm coming on," by the same artist, 280gs. and 270gs.; "An Autumn Afternoon, Ben Slioch," by H. W. B. Davis, 480gs.; "No Tidings," by Frank Holl, 340gs., and "Bereaved," also by Holl, 240gs.; "Gathering Seaweed," by J. C. Hook, 380gs.; "Landing Eel Pots, evening," by J. Linnell, 405gs.; by B. W. Leader, "On the Thames Teine, Worcestershire," 255gs.; "A Welsh Lake Scene, with trees and figures in the foreground," 225gs.; and another Welsh scene, 280gs.; a river scene, with reeds and a windmill date 1885, by Keeley Halswelle, 235gs.; "Rocks on the Coast, with gulls and cormorants," by Peter Graham, 820gs., and, by the same, "Highland Cattle on the Borders of a Lake," 420gs.; the banks of a river, with cattle, by Daubigny, on panel, 260gs.; and, by Dieterle, a marshy landscape, with cattle, 270gs.

The extension at the south end of the Temperate House, near the Pagoda in Kew Gardens, is now completed. A similar addition to the opposite end of the Temperate House is being rapidly proceeded with. When this is finished this range of conservatories will be one of the finest in the kingdom.

The Art treasures of Scotland seem to be flourishing. The Parliamentary Blue Book just issued on the affairs of the different institutions in that country which are devoted to pictures and antiquities mentions some agreeable facts. The National Gallery has undergone structural repairs and internal renovation, with consequent reclassification of the collection of works of Art. The North British Railway Company paid for the structural repairs, because they were made necessary by their tunnelling operations. Mr. John Ritchie Finlay presented £10,000 to the National Portrait Gallery, and the money is being spent on the decoration and ornamentation of the buildings. The niches of the exterior are being filled with statues of eminent Scotsmen—the category including three Kings (Alexander III., James I., and James V.), the Franciscan Poet (William Dunbar), David Hume, and Watt, and Sir Henry Raeburn, the portrait painter. By adding a further £1000, contributed by Mr. Finlay, to other money available, the authorities of the National Gallery purchased last year for 5000 guineas the splendid picture "La Gloria," which was painted in 1884 by John Phillip, the famous Scotch painter of scenes of Spanish rustic life.

Two windows have just been filled with stained glass in the north choir aisle of Truro Cathedral. The subjects form links in the historic series, illustrating the progress of the Church, designed for the Cathedral. In the eastern light are represented three martyrs of the early Church. In the centre is the figure of St. Cyprian, Bishop of Carthage, clad in episcopal robes of crimson, white, and purple, holding a crozier in his left hand and giving the benediction with the right. A little below him on the left side is the touching figure of St. Perpetua, with her babe in her arms, beautifully depicted. The martyred matron is dressed in green and red. On the side is St. Lawrence, the great Archdeacon of Rome, wearing a dalmatic of blue and gold, and holding the Book of the Gospels in one hand, and a gridiron, the instrument of his martyrdom, in the other. On the predella is represented the scene of St. Cyprian's martyrdom. The martyr is kneeling with his eyes blindfolded by his own hands, wearing his "long, white, girdled linen tunic." The centurion wielding the sword is in the act of giving the death stroke. In the background are soldiers of the 3rd Legion, spectators, and the clergy of the beloved bishop, who witnessed his glorious confession. Below is the inscription: "Cyprianus, martyrizatur." In the western light is represented the boy martyr, St. Pancras, robed in

a blue tunic, with a coloured girdle, crowned, and bearing a palm branch and a cross in either hand. Below is St. Alban, dressed in green and gold, with the sword of martyrdom in one hand and a palm branch in the other. On the right is the figure of St. Katharine, crowned as a Royal Princess, robed in crimson, holding a book and a palm, and with the wheel of her martyrdom by her side. In the predella below is the scene of St. Alban's confession of faith before the magistrate. The latter stands by pagan altar, and in the background are soldiers; the martyr stands with hands bound, boldly and calmly facing his judge. Below are inscribed the words: "Albanus, coram iudice." The lights were executed by Messrs. Clayton and Son, Regent Street.

THE canopied work over the stalls in the chancel of St. Lawrence's Parish Church, Ludlow, has been completed and the niches filled with figures. The work was begun by Sir Gilbert Scott, and his design has been carried out throughout. The posts which terminate the "shades" have been treated somewhat differently, as it was felt that, although the spaces and marks on the posts showed that there had been canopies and niches placed there, the work should be distinctly nineteenth century, and so the forms of the brackets are given a different character. The six angels in each post are holding shields, on each of which is an L in token of St. Lawrence. On the south side are St. Peter carrying the keys, St. Andrew with a cross, St. James the Great with staff, St. John holding a cup with a serpent, St. Philip holding a large cross, St. Bartholomew holding a knife, St. Thomas carrying a kind of lance, St. Matthew with a purse, St. James the Less bearing a club, St. Simon carrying a saw, St. Jude with a lance, St. Matthias bearing an axe, St. Paul with a sword, and St. Barnabas wearing a bishop's mitre. On the screen are represented St. Lawrence, the patron saint, with a gridiron, and St. Chad with a cathedral in his hand. On the north side are Old Testament prophets, viz., Isaiah holding a saw, Jeremiah holding stones, Ezekiel holding a model of a city, Daniel bound with a lion beside him, Hosea breaking an idol, Joel holding a pyramid, Amos as a shepherd, Obadiah with a short scroll, Jonah with a book preaching, Micah holding a star, Nahum holding falling towers, Habakkuk preaching, Zephaniah denouncing, Haggai holding a temple, Zechariah as a priest holding a scroll, and Malachi holding a ring in an attitude of sorrow. The work has been entrusted to Mr. Lawrence Turner.

THE Select Committee inquiring into the cost and administration of the museums of the Science and Art Department held another meeting recently, when Sir John Donnelly, secretary to the department, was examined. Sir H. Howorth said it would be of great assistance to the committee if they could get from the officials of the department an expression of their views as to the changes which were desirable or were not desirable in regard to the housing of the Science and Art collections.—The witness replied that was rather an awkward question. He really did not think it would be proper for him to volunteer any statement which might conflict with the present proposals of the Treasury and the Board of Works. He had already stated that, in his opinion, the science collections should be on the west side of Exhibition Road and the Art collections on the east side. He believed that that was the proper solution of the South Kensington question.—Sir H. Howorth: Mr. Akers Douglas has stated that, with the removal of the residences and of the secretarial offices to Whitehall, the Government find that they will have at their disposal a much larger space than had been previously contemplated, and that, therefore, they will be able to put the Science and Art collections on the one side of Exhibition Road. Do you think the space thus provided will be sufficient for the whole of the collections being placed together?—The witness: I do not think so, and that was my reason for saying that I saw no ground for changing the opinion I have

already expressed on this subject. I contemplate that the museums will increase, and I do not think it wise to consolidate the collections on one side of the road. In answer to further questions, Sir John Donnelly said he thought it was most desirable that the geological museum in Jermyn Street should be transferred to South Kensington. The library which was now in Jermyn Street would be of great value at South Kensington, and under the present system of division they had to duplicate many of the books. He would undertake to bring this view before the Lord President and the Vice-President. As to the Art side, the theory that it was better to have a large series of small rooms in which they could classify their objects rather than a series of very large halls or rooms was absolutely impracticable in their case. He was distinctly in favour of residences being provided for some of the officers—say four—either in the same buildings in which the collections were housed or very close to them. There was, he knew, a morbid fear of fire being caused when the residences were in the actual building, but he did not himself believe that this was a very great source of danger.

MANY years ago, when the cutting for the Grand Canal was being made, an ancient wooden causeway was discovered in the parish of Clonfert, not far from the cathedral. This wooden causeway, on being exposed to the air, crumbled into dust. There is a tradition in the district that a secret underground passage formerly existed connecting the cathedral with the ancient monastery in a field adjoining. Scarcely any trace of this monastery remains. Recently the workmen engaged in the restoration of the cathedral came across a portion of the stonework of the window of the north transept. They also found embedded in the earth some fragments of the ancient monastery, consisting of two portions of a beautifully fluted stone arch. These, with some very old tombstones—one with an English inscription dated 1698, one with a Latin inscription nearly as old, and another with an inscription in Irish very much older than either—have been placed in the vestibule of the cathedral. When the workmen were repairing the ancient sacristy they found what is believed to be the entrance to the secret underground passage referred to. Fearing that injury might be done to any carved stonework which might be found, the excavations have been discontinued for the present. The work of general restoration, however, progresses. It is being done in sections as money is subscribed. The chancel is almost finished. These excavations could be done by competent workmen under the direction of Mr. Fuller, the architect, under whose supervision the restoration of the cathedral is being carried out.

THERE is every chance of considerable delay before the work in connection with the formation of a new foot-tunnel under the Thames at Greenwich, sanctioned by the London County Council more than a year ago, is commenced. When the Bridges Committee of the Council first reported on the desirability for the construction of this tunnel, they stated, on the advice of the engineer, that the total estimated cost of the works amounted to £65,000, and that the cost of acquiring the land for the purposes of the scheme was £5500. In February last tenders for the work were invited from six selected firms. Two tenders only were received—one from Messrs. Mowlem and Co. amounting to £119,732, and the other from Messrs. Pearson and Son amounting to £155,000. Sir Alexander Binnie, the engineer, in a report on the cause of the excess of amount of tender over his estimate, says that no doubt some of the excess is due to the operation of the Council's labour clause. A further cause he assigns to the enhancement of the cost of materials since his estimate was drawn up, and the provision in the conditions of contract that each man when working in compressed air should be supplied with 8000 cubic feet of air per hour. The total power of the Council to expend money under the Act authorising the construction of the tunnel is

limited to £70,500. When, however, the Bill was before Parliament, the committee, after a protracted contest, inserted clauses to meet the claims of those persons whose ferry rights were liable to be affected by the tunnel, as well as those whose interests will be injured by the scheme. To meet these claims it has been decided to include in one of the Council's Bills this year a sum of £30,000. With regard to the sum to be fixed to meet the increased cost of the works, the engineer has advised the Council that, although his amended estimate is £83,175, as against his first estimate of £65,000, he thinks an additional sum of £55,000 should be added to the latter sum, making the total estimated cost of the works £120,000. The total cost of the tunnel, for land, compensation, and works, will therefore be £155,150. The Council has authorised the necessary steps being taken to insert a clause in the Money Bill for 1898, authorising the expenditure of the further sum of £55,000 on the work in connection with the tunnel. Meanwhile, until Parliamentary sanction has been obtained for the extra expenditure, the question of the acceptance of either of the tenders remains in abeyance.

BEFORE Mr. Justice Mathew and a special jury the case of *Firth v. The New Wire Wove Roofing Company Limited* has been heard. It was an action for damages for breach of contract and breach of warranty. The plaintiff, Mr. Arthur Firth, was the principal proprietor of the Craigside Hydropathic Hotel, near Llandudno, and the defendant company, who carry on their business in Queen Victoria Street, E.C., were the patentees and sole manufacturers of a material known as "Duroline." In 1893 the plaintiff had two covered tennis courts erected as an additional attraction to his hotel, and he was advised by a traveller of the defendant company to have his courts roofed with "Duroline," which was guaranteed to be absolutely weather-proof, and a perfect substitute for glass. In consequence, the plaintiff employed the defendants to put up their patent roofing at a cost of £350. Shortly afterwards a tennis tournament was held, and it was found that rain came in through the roof. Complaints were made to the defendants, and they sent down a man to make good the leakages. In the following year, 1894, however, the state of the roof became worse than ever, and when there was any rain the courts could not be used at all. The light also became bad, owing to the duroline becoming dirty and opaque. Under the circumstances, the plaintiff was compelled in 1895 to substitute glass for the duroline in both courts. The plaintiff now claimed to recover back what he had paid to the defendants, and expenses he had incurred in putting on a glass roof.—The defendants contended that the duroline which was put up was perfectly fit and proper for the purpose for which it was supplied. The fault was not due to the material, but to the building to which it was affixed, which was not sufficiently powerful, and vibrated when a strong wind was blowing. Evidence was given that duroline was in use at the Imperial Institute and other places, and had given satisfaction.—One of the directors of the company said he went down to examine the roof of the tennis courts, and found it had been damaged by bits of slate which had evidently been dislodged from the roof of the hotel by the force of the wind, and had cut through the material of the duroline.—After hearing the evidence, the jury returned a verdict for the plaintiff for £350, and judgment was given accordingly.

It was originally intended that the new Vauxhall temporary bridge should have eleven openings, the central one having a span of 70ft. and a height of 20ft. above Trinity high water. It was, however, subsequently found that such a structure would be seriously in the way of traffic on the river, and plans were altered, at a cost of £12,800 beyond the original £30,000 intended. The pier that was to have supported the centre of the bridge has been dispensed with, and a clear waterway of 150ft. thus provided.

HALF-TIMBER VIADUCTS IN CORNWALL. SALTASH.

DOMESTIC ARCHITECTURE IN THE UNITED STATES.

By A. N. PATERSON, M.A.

At the meeting of the R.I.B.A. on Monday night a paper entitled "A Study of Domestic Architecture in the Eastern States of America in the year 1896, with special reference to questions of Plan, Construction, Heating, Drainage, &c.," was read by Mr. A. N. Paterson, M.A., Godwin Bursar 1896. In opening his subject, Mr. Paterson said that the first colonists carried with them to America not only the language, the laws, and the flag of the old country, but its Architecture also. In what was known as "Old Colonial" would be found reproduced, with such modifications only as ensued from the adoption of wood instead of brick or stone, the buildings of the time of Queen Anne and the first Georges. Influenced, however, by new conditions of climate, of materials, and of class relations, and impelled by a constant and steadily increasing influx of wealth and demand for comfort, America had produced a type of house characteristic and original.

FROM AN ARTISTIC POINT OF VIEW

the best examples equalled, if they did not surpass, the highest standard of work in Great Britain; while as regards convenience and comfort the type was superior to that common in England, and one from which English architects might learn much. Having shown that climatic conditions were responsible for the open type of plan characteristic of the American house, the lecturer referred to a few of its more distinctive features—the cellar for the heating apparatus, which also had an important part in determining the scheme of drainage; the complete system of heating, reducing draughts to a minimum, allowing double doors of extra width to be wide open, and leading to the almost universal adoption of sliding doors; the effect of spaciousness, even in small houses, due to the large hall and open doors; the verandahs, which had greatly developed in suburban and country residences, and become

A CHARACTERISTIC FEATURE

in plan and elevation; the bedroom "closets," or receptacles for wardrobes, chests of drawers, &c., the heating system rendering the bed-chamber available as a secondary and independent sitting-room or snuggerly, folding beds being largely used; the service-rooms, a marked feature of the American plan, less isolated than in the English house. Types of town houses were then referred to in detail, the lecturer selecting examples of the self-contained residence. The houses of the wealthy conform more to the European model, with American characteristics confined to matters of detail. Appreciative reference was made to examples of self-contained residences at Washington, in which the art of planning is admirably exemplified, the awkwardness of the site being turned to advantage, with due regard to the scale, proportion, and symmetry in the disposition of the apartments. Here, too, brick, the material of the country, has been employed in a natural and simple manner, with commendable reticence in design. The lecturer then followed with a description of apartment houses in New York, their appointments, rents, &c.; workmen's houses, with which New York is but very poorly provided; suburban houses, dwelling particularly on an example at Brookline (Boston); and various types of country houses and summer resorts. In his observations on construction and materials, the lecturer referred to the

STEEL-FRAMED CONSTRUCTION,

so largely employed in the tall buildings of the States, as exerting a very pernicious influence on the architects' art from the point of view of sound Architecture. Buildings were constructed on the principle of a steel cage, divided horizontally into layers, with no internal supports to speak of, and the whole sheathed with an apparently—but utterly sham—constructional skin of granite, stone, brick, or

marble. The stone corbelling under the projecting oriel, a constantly recurring feature, is, in nine cases out of ten, a sham. Window mullions, themselves probably formed of stone sheathing round a steel core, are carried by steel cantilevers bolted at the back into the girders of the floor below, and the correctly designed and jointed corbel courses with difficulty carry their own weight. The expense of stone was offered as an excuse; yet the same house had its marble, mosaic, and hardwood finishings, at a cost ten times what would have sufficed for making the construction honest. For roofs, floors, and partitions, fireproof construction is now generally adopted in all important domestic work in the cities. The elaborately constructed brick and terracotta arches between the girders, common in England, are not used in the States for floors to be subjected to lighter strains. Floors with tension members are coming much into vogue. In

THE CONSTRUCTION OF FLAT ROOFS

an extensive use is made, in combination with other materials, of "roofing paper" or felt, laid in several thicknesses and bedded in tar. Most commonly the outer skin is of copper, laid either directly on the concrete, or on wood and felt, in sheets 12in. by 24in., and with soldered joints. Partitions are commonly built of hollow blocks of porous terracotta. Tiles of similar type are used for casing structural steel work, and in some cases instead of lathing on the internal wall face. Thin fireproof partitions, finishing from 1½in. to 2½in. in thickness, are much in favour from the saving in space effected. These are mainly constructed by using channel or flat bars, with expanded metal lathing or burlap between, plastered with hard setting mortar on both sides. Some interesting particulars having been given of methods of construction in vogue for country and suburban houses, the lecturer went on to discuss the various systems of heating employed, observing that Americans regarded our system of open fires with something of the same feelings as we did the apathy of some of the more outlying countries of Europe and the East concerning modern ideas of sanitation. Nevertheless, the fireplace is as general a feature in American as in English houses, serving as an effectual ventilator, and valued for its cheerful appearance and the decorative character of its surroundings. Steam, hot water, and hot air are

THE MEANS OF HEATING MAINLY EMPLOYED; the two former being much the same as used in public buildings in England. Warming by hot air, essentially applicable to small areas, and almost unknown here, is practically universal in the States for all houses costing about 6000 dollars (£1200) or less. In the smaller class of city houses, in apartment houses, and hotels, where the limitations of space render a multiplicity of air flues embarrassing or impossible, and where its superior cheapness is of importance, direct radiation, either by steam or hot water, is universally adopted. In the more luxurious and expensive city houses indirect radiation is the invariable system. In the largest mansions the assistance of an electrical or steam-driven fan is invoked to regulate the distribution of the heated air, which is also screened and moistened as required. In treating of these methods of heating, after a brief reference to one or two special forms of installation, the lecturer dealt more fully with the hot-air system as being least known in England, illustrating his description by diagrams of the apparatus, the furnace, cold-air supply, and hot-air flues. In matters of

PLUMBING AND DRAINAGE,

the lecturer said America had made great advances and was far ahead of England. This progress was mainly due to the stringent laws adopted by the city Boards of Health, and rigidly enforced. Before building, complete sets of plans and sections showing plumber work and drains, to the scale of a quarter of an inch to the foot, had to be deposited with the Boards. On these the nature and positions of every fitting, pipe, and trap must be clearly indicated. Draft specifications are issued by the authorities for the guidance of architects.

Two main characteristics are apparent in this class of work—viz., the openness of everything, and the substitution, along with cast-iron for fireclay drains, of wrought-iron and brass for lead in the supply and smaller waste pipes. The lecturer closed with a description of the Waring system of sewage disposal for isolated houses and small communities, which is employed very generally throughout the Eastern States, and with entirely satisfactory results.—Professor Kerr, proposing a vote of thanks to the lecturer, said, confining himself entirely to the plan part of the subject, there were several

NATIONAL CHARACTERISTIC PECULIARITIES

which affected the planning of houses in America. Whether the English could derive any benefit from considering them was a question he was not able to answer, but at the present moment he could not see where the benefit was to be obtained. In the first place, there was the question of climate. They must bear in mind that in the United States there were a great many more climates than one, and in the study of "Richardson's Designs" they would find that he mainly adopted the characteristics of the South, and applied them to the Eastern Counties. Another important point was that referred to by the lecturer as

"THE DIFFERENT CLASS RELATIONS."

Those who had been in America, and were connected with American people, would know what he meant when he said that there existed a relationship between master and servant such as did not exist in Europe at all. In America the servant was as good as the master, and, if occasion offered, was a good deal better. There was no denying the fact that that created a social association which was of importance in planning. Then there was another peculiar characteristic about Americans which was not easily explained, and that was their fondness for hotel life. Not that they preferred to go out of their way to live at an hotel, but it was the way in which they occupied their homes. A glance at a plan would show that they were very

MUCH LIKE THE HOTEL;

there was the element of reception observable in the plan in a remarkable way. Would the people of England like the sliding doors which were so prominent in the American houses? It would not do here at all, but the American liked to live in his own house as his own hotel. Without going into the historical part of the subject, they would see that it was the Latin way of living, for the Latin race formed the house with open roof and court, but the Goths founded their plan upon a confined and inclosed principle. A further peculiarity of the American house was the introduction of the closet in the bedroom, with the dust of the luggage, &c. That would not do in this country, and therefore they could not learn a lesson from it. As to the question of

SERVANTS' APARTMENTS,

he maintained that there was a necessity for a separate division, and that the servants were entitled to their own privacy as much as the family was entitled to it.—Mr. H. H. Statham, seconding, said he could not help thinking that a study of the American plans would be a suggestion to them to get a little out of the way of the ordinary view of the house plan—to get out of the habit of making a number of shut-up rooms. It was a question whether with their scientific systems of heating they would not get more space and dignity than they were able to give by the ordinary arrangement. There was a great deal in the American suggestion on the shape of rooms. They did not stick so rigidly to the ordinary square rooms as in England; they rather adopted the oval and circular rooms, which in some points perhaps were inconvenient, but in others had the advantage of lending variety and some times pretty architectural effects internally.—Mr. Paterson briefly replied, observing that he did not bring forward the subject for English architects to look upon it as something superior to what they were accustomed to, but merely as an article for study.

Surveying & Sanitary SUPPLEMENT.

APRIL 20TH, 1898.

Practical Carpentry and Joinery.*

BY GEO. ELLIS.

(Continued from page xxii.)

JOINERY.

HAVING touched upon all the more important points in the construction of a building that appertain to the work of the carpenter, we next have to consider that of the joiner, who is concerned with the interior fittings and embellishments that are intended to make the structure comfortable, useful, and ornamental. The joiner not having to provide against any very searching strains upon his construction, is less interested in the strength of his material than in the accurate fitting of

joints, which being more frequently in tension than in compression, the converse of the carpenter, require intelligent design and careful execution to adopt them to the numberless positions they occupy. Ordinary weather seasoning, although quite suitable for the carpenter, is insufficient for him: his stuff must be "dry," i.e., not only every particle of sap removed, but all the surface moisture which the cells of wood exposed to the air absorb, must be dried out artificially and kept out, and here it may be noted that all the skill of the craftsman exercised to keep surfaces even and shoulders "up" will be wasted if the pores of the wood are not sealed directly he has finished, or if his work is executed in the winter in cold, damp, ill-ventilated workshops, when even the very care exercised in selecting material will tend to defeat its own object, as the drier the wood the more readily will it absorb the surrounding moisture, to be subsequently evaporated with disastrous results.

The construction of doors affords an opportunity of studying the first principles of joinery, in the formation of framing that shall be light, rigid, strong, and unalterable, with its component parts so arranged as to freely expand or contract, according to the hydrous state of the atmosphere, without altering the appearance or weakening the construction.

As it would be impossible within the limits of these articles to deal with every variety of door in general use, six examples have been selected which may be looked upon as types of the method of treatment employed generally. The first example is that of a panelled door (Figs. 94-96), and embodies in its construction many of the principal methods and joints used in joinery, viz., sawing, planeing, mortising, tenoning, grooving, rebating, &c. The plough-groove X (Fig. 96) is a device largely used by the joiner to so secure wide, thin boards in position that they may swell or shrink without injury to the containing frame. Deep grooves are not advisable, as their sides have a tendency to curl away from the panel, due to the moisture absorbed by the inner unprotected surfaces; in most cases $\frac{1}{2}$ in. will be found sufficient, as a 9 in. panel will only shrink $\frac{1}{4}$ in. in width. The mortise and tenon joint used for fastening two pieces of wood together, whose grain runs at right angles, or nearly so, with each other, is probably the most frequently used, as it undoubtedly is the strongest form of joint. It is executed by cutting with a suitable chisel a rectangular hole through one piece parallel with its side; this is the mortise; and a corresponding projection upon the end of the other piece to fit the mortise, by removing parallel slips (the cheeks) from each side with a saw to the required length; the centre piece left is called the tenon, and is secured in the mortise by wedges driven at each end, which, when glued, form a dovetail that is practically immovable. The abutting portions of the joint are called the shoulders, and as not only much of the strength of the frame, but also its good appearance, depends upon the accuracy with which these are fitted, the skilful joiner pays great attention to this part of his work in the preliminary setting out (as the marking of the positions and sizes of mortises, shoulders, &c., is termed). When the shoulders are of equal length on

each side of the tenon, they are said to be "square," irrespective of the angle they may make with the surface; when one side is longer than the other, to fit a moulding or other recessing, they are then called "shouldered" or "odd;" and when they are not at right angles with the edge of the piece they are

FIG. 94. PLAN.
A PANELLED DOOR.

the various parts, the regularity and fineness of the surfaces and mouldings, and its susceptibility to a high finish. To this end he pays more attention than the carpenter to the seasoning of his wood, its freedom from knots and air shakes, and to the construction of his

worked on, they are called "bevelled shoulders" (see Fig. 105). When a mortise or tenon is not carried right through the material it is called a stub, as at T (Fig. 95). One tenon, whatever its width, is called a single tenon, whilst one wide tenon, divided into two smaller ones, as at Fig. 97, is a pair of single tenons, and two ranged side by side, as in Fig. 98, are double tenons. A tenon is seldom cut quite down to the shoulder, a small portion being left on, usually $\frac{1}{4}$ in. long. This is the haunch, and fits into a corresponding recess in the mortised piece, termed the haunching. The names of the parts of a door are common to all similar framing; the outer vertical pieces are stiles, the inner similar pieces are muntings. This is a corruption of mounting, from the appearance of the piece being mounted or raised on the panel. The horizontal members are rails, and are identified by their position, as top, bottom, middle, frieze, &c.; the sunk portions are panels. These are classified according to their treatment, as square or flat when as in the upper part of Fig. 95; moulded,

Fig. 101.
SECTION ON A-B.

as at M (Fig. 95); beed butt, as at b (Fig. 99); beed flush, a (Fig. 99); raised panel, when the central part is surrounded by a sunk margin, usually chamfered; tracery, as in the Gothic door (Fig. 110); and drapery, when carved as in the lower part of the same figure. Panels in which the grain runs vertically are named "upright," those in which it runs horizontally, "laying" (see Fig. 105). In beed-butt panels the beed is only worked on the side edges in the direction of the grain, the ends remaining square. In the beed flush—which is somewhat of a misnomer, as the panel is seldom flush and the beed never, beed and return would be nearer the mark—the beed is worked all round the panel, being stuck on the sides as in beed butt, and loose pieces mitred and glued into recesses cut across the ends; this is shown in the isometric sketch (Fig. 99, c), the top return piece being left out to show the recess. They are not an advisable form, for if the panel swells the mitres come open, and if it shrinks the side beads will split off. Tenons should be one-third the thickness of the framing, as this gives equal strength to mortise and tenon. This must, however, be to some extent governed by circumstances, as for instance the thickness of chisels, which increase by sixteenths of an inch, or the thickness of panels, because if the grooves for these exceed the size of the mortise or pass beyond one of its sides they must be stopped at every mortise, which adds considerably to the cost of the work. When the shoulders by the above arrangement exceed $\frac{1}{2}$ in. wide, they should be tongued as shown in Fig. 107, to prevent them curling off, because the glue sinks into the end grain and affords little hold. A framed, ledged and braced door, with solid rebated frame, is shown in Figs. 100-102. These are used in positions exposed to the weather, such as coach houses, back entrances, &c., and are constructed in such manner as to offer as little edge surface to the rain as possible. The two stiles and top rail of the framing are of equal thickness. The other two rails, shown in dotted lines, called ledges, are thinner; they are flush on the back side of the frame, and so arranged that the narrow boards, called the battens, when nailed to them, are flush on the face side. The upper ends and outside edge of these battens are

tongued into a groove running round the framing. The tenons on the ledges are made barefaced—that is, they have shoulders on one side only. Braces equal in thickness to the ledges run diagonally between the rails to keep the door from racking. The lower ends of the braces must be at the hanging stile, and the joints should be made as shown in the figure, stopped back an inch from the shoulder, for, if placed in the angle, the weight of the door will tend to push the stile off. All joints in these doors should be painted and not glued, as also the edges and tongues in the joints of the battens. Iron tongues should not be used, as they rust and discolour the door. Unless the battens are wet when used, an eighth of an inch joint should be allowed at each side for expansion, otherwise the stiles will be thrust off. Wrought nails should be used, punched through and clinched. Double margin doors are wide single doors made to appear like a pair of doors with a beeded joint. When two doors are really used, they are termed either a pair, or double doors, indifferently.

These doors are made in two distinct ways. First, the centre stile is made in one piece, and forked over the top and bottom rails, which are continuous, the intermediate rails stub-tenoned inside, and all tenoned and wedged at the outer ends to the stiles in the ordinary way. Second, the door is formed of two separate leaves, each with a set of rails and two stiles, the middle pair being ploughed and tongued and glued together, then wedged with three pairs of hardwood folding wedges as shown in Fig. 103. After the rails are wedged up, a double quirk beed is recessed in on each side to hide the joint, and a flat iron bar is sometimes sunk in the upper edge of the top rail to further stiffen it. The elevation diagram shows the door in course of construction just after the meeting stiles have been joined together, and before the panels are inserted. The double line indicates the recess for the cover beed, and the central line the joint.

Fig. 104 is an edge view of a meeting stile, showing the mortises for keys and tenons, and also the joint groove. In Figs. 105-107 are given the elevation and sections of a glazed swing door, with diminished stiles, such as are used for interior entrances in shops and public buildings. The essentials of this class

of door are, that they shall open easily and shut automatically, be fairly draught-proof, strong, and admit a maximum of light. These requirements are met by reducing the width of the stiles above the middle rail, keeping the latter low down, making the door of hard wood, as mahogany, teak, walnut, &c., and not less than $1\frac{1}{2}$ in. thick, with wide rails and thick panel, and a substantial frame to absorb the shock occasioned by the swinging. The easy and automatic action on opening and closing is effected by hanging the door on pivot hinges, the lower one being attached to springs (enclosed in a metal box sunk flush with the floor), whose tendency is to keep the door closed in its frame; it however yields readily to pressure applied in either direction, and throws the door back to its original position when released. In some forms of the hinge additional springs are used to check the violence of the swing a few inches from the post, and to allow the door to come to rest slowly. The metal shoe S (Fig. 105) into which the door is fitted, is attached firmly to the steel pivot upon which the door turns: a similar pivot is inserted into the under side of the frame head, and works in a brass plate sunk in the top rail of the door; the upper pivot is mounted on a fulcrum, and can be drawn up flush with the head by turning a screw in the plate to enable the door to be placed in position. The edges of these doors must be shaped to the curve of their path described from the centre of motion.

The next article will open with a description of the method of finding the position of the centre of a swing door.

(To be continued.)

Surveying and Sanitary Notes.

At the present time the Director of Works Department at Devonport Dockyard is purely a supervising staff, as all new works and alterations are done by contract. This system has been costing in salaries over £4000 a year

will spend no less than £102,683 on new buildings and repairs, exclusive of the Keyham Dockyard extension and the extension of the Royal Naval Barracks. This sum will be distributed over the various Admiralty departments as follows: Devonport Dockyard, £28,900; Keyham, £4329; Royal William Victualling Yard, £11,000; Royal Marine Barracks, £2000; Royal Naval Hospital, £21,450; minor works (each under £1000), £33,013. The most important of the new

arrangements and alterations to schools, £4525. Royal Naval Hospital: New steam laundry, £7400; two new blocks for officers, £15,000; infectious diseases block, £14,000.

At the monthly meeting of the Burntisland Town Council the report of Messrs. J. and A. Leslie and Reid, engineers, Edinburgh, who were called in by the Council to investigate the defective water supply, was submitted. The report shows that among the more serious leaks was one at the harbour, where an old cast-iron pipe, which at a former time supplied water to the harbour lighthouse, was broken by the pressure of railway sleepers, and the water was running to waste there. This pipe has now been cut off. A heavy leak traceable to a blown joint was found in the main pipe between Kilmundy reservoir and a point west of Kirkton, and at Seaforth Place, where a 4in. pipe with an open end was discovered, considerable leakage occurred. In addition to these leakages, Messrs. Leslie and Reid found many defects in the water fittings of houses, wells, and closets, and they make recommendations with a view to obviating further waste from these sources. The Council remitted the report to the Water Committee to have the recommendations carried out.

A REPORT on the drainage of the Tideswell Road district of Eastbourne by Mr. Henry Law states that the area is partly drained by a high level and partly by a low level sewer. With regard to the latter Mr. Law states that this sewer is, for its whole length, below the level of the marshes, and in the winter season the greater part of the sewer must be some feet below the level of the subsoil water. It is, therefore, of the utmost importance that the sewer should be water-tight, but according to Mr. Gloyne, the borough engineer, although "it seems almost incredible," says Mr. Law, the joints of the stoneware pipes, of which the sewer is constructed, are made with clay, a consequence of which has been a leakage into the sewer, when the water in the subsoil is above its level. Mr. Law further records some most eccentric variations in the levels of the sewer; and in the case of at least two houses in Wellesley Road it has been found that the floors of the basements of these houses, which are used as living rooms, are only about a foot above the level of the marshes, while they are more than 7ft. below the level of the highest high water, and 2½ft. below the level of an ordinary spring tide. Flooding has resulted from this condition of things. Mr. Law recommends that the size of the new sewer proposed to be constructed be increased to afford a greater storage capacity on the occasion of heavy falls of rain. The first 760ft. should be laid with stoneware pipes, the diameter being increased from 9in. to 12in., and the remaining 2140ft. should consist of an oval sewer, 30in. by 20in., constructed with concrete blocks. The storage capacity of this sewer would be four times that of the existing sewer. The cost of a sewer of the same dimensions as the existing one is estimated at £1276, and of the larger sewer, as recommended, £1885.

FIG. 106. SECTION.

FIG. 107. SECTION ON C-D.

for this department alone, but it is stated that the Admiralty are considering the advisability of reverting to the system which existed up to about fifteen years ago, when mechanics and labourers were specially employed at Devonport Dockyard, and borne on the Government books as permanent workmen for such works as have of late years been given to contractors. The necessity for such a change is shown by the fact that this year alone the Director of Works Department at Devonport

works with which the Department will be entrusted are: At Devonport Dockyard: New mould loft, to cost £8000; new workshops, £4730; rebuilding No. 8 storehouse, £5500; alterations to No. 3 dock, £3300; launching ways for No. 3 slip, £6940; extension of ship-fitting shop, £4180. At Keyham: Extension of machine shop, £6500; alterations to police quarters, £2320. At Royal William Victualling Yard: New cooorage, to cost £16,000. Royal Marine Barracks: Improved sanitary

FURNITURE: PAST AND PRESENT.*

BY W. ROLAND PECK, F.A.I., F.S.A.

(Continued from page 188.)

AFTER Chippendale, the other well known men are Shearer, Hepplewhite, and Sheraton. The less known names are Mannering, Ince and Mayhew, Copeland, Lock and Johnson. As I can only judge of these by the few designs of theirs now in existence, I must class them all as inferior to Chippendale, and, having no special and individual style, they can only remain in history as worthy imitators of their great master. Of the beautiful blending of many Italian styles by the Brothers Adam, plenty of examples still exist, but their position is primarily that of architects, and the furniture they designed, chaste and beautiful as it is, was intended only to be subservient to their interior decoration. Both these famous men were, at different times, architects to the King. One of their greatest works was the rescuing of the land from the Thames and the building thereon, upon a series of arches, of what is known as Adelphi Terrace. In 1788 the "Society of London Cabinet Makers' Book of Prices" was published, and Shearer and Hepplewhite were both members of the Society. This book was issued for the general good without any desire in the part of the designers to reserve any benefit accruing to themselves, and the working cabinet makers throughout the kingdom freely

COPIED THE DESIGNS.

Shearer appears to be best known by his cabinets, secretares, writing, and dressing or wash-tables, containing secret drawers and compartments. In those days banks were not, apparently, used for storing valuables, and these hidden receptacles were utilised as safe places for money, jewels, and deeds. Sir Joshua Reynolds's cash box, sold some time ago at Christie's, although outwardly of perfectly plain appearance, contained numerous secret drawers, not only in the bottom, but also in the sides and lid. In the Society's book of prices, just referred to, I find the pillar-and-claw table first mentioned, as also writing fire-screens. Hepplewhite, who lacked

THE EXQUISITE SENSE OF PROPORTION

and lovely curves of Chippendale, was no doubt a great cabinet maker, and will for ever be known as a master where lightness and grace are concerned. In introducing his book, which is one of the most important contributions to English cabinet making, he says: "My general object is to unite elegance with utility, and blend the useful with the agreeable." He also appears to have been a lover of Art for Art's sake, for he adds that he was anxious to give the benefit of his own improvements to his own countrymen and to those artisans whose distance from the metropolis rendered it difficult for them to acquire knowledge without much trouble and expense. With Hepplewhite we get the connecting link between Chippendale and the more severe lines of Sheraton. He will be remembered for his speciality of coating his furniture with lacquer,

AFTER THE JAPANESE AND CHINESE STYLES, is a ground-work for beautiful painting, principally in scrolls and panels. We also get from him, for the first time, so far as I can ascertain, the shield-back chairs, which, by a common error, are generally classed as Chippendale. Another test whereby we may know a Hepplewhite chair is the carved wheat-ear, and the seats of his chairs are all much smaller than those of Chippendale. This was owing to the fact that ladies about this time were graciously pleased to reduce the size of their bustles. So Hepplewhite we owe the comfort of what we now call the "Grandmother" chair, but we must try and forget that he ever invented the centre settee, of which he seemed to be very proud. Modern auctioneers cannot sell, and sometimes cannot even give away, these umbrous articles. Sheraton, the last of the

great furniture designers of the eighteenth century, has a distinct charm of his own. To him we owe the introduction of the lyre-back to English chairs. To the elegant Hepplewhite sideboards Sheraton added much ornamentation, and at the same time many conveniences, such as the tambour front, the cellarette, and the heated cupboard. He also gave greater prominence to the ornamental brass work at the back, seldom, if ever, using the simple brass rail of his immediate predecessors. The vase-shaped knife boxes, which up to this time had generally been of metal, were made of wood,

BEAUTIFULLY INLAID,

and used by Sheraton as part of and in distinct keeping with his sideboards. These knife boxes, when proved to be genuine, realise, as we all know, high prices at auction, and are generally converted into stationery cases. Speaking for myself, and judging only from the few specimens of authentic work which I have seen, I place Sheraton next to Chippendale, and regret that time does not allow me to refer to some examples of his work, and to give reasons for this opinion. One piece—a perfect poem—I must speak of for a moment. It is a Sheraton toilet table, and will well repay a special visit to South Kensington Museum. Not only does it show Sheraton at his very best period, but the panels are exquisitely painted by Angelica Kauffmann, whilst the other decorations are by Cipriani. Just for a moment let us look at the sentimental side of the question. Poets have in many ages sung of pictures, but furniture does not appear to have inspired their muse. Massinger, in 1660, speaking of the bedchamber of a rich and lovely lady, says: "The silver bathing tub, the cambric rubbers, the embroidered quilt, the bed of gossamer and damask roses." Milton, in "Paradise Regained," speaks of the "stately sideboard." Dryden says: "No sideboards then with gilded plates were dressed." Thackeray, in his "Cane-Bottom'd Chair," gives a charming description of a bachelor's apartment:—

Away from the world and its toils and its cares,
I've a snug little kingdom up four pairs of stairs.

This snug little chamber is cramm'd in all nooks
With worthless old knickknacks and silly old books,
And foolish old odds and foolish old ends,
Crack'd bargains from brokers, cheap keepsakes from friends.

No better divan need the Sultan require
Than the creaking old sofa that basks by the fire;
And 'tis wondrous, surely, what music you get
From the rickety, ramshackle, wheezy spinet.

Long, long through the hours, and the night, and the chimes,
How we talk of old books, and old friends, and old times;
As we sit in a fog made of rich Latakia
This chamber is pleasant to you, friend, and me.

But of all the cheap treasures that garnish my nest,
There's one that I love and I cherish the best:
For the finest of couches that's padded with hair
I never would change thee, my cane-bottom'd chair.

'Tis a bandy-legg'd, high shoulder'd, worm-eaten seat,
With a creaking old back, and twisted old feet;
But since that fair morning when Fanny sat there,
I bless thee and love thee, old cane-bottom'd chair.

Although the occupants of these chairs had more interest to the poets than the manufacture, it is interesting to remember that one of the greatest poets of the present century was actually himself a designer and maker of furniture. You will not find many allusions to furniture in the poems of William Morris, but you can trace the influence of his Art theories in the rooms of every cultured man of to-day. He understood the vital importance of encouraging true artistic ideals among the people, and as a result of his work, and of the work of the men of his school of thought, the middle and the upper classes have been impregnated with a revived taste for Mediæval Art. Morris's work has been useful also in the encouragement of craftsmanship. From another point of view it has been of great value in counteracting some of the absurdities that evolved from the growth of the pseudo-aesthetic movement of twenty years ago. It was news to me to discover, a few days ago, that Molière, one of the great lights of the seventeenth century, was brought up as an upholsterer, and followed this—his father's—trade until literature claimed his whole time.

There is, I think, a distinct connection between poets and good furniture, and, after looking at the authenticated chairs of Shakespeare, Burns, Gray, Pope, Wesley, and others, a lover of good work would be compelled to describe them all as beautiful. Finally, we come to the furniture of the present. This is the age of revivals. Strictly speaking, the nineteenth century has no style of its own. It is somewhat remarkable that, although it has given us railways, telegraphs, telephones, penny-post, motor-cars, the new woman, and the other wonderful achievements of the Victorian Era, and although it has seen the birth and glorious manhood of the Auctioneer's Institute of the United Kingdom, it has produced nothing really original in furniture (with the possible exception of a few pieces by Morris and others) which our successors will care to remember. The ugly pedestal sideboards and wardrobes, horse-hair couches and uncomfortable stuffed-backed dining-room chairs remain in the older houses to remind us of the revolt against the graceful lines, delicate carving, and lovely colouring of Chippendale and his school—a revolt brought about by the depressing influence of the Georges. We must try to forget that only a few years ago ebonized and gilt furniture was the rage, and was the only furniture which then realized high prices at auctions, and when Chippendale chairs sold at about 8s. each. We are now repeating the fine examples of

THE WORK OF THE EIGHTEENTH CENTURY, and I look forward with sanguine anticipation to the twentieth century for a style and fashion which will show Britain not only great in wealth, but great in Art; not afraid to copy where the examples are good and true, but improving with a beauty formed from the genius of the time. I cannot leave this period without quoting from Lichfield's very valuable book on furniture. He says:—"There is evidence of the want of interest in the subject of furniture in the auctioneer's catalogue of the day. By the courtesy of Messrs. Christie and Manson the writer has had access to the records of this old firm, and two or three instances of sales of furniture may be given. While the catalogues of the picture sales of 1830-40 were printed on paper of quarto size, and the subjects described at lengths, those of 'furniture' are of the small octavo size . . . and the descriptions rarely exceed a single line . . . the whole proceeds of a day's sale were often less than £100, and sometimes did not reach £50. . . . Armoires by Boulle have during the past few years brought from £4000 to £6000 each under the hammer, and the want of appreciation of this work, probably the most artistic ever produced by a designer and craftsman, is sufficiently exemplified by the statement that at the Stowe Sale in 1848 (which, by-the-by, lasted thirty-seven days) two of

BOULLE'S FAMOUS ARMOIRES

were sold for £21 and £19 8s. 6d. respectively. We are accustomed now to see the bids at Christie's advance by guineas, by fives and tens, and it is amusing to read in these old catalogues of marqueterie tables, satinwood cabinets, and other articles being knocked down in 1830 to 1845 for such sums as 6s., 15s., and occasionally £10 or £15. Sale on February 25th and 26th, 1841, lot 31—a small oval table, with a piece of Sevres porcelain painted with flowers, 6s." It is highly probable that had this piece of furniture been sold to-day it would have realized over £100. Prices have certainly vastly improved during the last fifty years, and a genuine love for the good and beautiful in home furniture is daily growing; cheapness is not the one great thing now desired, and people are beginning to understand the words of Mr. John Hungerford Poller (whose works on furniture should be read by all students), who wrote, "Beauty which is created by the hand of man is not the clever application of mechanical forces or of scientific inventions, but is brought to light, whether it be a cabinet front or the Venus of Milo, often with pain, always by the entire devotion of the labour, the intellect, the experience, the imagination and the affection of the artist and workman."

* A paper read before the Auctioneers' Institute of the United Kingdom.

MUNICIPAL BUILDINGS IN LEEDS.

EXTENSION SCHEME.

LEEDS TOWN HALL is one of the most stately structures in the country; indeed, it is seldom that we find a modern building of more beautiful proportions anywhere. Looked at from whatever point it is imposing. There is nothing insignificant, little that is unworthy—it is majestic, strong, inspiring, like the lions that guard it. This uniform grandeur is one of its most striking characteristics. All this may be averred, says the Leeds Mercury, though we have not yet seen the building to the greatest advantage. It is a case in which "distance lends enchantment to the view." We require to get farther back than the limits of Victoria Square in order to obtain all the gratification of the eye which the artist designed to afford. Then, are not some of its surroundings a reproach—an evidence of indifference to artistic unity? Standing in the Square, we have on the one side

A TRIUMPH OF MODERN ARCHITECTURE;

on the other there has been allowed to remain what would discredit many a colliery village. Whilst nothing was left undone to make the exterior of the Town Hall attractive, it seems strange that internally there should have been a manifest disposition to merely serve the purpose. Victoria Hall has certainly fine features and rich embellishment, but elsewhere the fittings and furnishing of the building are cheap and out of harmony with the outside magnificence. In the corridors and on the staircases there is nothing to please the eye. Anyone who has seen the buildings devoted to municipal administration in Birmingham, Manchester, Glasgow, and even not a few smaller places, must feel that the Town Hall of Leeds lacks much to be desired. But the

DEFECTS RANGE BEYOND THE DECORATIVE.

Those more particularly concerned are becoming disagreeably conscious that the accommodation in the Town Hall for the transaction of the business of the city is quite inadequate, even supplemented by that of the Municipal Buildings. Measures for remedying the deficiency ought not to be long delayed. Under the conditions the only feasible plan seems to be that suggested at a meeting of the City Council—to remove the Assize Courts, and adapt the space thereby gained to the municipal requirements. New courts would have to be erected. The acquiring of a suitable site for such a structure suggests the carrying out of a more extensive improvement. It must be generally admitted that the Public Free Library, occupying the upper floors of the Municipal Buildings, is in the wrong place. Is it too much to hope that the city would be disposed to erect a building which should comprise not only a Free Library but a public reading-room, and likewise an Art Gallery? As to

THE EXISTING ART GALLERY

and reading-room, is it unreasonable to anticipate that Leeds will be disposed to take the place she ought to do as a patron of Art, that she will seek to emulate other cities in giving Art instruction? The surroundings of our noble Town Hall, as has been remarked, are to a large extent unsightly. More especially is this so on the Park Lane side of Victoria Square. From the corner of East Parade down to the warehouse of Messrs. Arthur and Co. the existing buildings ought to be cleared away. The site of the lower range—namely, from the one entrance to Park Square to the other—it has been suggested, would form eligible ground for the new Law Courts, and also for a new Free Library and Art Gallery.

THE foundation stone has been laid at Penarth of a bridge to span the Taff Vale Railway, and carrying the roadway over from Railway Terrace and Grove Place. The bridge will be 38ft. in width, and span four railway lines, and will consist of steel girders mounted on masonry. The contractor is Mr. W. T. Taylor, of Pontypridd.

Legal.

AN ARTESIAN WELL DISPUTE.

In the Queen's Bench Division the case of *Thom v. the Urban District Council of Shanklin* has been heard before Mr. Justice Kennedy, without a jury. It was an action by an artesian well engineer against the defendants to recover £253 15s., alleged to be due to him in respect of a contract made with the defendants to continue the boring of an artesian well at Upper Oxlease, near Shanklin, for the purpose of supplying the district with water. In pursuance of the contract the plaintiff continued the boring to a depth of 460ft., when, by direction of the Local Board, he discontinued the work. When the plaintiff had bored to a depth of 330ft. he proposed to insert 4½in. tubing. That was objected to by the Water Committee of the Shanklin Local Board, on the grounds that the tubing was too small. The plaintiff continued the boring for 130ft. without inserting any tubing, and in respect of that length the defendants refused to pay, on the grounds that the work had not been completed according to the contract, which provided that in all matters relating to the contract the decision of the Board's engineer should be binding on the Board and the plaintiff; that payment was to be made by instalments upon the certificate of the engineer that the work had been done to his satisfaction; and that the engineer had not certified that the amount claimed was due to the plaintiff.—Mr. Justice Kennedy gave judgment for the defendants with costs.

AN ARCHITECT'S CERTIFICATE FINAL.

In the case of *Buckland v. Trood*, heard recently in the High Court, the plaintiff claimed as assignee of Messrs. Garner and Lovelock, a firm of builders. In 1896 Messrs. Garner and Lovelock entered into an agreement with the defendant to make some alterations on the defendant's premises. It was provided by the conditions attached to the specification that the works should be executed to the full satisfaction of the architect, and that payment should be made upon the certificate and at the discretion of the architect. On February 5th, 1897, Messrs. Garner and Lovelock assigned to the plaintiff all moneys due to them under this agreement. The first point in dispute was as to various items of the work, amounting in all to £36 17s. 7d., which the defendant alleged to be negligently executed. As to the second point, the question was whether an item of £106 3s. 6d., for granite work executed by a Mr. Whitehead, was due from defendant to Whitehead or to plaintiff's assignors.—Mr. Dickens, Q.C., for the plaintiff, contended, on the first point, that the architect's certificate was final. As to the second point, Whitehead was a sub-contractor under Garner and Lovelock, and had no direct contract with the defendant.—Mr. Greene, Q.C., for the defendant, argued that in all the reported cases where an architect's certificate had been held to be final there had been words to that effect in the conditions, which was not the case here. As to the granite work, it had been agreed by all parties that that portion of the agreement should be cancelled and the work executed by Whitehead for defendant and not for Garner and Lovelock.—After hearing the evidence, Mr. Justice Darling said that, as to the first point, he could not admit evidence contradicting the architect's certificate. That certificate was final, and the defendant was not entitled to go behind it. On the second point he had no doubt that the arrangement by which Whitehead took over the granite work from Garner and Lovelock was entered into with Garner's consent, and on that point the defendant succeeded.—Judgment for the plaintiff for £36 17s. 7d. and costs.

THE Weser, with 563 loads of Jarrahdale Jarrah aboard, has arrived at Grimsby, and the Helena Mens, with 548 loads of the same timber, has arrived at Hull, both vessels to the order of Messrs. McLean Bros. and Rigg Limited, 1, Fenchurch Avenue, London, E.C.

Professional Items.

ABERDEEN.—The work of erecting the new Kittybrewster School is proceeding rapidly. The building is of three stories, and consists practically of two blocks built parallel to each other, but under the same roof. The staircase occupies the centre, between the main parts of the building. The front and side elevations are of hammer-blocked Kemnay ashlar, with a picked course of Kemnay and three courses of rustic, in the darker shade of Tillyfourie, at the base. The back elevation is of sneaked ashlar work. The main windows and the two main doorways are arched, the arches being sprung from short columns.

At a meeting of the School Buildings Committee of the Aberdeen School Board, the question of the appointment of an architect for the new Mile End School was considered. The names before the committee were those of Mr. A. Marshall Mackenzie, A.R.S.A., Mr. A. H. L. McKinnon, Messrs. Jenkins and Marr, and Mr. James A. Souttar. The committee decided by a majority to recommend the Board to appoint Mr. McKinnon.

CLONTARF.—The new station at Clontarf between Dublin and Rabeny, has been opened. It is situated at the north side of the railway bridge over the Howth Road leading from Dublin to Howth, and is solidly constructed of brick. There are two timber platforms, each 450ft. long. On the east side of the line on the low level there are spacious station buildings, containing waiting rooms, a booking hall, offices, lavatories, and a residence for the stationmaster. On the upper platform are a waiting room and ticket collector's office, and on the down platform a waiting room, lavatory &c. Access to the platforms will be obtained by inclined approaches, and the steps have been specially constructed to make the access and exit easy.

DUNDEE.—A party of forty students a few days ago visited the following buildings in Dundee, under the leadership of Professor Gourlay:—The Royal Arch, the old Custom House, the new Royal Bank, in course of construction by Messrs. Peddie and Washington Browne, architects, Edinburgh; St. Paul's Episcopal Church, erected 1853 to 1865 by the late Sir Gilbert Scott; the Albert Institute, by the same architect; the Victoria Gallery, by Mr. Wm. Alexander, the city architect; the new "Pearl" Insurance Offices by Messrs. C. and L. Ower, architect; the Scottish Provident Insurance Offices, new bonded warehouses in the Leagate, new Nurses' Home and Operation Theatre at the Royal Infirmary, all by Mr. Alex. Johnston, architect, Dundee; the new Post Office, by Mr. W. W. Robertson, architect, H.M. Office of Works, Edinburgh; the old Steeple, erected about the middle of the fifteenth century; the old Cross of Dundee, near the Steeple; and the East Church, where the new east window designed by Sir E. Burne-Jones, and executed by Messrs. Morris and Company, was much admired. Another party of former and present students visited Durham for a few days at Easter to measure and sketch the cathedral, the castle, and other buildings in the city and its vicinity, including Finchale Abbey.

ELGIN.—The directors of the Great North of Scotland Railway Company have resolved to construct a new station at Elgin. The plan which have been prepared by Mr. Barnett, the Company's engineer, show a great increase in the platform accommodation, one entirely new platform being intended for the accommodation of the down line. There will be about 400ft. of platforms roofed in with glass and iron. The plans also show considerable additions to the waiting room accommodation and a new refreshment room. The accommodation for the station agent and staff is ample.

FLUSHING, FALMOUTH.—The contract for the renovation and re-seating of the Wesleyan Chapel, Flushing, has been let to Mr. W. J. Moyle, of Chacewater. The whole of the

chapel and gallery will be re-seated in red deal. The architect is Mr. Horace W. Collins, of Redruth.

GARELOCHHEAD.—A new public hall has been erected at Garelochhead. The architects were Messrs. H. and D. Barclay, Glasgow, and the contractors Messrs. R. Aitkenhead and Sons, Greenock; Hutchison and Grant, joiners, Glasgow; James Macredie, plasterer, Greenock; James Maitland, slater, Helensburgh; James Sheddou, plumber, Row; and James Arroll, painter, Garelochhead. Mr. J. G. Wagstaff, Duckenfield, Manchester, supplied the heating apparatus.

KINGSTOWN.—A large mansion and out-offices is in course of erection at Glenageary Road, Kingstown, Co. Dublin. The plans and specifications were prepared by Mr. Cecil Orr, of Dublin; and Mr. Henry Pemberton, builder and contractor, of Killiney and Ballybrack, is to carry out the work, at a cost of about £6000. For the alterations at the Kingstown Town Hall, to cost £700; and for the erection of new municipal offices, at a cost of £6600, Mr. Joseph Berry, C.E., township engineer, prepared the plans, and Mr. Henry Pemberton will carry out the work.

KNOTTY ASH.—A new organ and screen have been erected in St. John's Church, Knotty Ash. The work was carried out from the designs of Mr. Charles E. Deacon, architect, of Liverpool. The organ, which is of large compass, and fitted with pneumatic action, is enclosed in a massive and elaborately carved oak case designed in harmony with its surroundings, and being supported upon carved canopy, springing from the screen, beneath which runs the whole length of the choir stalls. The organ has been made by Conacher and Co., of Huddersfield, whilst all the oak work is from the studios of Messrs. Harry Hems and Sons.

LANCASTER.—The scheme for widening Church Street, Lancaster, has advanced to the commencement of the demolition of the old property behind the "Nag's Head" inn. This inn, and the shops adjoining, it is proposed to set back, giving at the Calkeld Lane end an additional space of 12ft., tapering to 2ft. 6in. at the other end. The premises will be brought up to date in their general arrangement and appearance, the re-erections being of punched stone, with boasted dressings, mouldings, and pediments, and will harmonise with the property on the opposite side of the street. The total contracts are £3212.

LEAMINGTON.—The tender of Messrs. G. F. Smith and Sons, of £6760, for carrying out the work in connection with the extension scheme at Warneford Hospital, which embraces the building of a new wing constituted on the pavilion system, containing two wards, each with fourteen beds, and connected by a bridge with the block opened in 1892.

LEEDS.—A new Wesleyan school-chapel has been built at Lady Pit Lane, Beeston Hill. The building is of brick, with stone dressings. Mr. G. F. Danby was the architect.

LEICESTER.—The foundation stones of the new Primitive Methodist Church and Schools have been laid. The church will accommodate 900 persons, 600 on the ground floor, and the remainder in the gallery. The windows are of tracery work, and glazed with leaded lights in tinted cathedral glass. The schools are arranged in three departments: infants, junior, and institute. The large assembly room is on the ground floor, and is 11ft. wide by 78ft. long. The institute assembly room is on the first floor, and is 60ft. long by 30ft. wide. The walls are faced externally with best pressed bricks, with fine white collington stone dressings. The staircases are of Yorkshire stone, with glazed brick dados. The style of Architecture is Gothic. A limited number of architects were asked to prepare plans in competition, and those of Mr. Harper, Nottingham, was unanimously adopted.

and the works are being carried out under his superintendence. The builders are Messrs. Langton and Son, of Enderby. It is estimated that the cost of the site and building will be covered by £8500.

MARSDEN.—The enlarged chapel and school and new suite of vestries connected with Marsden Wesleyan Chapel have just been opened. The new buildings are built of local stone, and in character with the church. The work has been carried out by the following contractors:—Masons and excavators, Messrs. Whitehead, Fielding, and Bradbury; carpenter and joiner, Mr. James Schofield; plasterer, painter, and concreter, Mr. John Bottomley; plumber and glazier, Mr. Frank Goodall. The plans have been prepared by Messrs. Kirk and Sons, of Huddersfield and Dewsbury, under whose superintendence the works have been carried out.

OLD KILPATRICK.—After being closed for over three months, the Old Kilpatrick Parish Church has been reopened. Amongst the additions to the church is an organ, pulpit, solid oak carved communion table, font of blue Ayrshire stone to match the pulpit, and a peal of bells. The church has been entirely repainted, and new and improved heating apparatus put in. A window of stained glass, representing the Ascension, has been placed in the centre, while two other windows, representing the four evangelists, have been added. Mr. David Andrew, architect, Glasgow, designed the new apse, pulpit, font, &c.

PORTSMOUTH.—Considerable progress is being made on the new blocks of the Portsmouth Hospital, although work on the sanitary blocks was delayed by the non-arrival of the specially made glazed bricks. The main ward buildings of the two blocks A and C are up, and the timbers for the roof of A block are in position, while block C is nearly ready for the roof. Considerable saving has been effected by the substitution of concrete fire-proof flooring with iron girders, for the earthenware lintels and more numerous girders at first specified. Not a single wooden joist will be used throughout the building. The construction and fitting of the heating apparatus has been entrusted to the Portsmouth Water Fittings Company. It has been also decided to go on with the erection of the staircase wings to blocks A and C, which were cut out bodily when the first estimates were first reduced. At the present rate of progress it is believed that the blocks will be completed in about a year's time.

STRATFORD-ON-AVON.—Lloyds Bank (Limited) are about to erect new bank buildings upon the site of their present premises at the corner of Bridge Street and Union Street, Stratford-on-Avon. The plans of the new bank, which have been prepared by Mr. J. A. Chatwin, of Temple Street, Birmingham, show a much larger structure. The elevations in Bridge Street and Union Street will be of Bath stone, and the principal entrance will be at the corner of the streets named, with oriel window projecting over, and surmounted by a short spire. The corner entrance will be recessed, and the oriel window over—a feature of the building—is carried by groins springing out of the keystone of the doorway. There are carved panels between the corner windows. The lower range of windows in Bridge Street will have pilasters and columns between, the middle range contain mullions and transoms, while the top range will be of a more ornate character. There will be six large windows on the ground floor of the banking room, which will be 38ft. by 20ft. All the bank fittings will be of mahogany, and the building will be lighted and ventilated by an inner court, extending the full height of the building, cased with white brick. The style adopted is Renaissance. A low ornamental palisading will protect the stonework from being scored scratched. The builders are Messrs. Collins and Godfrey, of Tewkesbury.

Views and Reviews.

BERLY'S ELECTRICAL DIRECTORY, 1898.

Berly's Universal Electrical Directory for 1898 has just made its appearance. The present volume comprises nearly 1200 pages, and contains about 24,000 names associated with the electrical and kindred industries. Financial information, telegraphic addresses, and telephone numbers are among the new features; and the work shows an addition of about seventy pages, with an increase of over 1100 names. Of its utility there can be no question.

"The Universal Electrical Directory (J. A. Berly's), 1898." 6s. H. Alabaster, Gatehouse, and Co.

"THE STANDARD ELECTRICAL DICTIONARY."

Since the publication of "The Standard Electrical Dictionary," by Mr. T. O'Connor Sloane, neither the student nor the novice has reason to be afraid of the formidable terms and phrases with which the science of electricity has furnished us. The work, the second edition of which is now published, has been thoroughly revised and brought up to date, and includes all the new terms and applications that date from the discovery of what is commonly known as the Röntgen rays. The book, which is liberally illustrated, is a useful and comprehensive work, and certainly deserves something better than the very cheap-looking and ugly cover in which it appears.

"The Standard Electrical Dictionary." By T. O'Connor Sloane. Second edition, with appendix to date. 7s. 6d. Croshy, Lockwood and Son.

"LATHE CONSTRUCTION."

We have received a set of twenty-four coloured plates on "Lathe Construction," by Paul N. Hasluck. The drawings, which are admirably reproduced, are clear and beautiful examples of draughtsmanship, and will commend themselves to all users of the lathe, or to manufacturers of lathe machines. There is, however, an entire absence of letterpress, which we regard as a regrettable omission. The value of the work to the student would have been enhanced by a short descriptive paragraph of each plate. Probably the work is intended to assist the study of some book on the lathe, as, for instance, Mr. Hasluck's "Lathework," and in this connection it will be invaluable.

"Lathe Construction"; 24 coloured plates drawn to scale by Paul N. Hasluck. 6s. Cassell & Co.

"PAINTING ON GLASS AND PORCELAIN."

In "Painting on Glass and Porcelain," the author has dealt very exhaustively with the technical as distinguished from the artistic side of his subject, the work being entirely devoted to the preparation of the colours, their application and firing. For manufacturers and students it will be a most valuable work, and the recipes which appear on almost every page form a very valuable feature. The author has gained much of his experience in the celebrated Sevres manufactory, a fact which adds a good deal of authority to the work. The book, which has been greatly enlarged, is excellently printed, and a very clear and lucid translation has been made by Mr. Charles Salter.

"Painting on Glass and Porcelain." By Felix Hermann. Second, greatly enlarged, edition, 10s. 6d. Scott, Greenwood, and Co., Offices of the "The Pottery Gazette."

The fabric of the new church of St. Margaret, Burnley, is now approaching completion, the roof being on, and the bell in position.

The Fishery Board for Scotland has approved of a plan prepared by Mr. John Rust, city architect, of a laboratory to be erected at the Bay of Nigg in connection with the Board's new fish hatchery.

It is announced that the Inner Temple Buildings Bill, in which powers were sought to build on the frontage adjoining the Thames Embankment, has been rejected by the Select Committee of the House of Lords.

Under Discussion.

THE GLASGOW ARCHITECTURAL ASSOCIATION.

Before the Glasgow Architectural Association Mr. George E. Walker, the Association travelling student, read a paper descriptive of his tour in Yorkshire and Lincoln. Pencil sketches made during the journey were exhibited.—The Rev. David Watson delivered a lecture on "Puis de Chevannes, and the Mural Decoration of Municipal Buildings in France" at another meeting of the Association. The lecturer characterised Chevannes as the greatest mural decorator of modern times, and expressed the hope that the municipality would in the decoration of the municipal buildings, employ Chevannes to initiate the scheme of mural decoration.

BUILDING STONES.

Before the members of the Edinburgh Architectural Society, recently, a lecture was given by Mr. John Kennedy on "Building Stones: their Preparations and Use." The lecturer insisted on the necessity of architects knowing more about the stones they employed, and described and classified building stones, their various dressings, and their special purposes.

PROTECTION OF WATER SUPPLIES.

Mr. A. Kent, in reading a paper on "The Protection of Water Supplies," before the North-Western and Midland District of the Sanitary Inspectors' Association, said that there was no part of the work of a sanitary inspector which exceeded in importance that of the water supply, as the health of a whole community depended upon a pure supply. Public bodies, especially in rural districts, had to contend with great difficulties, the procedure necessary to get a good supply of water being cumbersome, and he contended that more extensive powers were necessary in order that the health of the people may be better safeguarded. Power should be given to local authorities and their officers to enter waterworks from which the public were supplied in order to take samples for analysis.

BRITISH ARCHEOLOGICAL ASSOCIATION.

At the ninth meeting of the session, Dr. Winstone in the chair, Mr. Way exhibited an interesting collection of antiquities recently discovered, consisting of a Romano-British vase, quite perfect, and in fine condition, a food vessel, an urn, several small glass bottles, and the bones of the forearm of a young female, together with a finger ring and several bronze armlets which still encircled the bones at the time of discovery. These were all found in Southwark, as were also the following articles, viz., an iron seal of the thirteenth century, made for some private owner for sealing the conveyance of his land, and two curious examples of the toys made in the shape of a cock, which superseded the inhuman use of the living bird in the Shrove-tide sport of cock throwing. Mr. Way also exhibited a British head and a bone spear-head found in Thames Street. A paper by Miss Russell, upon "The characters of Wolsey's inscription now at Oxford, compared with older ones in Scotland," was read by Dr. Birch.

INSTITUTION OF CIVIL ENGINEERS.

The annual dinner of the Institution of Civil Engineers was given recently in the hall of the Middle Temple. The chair was occupied by the president, Sir John Wolfe Barry. The Master of the Rolls proposed "The Civil Engineers," and said that the practical application of truth to the daily work of life was the common work of both professions. The forces of human nature, however, were more

inscrutable than those of nature with which the engineers were confronted. He was astonished at the vigour of so young a Society. Seventy years ago, he was informed, there were only 156 members of the Society, which had an income of £456. Now the membership was 7000, with an income of £20,000. The institution had not, like others, gone mad on the subject of examinations, which, however valuable in some respects, were by no means infallible tests of the real value of a man.—The President, in acknowledgment, said that the institution was never more flourishing than at the present moment. It was true that the society had not overrated the value of examinations, but they had instituted examinations of such a degree and kind as would secure competency in the profession.

ST. PETER'S CHURCH, ST. ALBANS.

At a meeting of the St. Albans and Hertfordshire Architectural and Archaeological Society recently, a paper by Mr. W. Carey Morgan, on St. Peter's Church, was read in the author's absence. The founder of the church, he said, was Ulsinus, the sixth Abbot of the great monastery of St. Albans, who governed here in the reign of King Ethelred, A.D. 950. Ulsinus built a church upon each of the main roads to his monastery—St. Michael's to the west, St. Stephen's to the south, and St. Peter's to the north. No record existed affecting the last for nearly 200 years after its foundation. As early as the beginning of the fifteenth century, and probably very much earlier, there existed in the churchyard of St. Peter's, besides the cross of Roger de Stoke, two small chapels and probably a hermitage for an anchoress. One of these chapels was known as the charnel chapel, traces of which have been discovered, and the other the "Cornwall's chapel," the site of which has not been fixed. Of the Saxon fabric of the church they had no knowledge, but it was clear from the quantity of late Norman moulded stones which were found during Lord Grimthorpe's recent alterations, that it was rebuilt in less than 200 years. It was, however, difficult to arrive at any definite conclusion as to the date of the tower and the eastern portion of the church before they were rebuilt at the beginning of the present century. He concluded with a criticism on the old glass in the church windows.

WATERSHED AREAS.

At a recent meeting of the Sanitary Institute, held at the Parkes Museum, Margaret Street, W., Mr. E. E. Middleton delivered a lecture, entitled "The Desirability of Making Watershed Areas and Sanitary Districts Coterminous." The lecturer said that consequent on the increase in the size of our large towns the demand for water had led to the upsetting of all preconceived ideas as to the sources from which supplies should be obtained. All the evidence as to water supply and water pollution showed that if areas of supply were to be safeguarded, if rivers were to be preserved from pollution, if the millowners were to obtain the utmost benefit of the power at their disposal, but without injury to the general interests of the population, and if the navigation, if there be any, was to be maintained, the present system of divided authority should be abandoned and a combined general policy should be substituted for it. At present every authority was in conflict with its neighbour. He was strongly in favour of dividing the country into watershed areas for purposes of water supply and drainage, which areas could be coterminous with sanitary districts. In what manner the watersheds should be mapped out was too large a subject to deal with in a single address. The constitution of the watershed authority was also a matter of great complexity, but the body should represent every class and interest, and its duties should consist in the conservation of the river, in the maintenance of its purity, including that of the tributaries, in the encouragement of combination and efficiency in sewage disposal, and in the prevention of floods.

Enquiry Department.

"SPECIFICATION" Enquiry and Legal Departments.

The replies to queries in the "Enquiry" and "Legal" Departments of the "Builders' Journal" being necessarily limited by consideration of space, readers who wish to obtain more complete and exhaustive answers are recommended to apply to the "Legal" and "Enquiry" Departments of "Specification."

Legal advice and opinions on Professional and Constructional matters will promptly be sent through the post.

Rules with regard to these enquiries will be found on page 2 of "Specification."

Terms of Subscription:—12s. per annum, payable in advance, for the first four quarterly numbers, carriage paid to any part of the United Kingdom. Subscribers abroad are requested to remit an additional 2s. 6d. to cover the extra cost of carriage.

I. C. B.—Will you please forward your address.

BUILDING SURVEYOR.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be glad if you would let me know, through your Enquiry Department, whether you consider the knowledge gained in passing the final R.I.B.A. exam. would be sufficient to pass the Institute exam. for building surveyor under local authorities. —Thanking you in anticipation, I am, dear sir, yours faithfully, M. L.

The knowledge gained in working up for the final R.I.B.A. examination should be sufficient to pass that for building surveyor under a local authority, with the exception of a knowledge of the Building Acts, which is, we believe, not compulsory for the final R.I.B.A., but which is so for that of building surveyor. In the Kalendar of the R.I.B.A. you will see what is required for both examinations.

DEPRECIATION AND DAMAGES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—A, the contractor for B, is carrying out extensive building operations to property adjoining those which belong to C, and in working to the drawings, excavates on B's premises and close down by C's wall to such a depth as to cause the wall belonging to C's establishment, the foundations of which are only about 4ft. below floor level, to crack, damaging plaster, framing of window sills, &c., owing to the foundations settling. A has promised to make all good. Cannot C claim compensation for depreciation as well as make A put the damage right? If the extra depth of excavations on B's property had not been done, there is no doubt the damage to C's property would not have taken place.

The architects for B hold the contractor responsible for all damage to adjoining property. A has been told that compensation would be required, but he will not entertain the idea.

Please say if I can compel A to give a reasonable amount for compensation.—Yours faithfully, "REVIEW."

Our solicitor's opinion on the case is as follows:—Upon your statement of facts, C is entitled, in addition to having all damage done made good by A, to damages by way of compensation for depreciation, provided the property has suffered depreciation through the act of A. Before, however, C commences proceedings, he should be satisfied that he can prove that his property has been depreciated in value by A's act.

STRESSES IN ROOFS.

To the Editor of THE BUILDERS' JOURNAL.
DEAR SIR,—Would you kindly explain the method of finding the members in tension, and so in compression, for roof trusses, girders, &c.—Yours respectfully,
G. S.

The method of determining graphically the nature and amount of the stresses in trusses, girders, &c., is to construct stress diagrams, by drawing parallels to the various members, and tracing the strain from a known point: each design requiring a separate and special stress diagram. The following rule briefly may be found of use to ascertain the nature of the stresses in any simple system of framing. From the point where the weight or pressure acts, draw a line in the direction that the pressure is applied, and let the length of the line, measured by any scale of equal parts, denote the pressure in lbs., wts., or tons, as the case may be. From the extremity opposite to the point on which the pressure is exerted, draw lines parallel to the pieces which sustain the strain. The line parallel to the one piece will necessarily cut the other piece, or its direction reduced, either within, or without, the framing. If the line cuts the piece itself, or its direction produced within the framing, then the piece so cut is in compression, but if it cuts the direction produced beyond the framing the piece is in tension. To make this clear, take the example (Fig. 1) of

FIG. 1.

Fig. 1, carrying a weight at its extremity, a being the point where the pressure acts, draw a-w in the direction of pressure, make a-w equal to the weight to scale one-tenth, draw a-b and a-c parallel to the pieces sustaining the pressure, produce the neutral direction lines of pieces S and T to e and d; it will be seen that S is cut within the framing, therefore by the rule it is in compression whilst T is cut without the frame, and is in tension. In Fig. 2 the application of the method to a roof truss is

FIG. 2.

shown. First, to discover the stress in the principal rafters, draw the line a-w in the direction at the weight would move if free, make it equal to twelve parts to scale, draw a-b and a-c parallel to the rafters; these lines cut the rafters on each side within the frame, proving them in compression. To find nature of stress in straining beam, set off on the queen-post a load to scale, through this point draw parallels to straining beam and principal rafter, these cut both members within, showing both in compression. To find nature of stress in the tie beam T, produce direction of tie beam and principal, upon these set off the thrusts to scale; the horizontal thrust is equal to half of the inclined thrust equal to a-c; complete a parallelogram, the diagonal R is the resultant. This force is counteracted by a similar force opposite, and results in a downward pressure at L. Draw the second parallelogram, the side cutting the tie beam produced outside the framing shows it in tension, the side cutting the neutral axis of the wall within shows it in compression. The remaining members are to be dealt with in the same manner.

THE N.A.P. WINDOWS.

[NATIONAL ACCIDENT PREVENTION WINDOWS.]

IT has been a long-standing reproach to the Profession that the windows of our houses have been designed in such manner as to become death-traps to the unfortunate housemaid—and even the more experienced professional cleaner—or, where these have been considered in the use of inside-opening casements, the essentials of a good window, that it should be wind and water tight, have been but indifferently fulfilled. But thanks to the energy and business aptitude of the N.A.P. Window Co. Limited, of 159, Victoria Street, Westminster, who have become the proprietors of some twenty reliable patents relating to the convenient and safe cleansing of windows of every description, winnowing the inventive wheat from the chaff, and thereby earning the gratitude of busy architects, this reproach need no longer exist. The handsome and profusely illustrated catalogue issued by the Company contains within its 450 pages working drawings and details, to large scale, of the numerous varieties of their fittings, adapted for cottage, mansion, hotel, hospital, or public school, interspersed with suggestive hints and time-saving forms of specification relative thereto that will be especially welcome during the extremely necessary, but very ungenial task of translating one's ideas into builders' instructions. Not the least attractive portion of this interesting volume is that embellished with the graceful designs in wrought iron work, contributed by Mr. George Haité, whose valuable co-operation has been secured by the Company for this department of their business. We can only briefly refer to a few of the more important specialties illustrated. The first of these is the N.A.P. patent revolving and sliding sash window. This is the ordinary double hung sash frame provided with the Company's fittings, which enable both sashes to be turned inside-out on pivots, in addition to sliding vertically, thus permitting the outsides to be cleaned within the room. They may also be fixed louver fashion, at any angle desired for ventilating purposes. The weather-proof qualities of the sash have been ensured by an ingenious, corrugated joint between the two portions of the stiles, which interlock with each other, by giving a few turns to a couple of milled-headed screws, projecting slightly from the moulded edge of the stile. Any intelligent joiner could in a few hours transform an existing common-hung sash into a revolving one by aid of the fittings supplied, all the alteration necessary being the cutting off of a 1/4 in. slip from the back edge of each stile, shooting the edge with the corrugated plane provided, and preparing two slips to match to supply the places of those cut off. Then screw on the fittings, and the thing is done. Nothing could be simpler. And the cost? Roughly, half-a-guinea a window. The "Weightless" window frame (also with sliding and revolving sashes) is another useful and ingenious novelty. Here the usual boxed frame is dispensed with and a solid jamb substituted, as there are no weights to be accommodated, the sashes being made to counterbalance each other by hanging them to a single copper chain, passing over a purpose-made pulley sunk in the face of the lining. The comparative gain in the "sight" opening by this arrangement in a Venetian frame is 1 1/2 in. on each mullion; at the same time the frame is stronger and cheaper to construct. Another arrangement for converting a sliding sash temporarily into a casement, for cleaning purposes, is the "Top Bolt" patent. This method dispenses with the cutting of the stiles, the only alteration required being two fine saw cuts through the guard and parting beads, at about the height of the sash apart, and the hanging of the cut portions with small brass hinges. An extremely useful invention is the "Passable Hopper Cheeks" for hospital and school frames. These ventilating hopper frames are always receptacles of dust and difficult to clean, but, with the patent fitting, the moveable pane can be brought down over the lower window and cleaned with ease. No less than eight varieties

of iron and steel patent casements, as supplied by the Company, for various situations, opening both inwards and outwards, are fully illustrated in the catalogue, which we advise every up-to-date architect to become possessed of. The price, we note, is five shillings.

Trade and Craft.

A CORRECTION.

In referring, in our issue of 6th inst., to certain buildings wherein the Key method of warming and ventilation has recently been installed, the Yoker School at Glasgow was, by a typographical error, styled "Gothen." Our Glasgow readers would, no doubt, be a trifle puzzled.

MESSRS. DOULTON AND CO.

Messrs. Doulton, of Lambeth, S.E., the well-known potters and sanitary engineers, have removed their Manchester depot to Temple Chambers, St. James's Square, Manchester, where they have opened commodious showrooms for the display of their manufactures. This change of address has been caused by the large increase in the local demand for the Company's productions. Prominent in their showrooms is a fine display of glazed faience fireplaces and mantles, showing a variety of beautiful designs and colours. Amongst the sanitary fittings is a fine display of baths of the most modern style of design—specially noticeable are the vitreous enamelled baths. Lavatories of a great variety and form, urinals and slop-sinks are a leading feature in these showrooms. A variety of the manufactures are shown which are all of the high-class nature associated with this firm. Architects and all connected with the building trade will find such showrooms as these of great service to them.

A QUESTION OF CONTRACT DEPOSITS.

An interesting case to contractors was recently heard in the Queen's Bench Division. The plaintiff, Mr. Alfred Haslett, a contractor, claimed from the North Sunderland Railway Company a sum of £2611 5s. 6d. for work and labour done and materials supplied, and also damages for breach of contract.—Mr. Lawrence, counsel for the plaintiff, stated that the claim arose out of the construction of a railway for the defendant company. On May 4th, 1896, the plaintiff entered into a contract with the defendants to construct a railway for them from Sunderland to Seahouses, a distance of four miles, for £24,500. The contract was not actually executed, but it was adopted by the board of directors of the defendant company, and the plaintiff was authorised to commence the work. On May 14th the first sod was cut, and the plaintiff began making the line, erecting a quantity of machinery and bringing materials for the purpose. It was a term of the contract that the plaintiff should on its execution deposit with the defendants a sum of £1000 as security for its due performance, and this amount was to be repaid by instalments as the line progressed. It was also a term of the contract that the defendants were to pay the plaintiff £500 seven days after the commencement of the work and another £500 fourteen days after that event. It so happened that the plaintiff, contrary to his expectation, had been unable to raise the £1000 to deposit with the defendants, and so the contract was never executed. The work, however, was carried on by the plaintiff right up to September, 1896, when the defendants gave him notice to leave off, and terminated the contract on the ground that the payment of £1000 by him was a condition precedent to the contract, and as he had not paid that sum they were entitled to withdraw from the agreement.—Mr. Boyd, for the defendants, said that they were quite willing to pay on a quantum meruit for work actually done by the plaintiff, and it had been their desire that the matter should have been referred for the purpose of ascertaining what amount was reasonably due.—Mr. Justice Mathew held that the condition that the

plaintiff should pay £1000 deposit was a condition precedent, and was vital to the contract, and therefore the plaintiff could not recover damages for breach of it. The plaintiff would be entitled to payment for what work he had done, and he thought counsel would be able to settle the amount.—After a long consultation terms were agreed on, and judgment was entered for the plaintiff for £1500, less £200 already paid to him, and £200 brought by the defendants into Court.

MESSES. PEACE AND NORQUOY.

While our politicians are talking about the "open door" in the Far East, the problem, scholastically, may be said to be one not so much of doors as of partitions. There are often cases in which the fact of a room being of wide superficial area is a positive disadvantage instead of a convenience. And yet the same place in which the area to-day is a disadvantage, is pressed to the extreme on the morrow in meeting increased requirements. The great question, of course, is the economical division of the space for the one occasion in such a manner as to permit of a speedy return to the wider area of uninterrupted space when the changing conditions demand such an arrangement. The problem was once all but insoluble, but now it has been for some time one that need perplex nobody. The patent folding partitions of Messrs. Peace and Norquoy, of Manchester, meet a popular demand. They fold up so compactly as to be in no way obtrusive, and when the time comes for use, their erection is simplicity and ease itself. A schoolmistress is as well qualified for the work as a carpenter. The patentees have won several medals and diplomas by the simplicity and effectiveness of their invention, which has been adopted all over the United Kingdom and abroad also. Among the buildings which have been most recently fitted up with Messrs. Peace and Norquoy's partitions are: St. Thomas' and Terrace Road New Schools, Swansea; Northumberland Terrace Roman Catholic Schools, Liverpool; Day Industrial Schools, Edinburgh; New Central Schools, Pitlochry, N.B.; St. Michael's Schools, Wantage, Berks; seven partitions in five schools for the Glasgow School Board, and five partitions to Chapter Room, Masonic Temple, Johannesburg, South Africa. We are informed that during the past four years these partitions have been fixed in more than 700 schools, colleges, lecture halls, public buildings, hotels, board rooms, &c. They have been adopted by over 130 school boards, and have been very generally recommended by architects throughout the Kingdom.

MESSES. WAYGOOD AND CO. LTD.

The name of "Waygood" has come to be regarded as almost synonymous with "lifts" and "cranes." For many years the firm has pioneered in the manufacture of hydraulic machinery of varied descriptions, and their catalogues to-day may be regarded as revealing the most perfected knowledge in their especial province. Messrs. Waygood's lifts and cranes are based, in construction, on the soundest principles, which have been proved by the test of long experience. And, wherever a Waygood lift is encountered, it must, we think, be generally conceded that a completeness of detail and a stability of design have been observed. Almost every conceivable variety of lift or crane is illustrated in the catalogues before us, with electric, hydraulic, belt, or hand power as the motive. Messrs. Waygood have designed and constructed a very efficient gearing for working electric power lifts which, workable by small and inexpensive motors, and, in result, entirely satisfactory, are likely to come more largely into vogue with the advance of electricity. One of these electrical passenger lifts was shown at the Electrical Exhibition of 1892 at the Crystal Palace, running from the main floor to the gallery, and proved one of the features of the exhibition. As a passenger lift, where the height of travel is not excessive, the patent hydraulic balanced direct-acting lift perhaps takes premier

position. It has no overhead gear, and in working is safe and noiseless. In cases where the travel is high, or where economic considerations weigh, the "Side-Rod" suspended lift recommends itself. A notable patent held by Messrs. Waygood is their Economic Multiplying Cylinder, which, associated with either lifts or cranes, remedies an important defect where hydraulic power is used—the equal consumption of water, whether the load raised is at a minimum or at a maximum. As the patent has worked well and truly in experiment, it is more than probable that it will have considerable sway in the future, for its application means an appreciable saving in working. Passing over the variety of hoists manufactured by Messrs. Waygood, we may mention briefly their continuous lift for passengers and goods, suitable for public buildings, offices, factories, and stores; their platform and cellar lifts; and their warehouse or factory lift, as among the other specialties of the firm which have earned general repute.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERGAVERN.—For the erection of a Welsh Presbyterian church, &c., Llanover. Mr. B. J. Francis, architect, Abergaervenny. Quantities by architect:—
H. Smith ... £1,424 0 Jno. Morgan ... £1,240 0
Lewis and Co. ... 1,420 0 T. G. Foster, Abergaervenny ... 1,190 0
Morgan and Evans ... 1,407 7
Thomas and Sons ... 1,245 0
* Accepted.

BIRMINGHAM.—For paving, kerbing, &c., Priory-road, for the Aston Manor Urban District Council. Mr. H. Richardson, C.E., Council House, Aston Manor.—
Jones and Pitt ... £1,053 10 0 W. and A. Heaps, Currall & Lewis ... 952 11 8
J. Biggs ... 950 16 8 Nechells Park-road, Birmingham
G. Law ... 947 17 6 ham* ... 796 16 8
* Accepted.

BRIGHTON.—For the construction of two covered reservoirs, Patcham, for the Town Council.—
Field and Co. ... £9,365 Cooke and Co., 16, Victoria-street, Westminster, S.W.* ... £7,410
Holman and Co. ... 8,557
Satin and Evershed ... 8,254
* Accepted.

GULLANE (N.B.).—For the construction of outfall sewer. Messrs. Belfrage and Carrara, C.E., 1, Erskine-place, Edinburgh:—
A. Brunton & Son £1,254 3 0 G. Mackay & Son ... £967 19 9
A. Waddell & Son ... 1,125 5 0 Robert Marshall ... 961 9 0
L. & W. McDonald ... 1,102 13 0 Lawrence Kelly ... 938 4 3
John Morris & Sons ... 1,045 9 0 Wm. Carragher ... 893 13 0
Richard Wallace ... 1,008 0 0 John Martin, Dundee
J. Kendall ... 969 0 0 fernline* ... 830 15 0
* Accepted.

HASLEMERE.—For erection of new house at Greyshot, for Mrs. Smith. Mr. Arnold Taylor, architect, 2, The Sanctuary, Westminster. Quantities by Messrs. J. Leaning and Sons, Bedford-row, W.C.:—
F. Milton ... £297 0 Chapman and Lowry ... £200 0
Harding Bros. ... 995 3 H. Hutchinson ... 880 0

HAWLEY (Hants.).—For two semi-detached villas at Hawley, Hants, for Mr. J. Batcliffe. Mr. A. E. Sidford, architect, Wokingham. Quantities by Mr. E. Ide, 19, Cockspur-street, Pall Mall:—
E. Field ... £1,486 W. Smith ... £1,275
J. B. Seward ... 1,448 G. Finch, Frimley* ... 1,200
* Accepted.

HUNTLY (N.B.).—For the execution of water supply works, for the Commissioners. Mr. Jas. Barron, C.E., 156, Union-street, Aberdeen:—
G. Rhind ... £2,288 J. Wilson ... £1,055
J. Adam and Co. ... 2,140 J. McConnachie ... 1,643
P. Stewart ... 1,811 J. Hunter Clark, Richmond-place, Elgin* ... 1,550
J. Smith ... 1,782
P. Bisset and Son ... 1,785
* Accepted.

LANCASTER.—Accepted for rebuilding the "Nag's Head" Hotel and three shops. Mr. J. Parkinson, architect. Quantities supplied:—
Masonry.—Robert Thompson ... £1,760 0
Joinery.—Wright and Sons ... 800 0
Slating and Plastering.—Hall and Son ... 865 14
Plumbing and Glazing.—Harrison & Moser ... 286 12
[All of Lancaster.]

LANGPORT (Somerset).—For the construction of covered reservoir, &c., for the Rural District Council. Messrs. Bailey, Denton, Son, and Lawford, C.E., Palace-chambers, Westminster, S.W.:—
Meredith ... £2,455 14 11 Thomas & Webb ... £1,785 3 10
Lott and Walne ... 2,484 17 4 Hawking & Best ... 1,656 17 1
Hole ... 2,009 3 0 Catley ... 1,630 0 0
Roberts ... 1,920 16 0 Smith and Son ... 1,523 10 7

"The Wayfarer" in
a Surrey Village.

THE Wayfarer
sat down for a
moment or two to

look out over the purplish brown heath in front of him. The broad stretch of dark colour was dotted here and there with gorze bushes in flower, and to the right rising from the heath were a number of fir-trees. A narrow road, with deep wheel ruts in its yellow soil, showed the way the Wayfarer had come. At the distant edge, against the beginnings of a wood, nestled a Surrey village. A Roman road—along which a slow but constant stream of leisurely traffic had run for some hundreds of years—divided the village into two parts, that nearest the heath being the older. Behind the wood to the rear of the village, and beyond the pines to the right and left, were brown fields with the young wheat just beginning to break through the ground, and vivid green meadowlands with an occasional clump of trees; rising to where the horizon seems to touch the sky. The Wayfarer now rose from the ground, and, after a little walking, drew near to the village of Witley. The church situated in the older portion stood back some distance from the main road. The spirelet of its stone tower, covered with oak shingles and well within the parapet wall, could be easily seen among the elms by the Wayfarer, as he came listlessly down the village street. The church consisted of a nave and chancel, a small aisle and vestry. A small staircase on one angle of the tower led to the belfry. Although the building had been erected at different times, no one part clashed with another, the village craftsmen had unconsciously done their work well. The nave and chancel, which formed the older portion of the building, was of stone; the aisle and the vestry had been added later, and were built of half timbering and brickwork, placed diagonally between the woodwork. On the left of the lych-gate, which gave access to the graveyard in the front, were the remains of the ancient church house, now used as a vicarage, some new rooms having been added to accommodate the present vicar. At the far end of the churchyard stood the manor house, and further off was a timber building, with brickwork filling in the interstices, two floors in height, called the Moat House. It was till recently—so the Wayfarer subsequently overheard in the "Red Cow," an inn opposite the church—occupied by the author of "Keynotes," but at the present time was tenanted by four young people: one a rising young black-and-white artist; an eccentric novelist, an Art critic, with pre-Raphaelite predilections; together with an architect of "arty and crafty" notions. The moat which had once surrounded this building had long disappeared, to the chagrin of the black-and-white artist, whom the villagers of Witley occasionally found with pickaxe and shovel endeavouring to restore the moat to its original state. These were the principal buildings. The

rest on the side next the heath were half-timber cottages filled in with plaster, built upon a rough stone base, about 3ft. in height. The roofs were of tile, now covered with vegetation, and the chimneys of a simple and sturdy character. On the other side of the road were the new cottages, built by a millionaire, whose house rose from the side of a hill, about a mile and a half towards London. These cottages were of a dark-red brick, harsh in colour, gables finished with elaborately cut bargeboards, a number of moulded brick courses, terra-cotta panels, and some zigzag diamond shapes in another coloured brick on each side of the windows,

Animal Symbolism in Ecclesiastical Art.

THERE is little
need for a re-
viewer to speak

at length of the "merits of a book which, for command of language, ease of style, and exhaustive scholarship, may be heartily recommended to all classes of readers." This from a daily contemporary, addressed to the general reader, had already prepared us for pleasure, yet it gave but a hint of the worth of the book to the more limited classes who delight in the study of Art. An idea of the amount

THE MONASTERY OF MONTSERRAT. VIEW FROM ABOVE THE FUNICULAR RAILWAY.

both ground and first floor. All this beauty of the modern world was, sad to relate, the envy of the villagers living in the old timber buildings; and the Wayfarer gathered, in the course of conversation with the ancient inhabitant at the "Red Cow," that there was a strong tendency for the population next the heath to gravitate to the other side of the road, and take up their residence in the modern world. The Wayfarer on hearing this rose from the bench where he sat with the ancient one, and passed out through the open door of the inn, into the road beyond.

G. LL. M.

of work the author has done in order to reduce the available matter, may be obtained by examining the bibliography with which it concludes. We gather from this that what is original with the author is his style and sense of proportion, for had it not this and that we could not have had such an excellent work. He tells of a mediæval treatise on beasts in which the *symbolisms* (with which we are dealing) "were wonderfully wrought out, and every feature, member,

"Animal Symbolism in Ecclesiastical Architecture,"
by E. P. Evans. Wm. Heineman, 9s.

hue, and habit of the creatures thus allegorised, was made to yield a secret and subtle significance"; and quotes then from the author as follows:—"What Holy Writ inculcates on the learned, pictures impress upon the ignorant; for, as the scholar delights in the subtlety of Scripture, so the soul of the simple is pleased with the simplicity of pictures." Then follows Mr. Evans' own comment:—"But this simplicity was often lost in a puzzling maze and winding labyrinth of allegorical and mystical interpretation, which it would be impossible for the wayfaring man, even though he were not a fool, to thread without the 'Physiologus,' or some later elaboration of it as a clue." The "Physiologus," it should be explained, was the predecessor of our Cyclopædia, and dates from the second or third century. It was rather a compendium, or digest, of what knowledge there was at the time, than the production of only one man. "It was compiled," Mr. Evans informs us, "by an Alexandrian Greek from a great variety of sources, and doubtless embodied much of the priestly wisdom and esoteric science of ancient Egypt." The student of Law is aware that the usual result of codifying a complex of Laws is to impede progress, and the remark applies as well to the subject matter of knowledge at large. The "Physiologus" once published remained the standard work upon Natural History from the time of its first appearance until well into the Middle Ages. What interests us more particularly is the way in which the facts, if facts we may call them, were regarded by the Christian fathers, and entertaining indeed is the way in which they in their wisdom agreed to represent them. The most insignificant animal had either virtues or vices which supplied the preachers of the day with their texts. Take, for instance, the elephant, which, however, is rather a big one. The simple fact is, and hereupon we all are agreed, that once on his knees he cannot get up again. "What signifies this, but the *Fall*?" says the preacher. As to what "tempted" the elephant we have no information. As with animate, so seemed it to be with inanimate objects, but space will not permit of any further quotation. It may be remarked, in conclusion, that forasmuch as a building is sacred the artist must utilise symbols of sanctity. To each is an emblem appropriate, and often it happens that in the animal kingdom we find the idea of Virtue incorporate. The reader of the chapter entitled "Symbolism Superseded by Satire" will learn to clearly distinguish the work that "emblematises" the abstract virtues and vices from that which stigmatises hated or despised individuals of particularly objectionable classes. But there is truly inexhaustible matter in the humours, conscious or unconscious, of Mediaeval workmen, and the writer of this most excellent book has furnished the intelligent reader with the key to it all. We conclude, as we began, with an extract from a previous notice: "It is one thing to identify beasts and birds when we see them, and another to be able to say what they are up to, or after. The men of the Middle Ages, to whom natural phenomena were strangely portentous, saw more than we see in a fox—to take only one instance. Foxes in holes are types of the Devil. Foxes in crows are itinerant friars (who were detested by the Regulars, and they in turn by the Secular clergy). Amongst Reynard's auditors are the bear, the ape, the he-goat, the griffin, the cock, the hen, the stork, the sow, and the cat, which are either holding prayer books or psalters, or singing hymns from sheets of music, while the unicorn plays the bagpipe, and the ass performs on the harp."

E. R.

ART IN GREAT CITIES.

BY SIR WYKE BAYLISS.

BEFORE the Royal Society of British Artists, the president, Sir Wyke Bayliss, recently delivered a lecture, entitled "Art in the House of Her Friends—a Special Address to Dwellers in Great Cities." The lecturer said that as Art was the science of beauty, so sanitation was the science of health, and health and beauty were inseparable. The progress of Art in our country and the free development of some of its finest characteristics had been arrested and seriously impeded by the foul condition of the atmosphere of our great cities. The arrangements of our dwellings were not conducive to the development of the beautiful: the law of beauty, as well as the law of sanitation, was that things were right only in their right place. If we could do nothing better with works of Art than to smoke them black, artists would probably furnish us with works suitable for that purpose. Any great scheme for

THE DEVELOPMENT OF NATIONAL AND HISTORIC ART

was practically hopeless so long as the state of things continued. To find a remedy they must not look to the artist—Art was in the house of her friends, and artists looked to them to see that the house was habitable. Had they ever reflected on the injury done to Architecture by the insanitary condition of our great cities, and of London in particular? They could only form a faint idea of the pristine beauty of Westminster. Only on the Continent could we see the wondrous architectural beauties bequeathed to us in bygone ages. Here, in London, we created the darkness by the innocent process of cooking our mutton-chops. He was ready to admit that London must have its mutton-chops, but it was shameful that the method of their cooking should deprive the artist of the use of marble and mosaics. It was not the climate which the artist had to fight, but the climate plus dirt. It was dirt which carried foolishness into the councils of our building committees. What had become of the few works of Art which adorned London? They looked as though they had suffered a martyrdom and were black with slime. Under these

DEPRESSING INFLUENCES

Art could not flourish. Its neglect meant ignoble buildings; railway stations and street hoardings plastered with hideous posters, which "crushed" our eyes so that we could not lift them from the mud of the streets; and pictureless walls in dwelling-houses covered with a rigmarole of paper designs. These were not necessary evils; and once the city was relieved from the nightmare of dirt and smoke, artists might be trusted to retrieve the national honour and to bring Art not only into the public places, but into the homes of the people. Let sanitation lead the way and they would see the return which Art could make to its friends. Art could not do everything, but it could do much to increase the sum of human happiness, and happiness was one of the most powerful of disinfectants. No one could calculate what we lost as a nation by the discouragement by dirt of the noble Art of mural painting. It was for the friends of Art to provide the remedy. In conclusion Sir Wyke Bayliss said the time might yet come when an artist's work would be actually immortal.

A STAINED glass window has been placed in St. Germans Parish Church, Plymouth. The centre light represents St. Thomas the Apostle, surmounted by a crown. The right hand light portrays St. Thomas Aquinas, bearing in his hand an open volume. On the left of the figure of the Apostle is a representation of St. Thomas of Canterbury, Archbishop and Martyr, vested as a bishop, and bearing his crozier and pontifical. The tracery in the upper part of the window is filled with figures of angels. The window was designed and executed by Mr. Fouracre.

ANCIENT EGYPT.

THE TOMB OF AMENOPHIS II.

SOME interesting details of the tomb of Amenophis II., which was discovered about three weeks ago, have just been given in the Times. Its Cairo correspondent says:—"As a sequel to this discovery of the tomb of King Thothmes III. at Thebes, M. Loret, Director-General of the Antiquities Department, has discovered and opened the tomb of Amenophis II., a king of the eighteenth dynasty, who reigned some 1500 years B.C. The find is amongst the most interesting ever made in Egypt, as, although the jewellery, &c., were rifled from the tomb probably during the twentieth dynasty, the mummies of Amenophis and seven other kings are intact. The tomb is entered by

A STEEP INCLINED GALLERY,

which terminates in a well of some 26ft. in depth, and, this obstacle surmounted, the entrance to the King's sepulchre is reached. In the first chamber the body of a man is found bound to a richly painted boat, his arms and feet tied with cords, a piece of cloth stuffed as a gag into his mouth, and marks of wounds on the breast and head. In the next chamber are laid out the bodies of a man, a woman, and a boy. None of the four bodies have been embalmed, but owing to the dryness of the atmosphere they are all in the most complete state of preservation, with the features perfect; and, although they evidently met with violent deaths, they have the appearance of being asleep. The hair upon each is luxuriant, and the features resemble to a marked degree those of the fellaheen of the present day. The King's tomb is

A CHAMBER OF MAGNIFICENT PROPORTIONS,

in perfect preservation. The roof, which is supported by massive square columns, is painted a deep blue, studded with golden stars, and the walls are entirely covered with paintings, the colours of which are as vivid as if laid on only yesterday. At one end of this chamber, in an excavation sunken several feet below the level of the rest of the floor, is the sarcophagus of the king, placed upon a massive block of alabaster. The sarcophagus is of sandstone, artificially coloured a bright rose hue, and contains the mummy intact, with chaplets of flowers round the feet and neck. In a small chamber to the right are nine mummies, two of them bearing no name, and the others those of the Kings Thothmes IV., Amenophis III., Set Nakht, Seti II. (supposed to have been the Pharaoh of the Exodus), Rameses IV., Rameses VI., and Rameses VIII., who all reigned between about 1500 and 1150 B.C. The tomb is that of Amenophis II., for whom it was built, and is supposed to have been opened later to receive the mummies of the other kings, probably to save them from violation. The floors of all the chambers are covered with a mass of objects—

STATUES, VASES, WOODEN MODELS

of animals, boats, &c., requiring immense care in sorting for removal. The whole constitutes one of the most impressive sights that can be imagined. For the first time on record, the body of an Egyptian king has been found in the tomb prepared for him, as previously discovered royal mummies had been removed from their tombs and secreted for safety at Deir el Bahari. Possibly this discovery of the bodies of murdered victims in a king's tomb may throw some light upon the vexed question of human sacrifices which now divides Egyptologists. The Public Works Ministry has requested M. Loret to remove only the smaller objects and to leave the mummies and bodies in their present place. The entrance to the tomb will then be built up until next winter, when iron railings may be placed to prevent injury from touching by visitors, whilst affording them the unique sight of the lying in state of a king who reigned over 3400 years ago."

SPAIN:

Its Picturesque Cities and Monasteries.

II. THE MONASTERY OF MONTSERRAT.

By F. HAMILTON JACKSON.

THE Monastery of Montserrat is built upon an isolated mountain some thirty miles to the north-west of Barcelona, which consists of a mass of grey conglomerate twenty-four miles in circumference, and which, at its loftiest point, a peak called San Geronimo, is more than 4000ft. high. It was called Mons Serratus, or Monte Serrado, either from its jagged appearance, something like the teeth of a saw, or because the Eastern face is split by a chasm as if sawn, which the Spanish legends say occurred at the time of the Crucifixion. Its pinnacles and pyramids of most strange shapes are said to resemble a mountain of hard volcanic tufa which is to be seen in Iceland, between Akureyri and Kalmanstunga; but, on a near view of the great fragments which in places overhang the road, the rock looks almost as if it were made by man's hand, a concrete of large pebbles not very well compounded. Yet there are several quadrangular blocks as large as a house which one passes on the road, supported at their lower corners by dwarf walls of considerable age, and which show no signs of disintegration.

The nearest station to the monastery is on the line to Zaragoza which goes by way of Lérida. From that station, Monistrol, the traveller has the choice of three ways of reaching it, first by a funicular railway, which makes pilgrimages easy to the rich, secondly on mule back or by carriage, and thirdly on his own legs, in the two latter cases making use of the excellent road, for the roads to convents and pilgrimage places have always been made smooth and easy in Spain. This road winds up and up, rounding spur after spur of the mountain and zig-zagging up difficult ascents, till, at some 3000ft. above sea level, it reaches the little rift occupied by the monastery and its dependencies.

It is quite invisible from below. One can see here and there a little piece of the embankments which support the railway, with an occasional telegraph post far away above one, with a feeling of wonderment and doubt as to the possibility of getting up so high, but the last half hour of the road ascent is above the railway, and one looks down on it with a calm feeling of superiority.

As we left the station at Monistrol the mountain faced us, stupendous in its size and mystery, for it was afternoon, and the sun was behind it, while a slight mistiness in the air disguised detail and added distance and apparent size. At first the road ran down hill with devious curves, but a rough footpath across a vineyard enabled us to take a short cut towards the banks of the river Llobregat, upon which stand several mills which afford employment to the inhabitants of a little village through which the road passes. Beyond this it turns to the right, still following the river bordered with trees, between which is seen a stretch of green sward upon which sheep feed, and then the sparkle of the water, on the further side of which rise precipitous banks, sparsely studded with trees, and with the mountain closing the vista. After passing under the funicular railway and by a mill, the road rises steeply to a quaint bridge, with three arches high above the river, crossing which we enter Monistrol proper. The streets are narrow and tortuous, as well as steep, and our path turns suddenly to the left up an alley, which it seems impossible can lead anywhere, but which soon conducts us past the public washing-place, and a little house, in front of which the vines have already set their grapes, though it is only the last day of April, to the main road which skirts the village. From this point it is one steady pull up the mountain, rising higher with each successive stretch of the road, and with a constantly widening view, till, on

approaching the monastery, it embraces the distant Pyrenees, blue on the horizon in one direction, and the Mediterranean as blue as they in another, while all around hills covered with a warm red soil alternate with rich valleys, among which lie scattered Manresa and many villages, and at the foot of the mountain the Llobregat winds through the village of Monistrol, which we passed on our way.

The ravines, down which the storm waters stream when it rains, are wild and uncultivated, though green with grass to a considerable extent, but the gentler slopes are terraced and irrigated, and are planted with vine and olive trees as well as with annual crops. Except for the signal-houses on the railway, but two inhabited houses, both Fondas or inns, are passed after leaving Monistrol until we reach the monastery (though two more, suburban villas apparently, are being built some half hour from it), and scarcely a human being is seen except a few scattered peasants engaged in agricultural labours or herding sheep and goats. The birds, however, make their notes heard every now and then, for there is plenty of cover for them among the olive trees, though the greatest luxuriance of vegetation, reversing the usual experience when mountain climbing, is towards the top of the mountain, where in every place where soil can rest evergreens grow and numerous flowers and bushes, many of them peculiar to the place, tempt the botanist to explore, and may lead him to venture into perilous situations, for above the Monastery the precipices very often plunge down sheer for a thousand feet or more but a short distance from the mountain paths which must be followed; and their edges are not seldom concealed by the luxuriance of the

vegetation. The air is clear and exhilarating, and though, even at the beginning of May, the heat is great, exertion is not exhausting as it is in the plains below, and many of the inhabitants of Barcelona make the pilgrimage to Montserrat several times in the course of the summer, just as our town-dwellers escape from the city heats to the seaside to be braced and invigorated.

In this delightful situation, a rugged and dreadful wilderness as it was then considered, the first hermit, S. Asicle, built his hut in the sixth century, and since that time many other hermits have dwelt here who fled from the world for various reasons. Most of the hermitages were burnt by the French; they were fifteen in number, of which eleven formed a "via sacra," ending at the summit of San Geronimo—each was separate and with difficulty accessible. The anchorite who once entered one never left it again.

Just before reaching the monastery, the conduit which brings water to it may be seen, carried on a series of slightly projecting arches as it skirts the precipice which overhangs the road, and at the turn is a little plateau on which stands an ancient oratory, and from which the chapel built over the "Virgin's Cave" may be seen, together with an extensive view of the Valley of the Llobregat, and the lower spurs of the mountain on this side. A little further, under the walls of the church, which rise to an enormous height above the road, is the cross which marks the place beyond which the holy image refused to move when being carried towards Manresa, as an inscription states—"Aqui se hizo inmovil la santa imagen en 880." It stands upon the parapet, and is surrounded by trees which rise

FACADE OF THE CHURCH, MONTSERRAT.

from the bank outside, which slopes steeply towards the valley. Next, the station of the funicular railway is passed, and a waiting place with refreshment stall attached (quite in the English manner), where mules may be hired for the trip toward the top of the mountain, which rises 1000ft. higher still, and where a few carriages also wait. Then the road, turning sharply to the right, passes under the entrance gateway, still ascending rapidly. On the left is the wall which supports the road to the Fonda, and to some of the lodging places for pilgrims—more of which are on the right of it also, for 2000 beds can be made up each night. Proceeding straight forward one reaches a small plaza, in which, in the morning, a little market is held. This overlooks the valley on the right and the drying-ground, where the sheets are exposed after washing, while on the left is to be seen the small remnant of the ancient monastery—one side of a fifteenth century cloister, with a ruined wall at right angles to it, containing a Romanesque doorway and a

curtains for two chairs and a small table—a window, and an iron washstand with a water-pot of quaint shape. The beds are excellent—spring mattresses and good blankets and a coverlid with the arms of the monastery woven into the material. These arms consist of a peaked mountain with a saw resting on its topmost peak, of the kind which is tightened by the twisting of a cord, and form a well-designed ornament, being surrounded with scroll work something like an heraldic mantling. The floors are tiled, and the windows can be opened wide; moreover, there is plenty of water for washing! In the month of May it is difficult for travellers to find accommodation, so great is the number of pilgrims who still resort to the holy image, though Sept. 8th is the day specially dedicated to this Virgin. The Fonda is only a place for providing food and drink—not for lodging. A portion of it was erected in 1757, as stated by the date carved on the lintel of the principal doorway, but it has been enormously enlarged, and now consists of three stories, the topmost of which

GREAT ART WORKERS OF THE CENTURIES.

THORWALDSEN: SCULPTOR IN STONE.

THE great facilities which the harder lime-stones, generally termed marble, afford for the exercise of the sculptor's art were very early discovered. Many remains of Egyptian statues of stone are extant, and the large sculptured slabs discovered by Sir H. Layard amongst the ruins of Nineveh, and now in the galleries of the British Museum, are mainly of alabaster. The ancient Greek sculptors—pre-eminent in their profession—were especially fortunate in the contiguity of quarries of white marble peculiarly fitted for purposes of statuary. From the quarries of Pentelicus was obtained that beautiful pure white marble in which the immortal Phidias carved his divine conceptions. This greatest of all

window or two, the whole raised on a paved platform, to which access is gained by two flights of steps, between which is a pump. This cloister is now utilised for the sale of photographs and mementos of pilgrimages.

Facing the plaza are the entrances to the atrium in front of the church, another cloister now used for the accommodation of pilgrims, the east side of which is formed by the façade of the church itself. The lodgings for pilgrims are called "hospederias" or "aposentos," and are placed under the protection of various Benedictine saints. Thus in the atrium are the aposentos of San Luis Gonzaga, of San Leandro and San Fulgentio, of Santa Escolastica and Santa Gertruda; while nearer to the Fonda are the hospederias of Santa Teresa de Jesus, of San José, and the aposentos of the Venerable José de San Benito, and of San Alfonso, scarcely any of them names of great renown. The arrangement of the buildings is as follows:—There is a fireproof staircase from which long corridors are entered at each story, which give access to the rooms. Each room has two beds—in a little curtained alcove—and just room enough outside the

is a large *salle-a-manger*, accommodating 200 or more persons at a time, while the other floors are filled with small tables, and should accommodate as many more—when allowance has been made for a *café*, which occupies a large part of the ground floor. Food is good and plentiful.

(To be continued.)

A NEW window in the Priory Church, Malvern, has been unveiled. The cost of the window was £236. The window is at the back of the altar in St. Ann's Chapel, which is situate on the south side of the church. The history of the Priory in brief is depicted in the window, of which Mr. C. E. Kemp was the designer.

The work of removing the wooden staging in the Thames a little to the west of Blackfriars Bridge, which for the last four years has formed the chief base for the operations in connection with the construction of the City and Waterloo Railway, has been commenced, and in a few weeks' time the "island" will be a thing of the past.

sculptors flourished during the fifth century before our era, and some of the productions of his chisel, brought by the late Lord Elgin from the Parthenon, are in the British Museum, in the collection known as the Elgin marbles. Besides this supreme artist, Praxiteles, Scopas, and others worthily maintained the Art of Greece; and later, during the Classic period, Rome produced some sculptors of eminence. During the Middle Ages, although a wealth of carving of ornaments and flowers was lavished on the stone arches and capitals of minster, church, and abbey, there was but little statuary sculpture accomplished—at least, worth preserving. With the Renaissance, however, the Art again revived, and men like Michel Angelo were worthy rivals of

THE BEST ARTISTS OF ANTIQUITY.

In more modern times there has been again a falling off, although certain artists, such as Canova, Flaxman, and Thorwaldsen, rank very high, and it is the last of these whom I have selected as the subject of this sketch. Before, however, proceeding to my subject

REMAINS OF THE ANCIENT MONASTERY, MONTSERRAT.
SKETCHED BY F. HAMILTON JACKSON.

marble block that it did to the clay figure, the sculptor knows that the boring is correct. He then makes a measurement of another prominent portion of the clay figure, and bores a corresponding hole in the marble block. By this means, when the workmen have done with the block, it has a series of holes drilled in it, the inner extremities of which correspond with all the salient points of the desired statue. The sculptor can now proceed to chisel away the superfluous marble with confidence, as he is aware that wherever he reaches the end of a hole he must proceed with the greatest caution. Of course, any ordinary workman can do the drilling, which I have just described, but the chiselling away of the marble must necessarily be done by the artist. The only sculptor known to fame of whom it is asserted that he dispensed with this troublesome and dilatory process is Michel Angelo, who is said to have cut out his statues from the stone block without any preliminary preparation. It is very doubtful, however; but there is an unfinished statuette of St. Sebastian by the great sculptor in the South Kensington Museum which seems to support this statement. To revert, however, to Thorwaldsen. Although his family is said to have descended from the Danish King; Harold Hildebrand, the father of the subject of this sketch, was Gotschalk Thorwaldsen, and the maiden name of his mother was Karen Grönlund. Albert (better known in Denmark as Bertel) was born in 1770, and his

early predilection for Art derived its origin from the occupation of his father, who supported his family by the execution of

ROUGH CARVINGS

for the figure-heads of vessels in the dockyards of Copenhagen. "For the earliest information concerning his son," says Mrs. Rowan, "we are indebted to some old ship carpenters of Copenhagen, who related that they perfectly well remembered him as a handsome, fair-haired boy coming to visit his father at the dockyard, and that he was loved by all who saw him." The views of Gotschalk Thorwaldsen with respect to the future career of his son did not extend beyond qualifying him to act as an assistant in his own trade, and it was with some difficulty that this determination was by the earnest importunity of friends commuted to the better purpose of conferring upon him an artistic education. His studies commenced in his eleventh year at the Academy of Copenhagen in 1781, under the instruction of Hans Cleo, and, after twelve months of preparatory application (an unusually short period), he was removed to the life class. Three years were devoted to the exclusive study of the human figure, after which, for the first time, casts from the antique were placed before him, a course of study which seems to reverse the order of progress laid down in the existing schools of Europe. In 1786 he began to work in clay. The Academy was at this time under the direction of the sculptor Wiedewelt, but it was to Professor Abildgaard, under whose immediate instruction Thorwaldsen prosecuted his studies, that he was indebted for an affectionate and active interest, which, operating upon his own intelligent assiduity, enabled him to gain the silver medal after an attendance of one year at this school. When discoursing of his student days, Thorwaldsen dwelt with satisfaction upon one result of this triumph, which was the respectful prefix of Mr. to his name by his religious examiner

THE MEMORIAL CROSS, MONTSERRAT. SKETCHED BY F. HAMILTON JACKSON.

proper, I would beg leave to say a word upon sculpture generally. Few people, save that small minority who have given the subject special attention, are aware of the difficulties attending the production of a fine statue in marble. Many folks actually suppose that the sculptor takes his stand, with a mallet in one hand and a chisel in the other, before a big block of stone, attacks it boldly, and rapidly chisels out a god or a nymph or other subject after an ideal only existing in his own brain. Alas! the actual process is much more prosaic and extremely slower than this grand off-hand style would be, the usual procedure of the sculptor being somewhat after this fashion. Having thought of his subject, and how he should treat it, a full life-size drawing is generally made. From this the sculptor models the figure, full size, in clay, which is permitted afterwards to get dry. The block of marble of sufficient size and the clay model are then placed side by side in the atelier or studio. An apparatus is next brought forward, consisting of a tall upright firmly fixed in a heavy foot. A horizontal arm slides upon this upright, and can be fixed at any elevation, and this arm can be extended more or less in a horizontal direction by a slide. This instrument is placed before the clay figure at a certain exact distance, and the arm is adjusted both vertically and horizontally until it touches some prominent part of the image, say an outstretched hand or the tip of the nose. At precisely the same height from the ground one of the sculptor's assistants proceeds to drill

A HOLE IN THE MARBLE.

When he thinks he has bored to a sufficient depth he brings the gauge mentioned to the correct distance before the block, and inserts the arm in the position in which it touched the clay figure into the hole which he has made. If the arm will go quite into the hole while the foot of the gauging apparatus occupies the same relation to the

THE MONASTERY OF MONTSERRAT. THE ENTRANCE GATEWAY, FROM WITHIN.

on having ascertained that he was the Thorwaldsen who had distinguished himself in the Academy competitions. It may be noted that Thorwaldsen soon made

WONDERFUL PROGRESS IN SCULPTURE,

but could be so little persuaded to attend to other studies, that he reached the age of eighteen scarcely able to read. In his twenty-third year he obtained the great gold medal, to which a travelling stipend was attached, and thus he was enabled to visit Rome, where, encouraged at first by the patronage of Thomas Hope, the English banker, he soon reached the highest degree of celebrity. Denmark became proud of her son, so that his visits to his native town in 1819 and 1837 were like triumphal progresses, all the city going forth to meet him, and lodging him in very fine style at the public expense, but his heart always clung to the Eternal City, which continued to be the scene of his labours. Of his many works, perhaps his noble lion at Lucerne is the best known. He never married, though he was long attached to a member of the old Scotch house of Mackenzie, and he died on a visit to Copenhagen in 1844. As specimens of Thorwaldsen's style, it may be mentioned that one of his most characteristic works is a figure of Hope, in which the arrangement of the drapery is both careful and effective. This work was realised according to the spirit of a relic discovered at Ægina, because Thorwaldsen, with his profound reverence for Classic Art, did not think himself justified in attempting to alter any type which had been accepted by the Greeks and Romans for centuries. This statue was executed in marble in 1829 for the Baroness von Humboldt, and a copy of it was placed on her tomb

IN THE GARDEN

of her palace. Other grand works are a group consisting of Ganymede feeding the eagle of Jove—the dimensions of this are 3ft. 4in. by 2ft. 7in.; the disposition of the lines of the work cannot be excelled—and a truly magnificent figure of "Christus Consolator" in the Fru Kirche, or Lady Church, at Copenhagen. Certainly no more sublime and adequate representation of the Redeemer of the World than this gracious and truly magnificent

realisation has ever been produced by artist, ancient or modern. Just so—so winningly gracious, so divinely beautiful, we can imagine that Jesus appeared as He uttered those few words which have often consoled heartbroken mortals: "Come unto Me all ye that are weary and heavy laden, and I will give you rest." Few sculptors have the good fortune to be represented by such grand extant works as Thorwaldsen, whose countrymen hold his memory in great respect, and even veneration. Many of his best works adorn the Fru Kirche of the capital. At Copenhagen, too, is to be found the Thorwaldsen Museum, of which the Rev. J. G. Hare thus sympathetically writes: "In accordance with Thorwaldsen's own wish, he rests in the centre of his works. His grave has no tombstone, but is covered with green ivy. All around the little court which contains it are halls and galleries, filled with the mar-

vellously varied productions of his genius, arranged in the order of their execution, casts of all his absent sculptures, and many most grand originals. Especially beautiful are the statues of Mercury, modelled from a Roman boy, of whom the original is in the possession of Lord Ashburton, and the exquisite reliefs of the 'Ages of Love' and of 'Day and Night'—the two latter resulting from the inspiration of a single afternoon. But all seems to culminate in the great Hall of Christ, for though the statues here are only cast from those in the Fru Kirche, they are far better seen in this well-lighted chamber than in the church. The colossal figures of the Apostles lead up to the Saviour in sublime benediction; perhaps the statues of Simon Zelotes and the pilgrim St. James are the noblest amongst them." In conclusion, it may be remarked that there is in the South Kensington Museum a plaster cast of a very fine work of Thorwaldsen's. This is a frieze representing the triumphal entry of Alexander the Great into Babylon. The original is in the Royal Palace of Christiansborg, Copenhagen. This cast was presented to the Museum by the Danish Government after the Exhibition in 1862, and students will derive a valuable lesson in carefully studying its magnificent details, as it unquestionably shows the great Danish sculptor in one of his very best styles.

W. N. B.

A LOCAL GOVERNMENT BOARD inquiry has been held at Colchester into the application of the Town Council to erect a new town hall, from the designs of Mr. J. Belcher, at an estimated cost of £36,000.

MONTSERRAT: FROM THE ATRIUM, LOOKING OUTWARDS.

STAGE MECHANISM.*

BY EDWIN O. SACHS,

AUTHOR OF

"Modern Opera Houses and Theatres," etc.

A MOVEMENT known by the name of "Stage Reform" has of late years received some attention in this country. It originated some twenty years back in Austria, with the primary object of encouraging the greatest possible imitation of nature in the *mise-en-scène* of opera and drama. The rudiments of Art, as understood by painters, sculptors, architects, and the cultured public of the day, were to be applied to the stage, and a true Scenic Art was to take the place of the nondescript, irrational and frequently coarse mounting previously given to plays. To facilitate the efforts of the scenic artist, the fullest application of our modern sciences (notably of mechanics and hydraulics) in the interest of

"STAGE REFORM"

was considered essential, and the introduction of recent methods of lighting was also deemed necessary. The numerous fatal conflagrations which had originated on the stage, caused the question of protection from fire to be closely associated with the movement, while the frequency of dangerous diseases among the members of the dramatic profession preserved the claims of hygiene from neglect. The movement, as I have said, originated in Austria soon after the terrible "Ring" Theatre fire at Vienna; and, on account of the prominence accorded to protective measures against fire, much headway was at that time made in German-speaking countries. Able exponents were found among leading artists, and stage-managers, architects, engineers, firemen, and last, though not least, the Government and municipal authorities, interested themselves in the matter. Since then the movement has not only surely and gradually developed throughout Austria and Germany, but also spread beyond the frontiers of those countries. Concurrently, some quite

INDEPENDENT MOVEMENTS

also originated amongst several other nations, and, though the purposes of these were not identical, they were very similar. Throughout Europe a transitional period may be said to have begun for the stage. Up to the present time, however, this period has nowhere attained its desired termination in any generally recognised reform. No definite new era has yet been opened, even in the countries where the movement first obtained a footing. Experiments have been numerous and various, and the failures have almost outnumbered the acknowledged successes. The boldest experiments, with their valuable achievements and costly failures, have, however, now been made, so that little remains to be done except the practical and systematic application of the experience gained. I may here at once say that I see no reason why the experimental or transitional period of the movement should not now be superseded by

A NEW AND DEFINITE EPOCH,

more especially if the matter is taken up by men who are free from fads of their own. The primary object of the originators of the movement—i.e., the closest possible imitation of Nature—has in several instances already been attained; but the Art world, and the cultured also, have found that this generally means crude realism. The mystery of the *mise-en-scène*, so necessary to a good scenic picture, is lost, and much also of the so-called "feeling" of the spectacle is lacking. Modern science and the most recent methods have already been employed to some purpose in the interests of the mounting, but stage managers and experts have found that an extreme modernisation of the scenic artist's auxiliaries often means more complication and uncertainty than was formerly the case. The expenditure incurred by extreme reform on the stage has also been found to be disproportionate to the

advantages gained therefrom. Both in the effects to be obtained, and in the methods to be adopted, practical reform is now gradually taking the place of radical reform. There can be no doubt that the exponents of the extremist movement have given the necessary impetus towards the improvement of the scenery, and future generations will be greatly indebted to them. As is usually the case, however, with any radical reform, the originators of the movement are scarcely likely to see their proposals adopted in their entirety. Nevertheless, they may be well satisfied that a moderate and practical outcome of their efforts is assured. And this is a great deal when we consider to what an extent the stage clings to tradition and convention, and repudiates any interference from outsiders, and how sweeping the proposed reforms appeared twenty years back. In England, the primary object of "stage reform," the imitation of Nature in the *mise-en-scène* of both opera and drama, has certainly found a fair amount of favour. This, however, is virtually due to the manner in which the public have associated the movement with that crude realism which has of late met with so widespread an appreciation in all branches of Art and letters. There has been no outcry against the

INDIFFERENT MOUNTING OF A PLAY.

and the realism of a spectacle has generally been more appreciated by an audience than its merits as a work of Art. "Stage reform" in this country is still associated with the sensational shipwreck, the race, or some other exciting item of the programme, and any popularity of the movement is practically due to the rendering of such realistic scenes. There have not yet been many instances where Art alone has helped the movement; but for that matter, perhaps, we have not seen many examples of a *mise-en-scène* on truly Art lines. With very few exceptions on a small scale, no extreme reform has been attempted in this country as it has in Austria and Germany. This is largely due to the fact that our actor-managers have to rely on their own purses or on those of some speculative financier, instead of having a certain proportion of public funds placed at their disposal. Our managers cannot afford expensive experiments. Too much risk is involved in the sudden departure from

TRADITIONS AND CONVENTIONAL USAGES,

and the most that can be undertaken is a gradual improvement of the scenery on the old lines. Such improvements, as distinct from extreme reforms, there certainly have been. Sir Henry Irving, of the Lyceum Theatre, is a notable exponent of moderate reform. The late Sir Augustus Harris, our leading *impresario*, has also done much in the gradual beautifying of his scenes on recognised lines, though he was frequently hampered by the fact that his productions required a too realistic mounting of the ultra-sensational kind. If we wish to see a *mise-en-scène* on Art lines, the outcome of extremist experiments, we have only the private stage at Bushey, where Hubert Herkomer, who at one time took a leading part in the movement in England, has at his own expense achieved numerous successes as a stage-manager and scene-painter. His miniature stage has been a working model from which our actor-managers have learnt much. Those who have had the good fortune to see one of the Bushey performances will have realised the difference between

NONDESCRIPT MOUNTING

and really artistic scenery. The general public little knows to what an extent the efforts of Hubert Herkomer have affected stage-management. Without his private experiments it is hardly probable that even Sir Henry Irving's stage would have shown such improvements as are now accepted as a matter of course. The curious feature, however, of the movement in England is not so much the absence of extreme changes in the scenery of our stages, as the almost entire absence of the application of modern science and modern methods in the interests of the stage management. Even the few exceptions which do exist generally concern only the substitution of electricity for gas in stage lighting, or some

minor or mechanical appliances to facilitate what is termed a "quick change." We are, for once, untrue to our national reputation for practical adaptations; and this, moreover, in a case where there is unlimited scope for energetic young engineers. In this country, again, the question of fire protection has not been associated with the movement, and the

ADVANCEMENT OF STAGE HYGIENE

seems scarcely to have been considered by our exponents of "stage reform." The former omission is, of course, quite in keeping with our traditions. We insure our property, and never consider the tremendous national loss by fire, nor do we take measures for the protection of life from fire until some great catastrophe has fallen upon us. But in the matter of hygiene, such neglect is unusual in a country which prides itself on its leadership in matters connected with sanitation. I now propose to show how far modern sciences and methods have already been brought into the service of stage management, and how the protection of audiences and of employees has been attended to, as far as the arrangement of stage is concerned. I do not intend to formulate any model code of requirements, or to describe any model stage of my own. This paper will solely indicate examples of stages erected during the last twenty-five years, in which attempts have been made to fulfil modern requirements with the means at our disposal at the end of this great

CENTURY OF TECHNICAL PROGRESS.

Earlier examples of stage machinery are not dealt with, as these can easily be explained from what I shall term a typical example of the English stage of to-day. There is little difference between the ordinary London stage of 1897 and the stage of 1700. The electric light may have incidentally taken the place of the lime-light and gas of recent years, or the candles or lamps of an earlier period, and, as I have observed, there may be some "tricky" mechanical detail or slight improvement in the minor gear; but such unimportant contrivances, I am afraid, complete the list of changes made. Even where the *mise-en-scène* is improved so much as at the Lyceum Theatre,

THE ANTEDILUVIAN WOOD STAGE

still remains. London, however, is not the only city, nor England the only country, where such lack of progress is observable. Modern stages are as yet rare abroad, except in the countries where "stage reform" originated. The only difference is that, while some of the oldest and worst stages in London have been known to show excellent mounting, good scenery abroad will, as a rule, only be found on a modern stage; and I will here take the opportunity to express my admiration at the perfect scenic arrangement of some of our plays, for the production of which our managers are so greatly hampered by their pitiable stage equipment, which compels them to have recourse to innumerable makeshifts. It would, however, be impossible for the London manager to do such excellent work if he had to change his play-bill daily, as is frequently the case on the Continent. The so-called "set pieces," for instance, could not then be so extensively used as they are now. It is probable that plays with long runs, in which the stage-carpenter's work becomes mere routine, have partly been the cause of our tardy progress in "stage reform," while the more complicated requirements of a continually changing play-bill must have assisted the movement abroad. Before going further I may mention that, with a view of studying

MODERN STAGE MECHANISM,

I have personally visited most of the theatres on the Continent possessing modern stages. Every facility was granted me by the authorities in every case, so that it is not without a full knowledge of the most recent developments that I have ventured on this paper. I must, however, as an architect, claim indulgence for any errors of expression in dealing with a subject which rightly belongs to the allied profession of the engineer. But, curiously to say, no English engineer seems to have as yet given the stage and its possibilities any special

* A Paper read before the Society of Arts on Wednesday, April 20, 1898.

thought. And what is more, no English stage mechanist nor carpenter has ever given us any publication dealing with the wood stage of old that might serve as a basis for my remarks. I am, therefore, practically broaching an entirely new subject or section in that vast world commonly known as "Technical Science." It would certainly be premature to attempt any rigid form of classification in so new a subject. The exact definition of the headings seems to me practically impossible. It would, however, be well to note that stages may readily be grouped

ACCORDING TO THE MATERIALS

of which they are constructed. I will therefore use the main divisions: Wood Stages, Wood-and-Iron Stages, and Iron Stages; and I will also make further subdivisions according to the power chiefly employed in working the appliances. These subsections are: Manual Labour, Hydraulics, Electricity. Owing to the almost entire absence of steam for motive power in connection with stage machinery, a separate division for appliances where steam is employed is not required. I first take the Wood Stage, then the Wood-and-Iron Stage, and lastly, the Iron Stage. Manual Labour is employed in all three, but electricity and hydraulics are only to be found in connection with the latter. Hence, the division of the subject is practically as follows:—

Wood Stage: manual labour.

Wood-and-Iron Stage: manual labour.

Iron Stage: manual labour, hydraulic power, electrical power.

Before, however, speaking of the stage, I must particularly call attention to the purposes of the various classes of playhouses for which scenic paraphernalia have to be provided. This may at first sight appear out of place, but I hold that if the purposes of the different institutions are borne in mind, it will greatly facilitate the appreciation of the circumstances which govern the construction and working of stages, and the structural as well as the economic difficulties which have to be overcome. I must also remind you of the necessity for studying the planning of a modern playhouse, more especially in regard to the stage and auditorium, for it should be clearly remembered that stage mechanism is not everything, but that the sighting and acoustic properties have to be considered. The outlines and dimensions naturally depend in the first place on the respective requirements of the stage-management or owner; but in the same way as the lines of the auditorium are essentially governed by the proscenium opening, the setting out of the stage is regulated by the height and width of this all-important feature. Many stages have so-called

REAR OR BACK-STAGES,

the dimensions of which are, however, dictated mainly by the facilities to be afforded for obtaining certain effects. Altogether I would emphasise that the engineer who wishes to give attention to the subject of stage construction must fully comprehend the requirements and possibilities, and it is absolutely essential that he should not only know the wishes of an individual client, but also the varied policies or makeshifts necessary under different circumstances, and above all in different countries. In my work "Modern Opera Houses and Theatres," and in various papers read before the Royal Institute of British Architects, the Architectural Association and elsewhere, I have already spoken of the very different manner in which theatre construction is treated by the architects of the Continent as compared with the way in which it is dealt with in this country. I have laid some stress on what I might almost term the difference of feeling which pervaded theatre Architecture, and it would not be out of place to repeat that there exists a considerable distinction between the artist and leader of his profession who is responsible for the Continental buildings, and his more practical confrère of our own metropolis. In the same way as there is a decided contrast in the character of those responsible for the erection of theatres in this country as compared with those on the

Continent, so there is a wonderful difference in the *personnel* responsible for the construction and working of the stage. With few exceptions, the construction of our stages is in the hands of a stage carpenter, who has had no exceptional advantages in the way of technical training, and whose position in the theatre is hardly better than that of any foreman of artisans. Abroad, even for the construction of wood stages, the commissions are given to fully qualified engineers who hold influential positions in their profession. More particularly in German speaking countries, there is a distinct calling of

STAGE ENGINEERING,

and though some few of the present leaders may have risen from the ordinary stage-carpenter, this profession is practically now only composed of men whose preliminary training alone often approaches that of our Royal Engineers. The body of stage-engineers includes men with exceptional powers of initiative, and the way in which the work is usually executed also displays, I am glad to say, such full consideration for the requirements of the scenic artist as is but seldom found where the interest of Art and science clash. In several instances even, the stage engineer takes also the position of "Director of Scenery" (Artistischer Leiter), and he is held responsible for all stage effects, including the design of the scenery, which is prepared under his supervision. This last-named combination of offices in one man I certainly do not hold with, and I would add that the arrangement is but rarely successful. I prefer to see the mounting of a play in the hands of a scenic artist of recognised standing, to whom the engineer and

THE PRINCIPAL OF THE PAINTING-ROOM

should be able lieutenants, and not collaborators on an equal footing. One mind alone should govern the mounting of a play. All the larger theatres of the Continent, it is noticeable, employ permanent engineers, whose appointment is mostly in the gift of the owner, and is held continuously, irrespective of any change in management, lesseeship, or varying appointment of scenic artist. It is not my intention to indicate how much the scope of the engineer depends on the individual in charge of the stage—in other words the stage-manager, lessee, or actor-manager, as the case may be—nor do I wish to speak of the various circumstances on which depends the amount of attention the mounting of a play receives, what effects are attempted, and what methods are employed. All this would lead too far, though, to repeat, it is essential for the theatre engineer to be versed in the varied requirements that he may be called upon to consider. I cannot, however, when speaking of the modern stage, omit some mention of expert opinion on scenic Art and its auxiliaries, for nothing has so materially influenced the recent development of stage mechanism as the candid criticism of recognised authorities. In the first place let us look at the question purely

FROM THE ARTIST'S POINT OF VIEW.

The distinguished artist, Hubert Herkomer, holds "that the real secret of perfect scenic art lies in illusion," i.e., in visual deception, or in not allowing the eye of the spectator to discern the means whereby the semblance of reality is obtained. Mere actuality will not accomplish this any more than good painting *per se*. It is in the attempt to get absolutely every requisite effect by painting that so much mystery is lost on the stage, for the scenic artist's art should be as much concealed as that of the actor. It should not be too manifest whether a background is painted or modelled, any more than that an actor is "made up" or appears in his natural form. Let us remember that an actor whose wig, for instance, is so badly fitted that his own hair is visible would not be tolerated for a moment; and yet the public will accept a street scene painted on a canvas that is moved by every draught, a

ROSE BUSH CUT OUT OF THIN BOARDS,

or a moon rising very quickly straight up the sky and then remaining stationary. Do not forget that it is quite safe to let down a wobbly sheet of canvas close to the footlights,

with a scene painted thereon representing breakers dashing over the rocks, and perhaps a sinking ship in the distance, to which the actor may have to refer in his speech. It is safe to have layers of canvas hanging from the "sky" like so much washing hung on a line, and certainly but few have ever questioned the prerogative of the "firmament" to come together at right angles in the corner. Why, it would take almost a volume to describe the many anomalies of scenery constantly observed on the London stage. Again, from the stage engineer's point of view, authorities abroad have published opinions which are not so very unlike Herkomer's. They assume that the desire for realism which prevades the nineteenth century has completely changed the ends and aims of modern scenic art. The decorative artist, like the actor, must know how to be in earnest. Actor and scene-painter alike must, above all, so labour that the audience shall forget that they are within the four walls of a theatre. But our old stage methods prevent the realising of such an aim, and the impression of an audience that they are only witnessing a play is often far too palpable. Why have the horizon cut horizontally by a crease, showing where the cloth has to be canted? Why let our

BEAUTIFULLY PAINTED PANORAMIC SCENES

jerk along according to the jerky manner in which the scene-shifter handles his drums? The panoramic scenes may cost £1000, and yet the simplest mechanical contrivance to ensure their smooth working is grudged and the effect entirely spoilt. Surely this is not as it should be. Does it not seem curious that in these enlightened times the theatre should still have to develop behind the back of society, and that the memory of the former condition of things still clings to matters theatrical? Truly the actor of to-day is treated well enough by society; he is no longer a vagabond and a stroller. Nevertheless, the stage still occupies an exceptional position; it is still to a large extent ignored by the State and by Science. Let us look at the matter even from the most prosaic point of view—its commercial aspect. Science has turned industrial. She tins meat and condenses milk. But she has not troubled herself about the stage. We employ the same wasteful methods as if modern science were non-existent. Surely it is time to wake up to the necessities of modern entertainment.

A large number of drawings, photographs, and sketches of stages were shown at the close, as lime-light views, and these were explained and criticised by Mr. Sachs. Reference was also made to a collection of drawings exhibited in the Lecture Room.

A LARGE window, costing upwards of £300, is about to be placed in the west front of the Church of St. Ignatius the Martyr, Sunderland.

THE '91 Art Club will hold their annual exhibition of members' works at the Modern Gallery, 175, Bond Street, from May 4th to May 8th inclusive.

THE Hammersmith Vestry has selected "Jarrahdale" Jarrah as the material for paving the Goldhawk Road. Blocks to the extent of 650,000 have been ordered.

A NUMBER of repairs are being carried out on St. Michael's Church, Linlithgow, in connection with the scheme of restoration. The west window is at present being restored, and when completed a stained glass memorial, by Messrs. Ballantyne, Edinburgh, will be erected.

THE gift of a new altar table has been made to the parish church of St. Cuthbert, Lytham. The altar is of oak, carved in Gothic panels in keeping with the design of the reredos, and is the work of Messrs. Jones and Willis, of Birmingham.

At the All Saints Vestry, Evesham, considerable discussion took place as to the proposed restoration of Abbot Reginald's gateway, leading into the churchyard. This is the oldest specimen of Norman Architecture connected with the abbey, and for a long time has been crumbling away. It was stated that large stones had been carried away, and people attributed it to the Americans.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
April 27th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE Government has decided, as regards the new War Office and public buildings, to place the planning in the hands of Sir John Taylor, who will consult the heads of departments as to their requirements. The Architecture of the structures which will clothe these shells will be under the direction of Mr. George Aitchison, R.A., as president of the Institute of British Architects. It could hardly be in better hands; for no one has a higher conception of the duty which lies at the door of every Government to adorn, and not disfigure, the greatest city in the world. The public may rest assured that those he recommends to prepare designs will be those who are thoroughly qualified to attain this object.

A SERIOUS piece of vandalism has been suggested in the form of a scheme for widening Waterloo Bridge. The proposal is to add to the width by equipping the viaduct on each side with a new footpath, supported by buttresses to spring from the existing piers. In this way the whole width of the structure as it now is would be converted into a roadway for vehicular traffic, and at the same time the appearance of one of the most perfectly proportioned bridges in Europe would be hopelessly ruined. The scheme, however, is not likely to be adopted. It is a curious fact that until recent years the construction of bridges in London, with the exception of those in the City, was a matter of private enterprise. Most of the great bridges over the Thames were not acquired by the public authorities and freed from toll till 1879. Waterloo, which was erected between 1814 and 1817, cost a million sterling to build, while Vauxhall, the first iron viaduct by which the river was ever bridged, cost, at about the same period, just a little over a quarter of that sum. This old iron structure, which has neither beauty, nor convenience to commend it, is now about to be demolished, and in course of time its place will be taken by a successor in the style of the bridge at Westminster.

It is to be hoped that there is no truth in the rumour which credits the Government with the intention of locating science museums and laboratories on part of the site reserved for the South Kensington Museum. The space on the east side of Exhibition Road is barely sufficient for the erection of the galleries needed for the proper accommodation of the Art collections, and to devote any part of the site to buildings for the use of the science section would be to prepare at no very distant date for a worse condition of congestion than that which is at the present time afflicting the

half-developed museum. The want of a really adequate building, large enough to show to reasonable advantage the many fine things that are already the property of the nation, is acute enough, but what is even more necessary is a sufficient provision for future expansion, so that there may be no possibility of any revival of the old argument that the operations of the Museum must not be extended because there is no room in it to show the things it actually contains. The expenditure contemplated now must be something more than an atonement for years of parsimony; it must be an insurance against future abuses.

WHAT makes more ridiculous the suggestion that art and science are to be crowded together on this one small site is the fact that there is already in the possession of the Government a piece of land amply large for all the science buildings that are likely to be wanted for many years to come. Not so long ago the vacant space on the west side of Exhibition Road, and opposite the Imperial Institute, was bought for £75,000, so that a separate science museum might be erected; and there is no intelligible reason why this particular site should not be utilised and the original idea of housing the art and science sections in different buildings should not still be carried out. Nothing would be gained by crowding them together under one roof; and if this crowding should result, as it seems inevitably bound to do, in an impairment of efficiency all round, half the value of the present scheme of extension, and half the use of the liberal expenditure proposed, would be destroyed. If the Government scheme for the laying out of the £800,000 voted is found, when it is laid before Parliament, to be so wanting in judgment, very strenuous efforts will have to be made to secure its thorough revision.

THE Corporation of Plymouth, desiring to commemorate Her Majesty's Jubilee, determined to build an Art Gallery and Museum, and applied to the Local Government Board to sanction a loan of £22,000 for that purpose. Accordingly, a Royal Engineer—Major-General Crozier—has been sent down to judge as to whether such a building is needed. The General, the town clerk, and the architect of the museum seem between them to have engaged in a somewhat heated discussion. The General complained that no plans and estimates had been sent up; the town clerk said he had followed the invariable practice; the architect stated he had acted in several similar cases when a loan had been applied for and granted, and had never been asked for quantities before; and the General closed the inquiry by the dignified expression of opinion that he supposed that architects considered themselves artists, and therefore as not being bound by the ordinary rules of business. The architect refrained from the obvious retort that the Royal Engineers, who appear to have a monopoly of this sort of inquiries, were hardly a body from whom to gather an expert opinion as to the needs of a town like Plymouth to have an Art Gallery.

AFTER being closed for about six weeks for repairs, the Church of St. Mary-the-Virgin, Aldermanbury, has been reopened. The nave ceiling is of the barrel-vault type, and has been tinted a delicate ivory, relieved with bands of light sage green and terra-cotta, the main ribs being light terra-cotta with cream-coloured enrichments, and the modelled plaster work light green and fawn colour. The main cornice has been treated in light shades of terra-cotta, ivory, and cinnamon, with the enriched work gilded. The aisle ceilings are in harmony with that of the nave. The general tone of colour on the walls is a medium Pompeian red, the upper part relieved with panelled ornamentation and bands of lighter colour and stencilled decoration between the windows. The arches of the windows have been formed into panels in two tints of red. The east end wall looks very effective in a light peacock green ground with stencilled diaper ornament in cream colour and light green, and emblems on either side of the large east window in

painted panels of an architectural character, with bands of ornament on a gold ground above and below. The lower part of the reredos has been decorated with diaper ornament in light green, terra-cotta, and gold on a cream ground, with tapestry hangings on either side. The general aim has been to keep all the decorations in harmony with, and subordinate to, the architectural features of the buildings, which date from the year 1675, having been erected by Sir Christopher Wren after the great fire. Three pairs of old oak doors, the only remaining vestiges of the original woodwork, have been once more restored to the light of day, the paint with which they had been thickly covered having been removed from them and the original surface laid bare. An interesting discovery was made with regard to the front oak doors. They had been concealed under a deal painted casing, and on the removal of this a large number of lead bullets were found embedded in the oak, no doubt the result of some riot of former times. The works have been executed from the designs and under the supervision of Mr. Eric Collins, of 31, Great St. Helen's, and the contractors were Messrs. Campbell, Smith, and Co., 75, Newman Street, Oxford Street, W.

IN the destruction last week of the Metropolitan Tabernacle by fire, a well-known building has vanished. In less than one hour the edifice, 146ft. long by 81ft. broad, 62ft. high, and with accommodation for 6000 persons, was completely ruined, the damage being estimated at £35,000. Various theories are discussed as to the cause of the outbreak, but an overheated flue is the explanation which finds the most general acceptance. The extraordinary capacity of the building was due to the fact that the two galleries completely encircled it. The form was elliptical, the roof internally was slightly domed, and, as Londoners know well, the portico was, and is yet, for though seriously damaged it has not fallen, supported by handsome columns. Mr. Spurgeon objected to pulpits, consequently there was none in the Tabernacle. Instead there were two platforms, one rising out of the other.

FIRES in places of worship are fortunately rare in this country, but this Metropolitan Tabernacle calamity suggests the inquiry whether due attention is always paid to the safety of congregations. Elaborate precautions against fire are now enforced, especially in London, upon the architects and builders of places of amusement, as well as upon their responsible managers; but danger exists wherever large masses of people are assembled, and a panic is as likely to be disastrous in a church as in a theatre. We do not know what provision existed in the Metropolitan Tabernacle for the quick egress of the congregation in case of an alarm, but it is notorious that there are very many churches from which it would be difficult to escape within a few minutes. It is much to be wished that this calamity, by which, happily, no single life was lost, may draw attention to the necessity of taking needful measures wherever they are required.

A WONDERFUL mansion has just been completed in New York for one of the great millionaires there, Mr. E. T. Gerry. It is at the corner of Fifth Avenue and Sixty-Fourth Street, a situation almost the ne plus ultra of desirability. It is entered by a magnificent porte cochère of wrought iron and plate glass; within is a superb double staircase composed of red porphyry, each step, it is said, costing £500; while knights in armour rather incongruously hold branches of electric light. The rooms are all in accord with this grand staircase, with its black and gold balustrade. One drawing-room is octagon and domed, the decorations being in the Watteau style, by Paris artists; other drawing rooms, galleries, and libraries are in different French periods, with a strong inclination to the Renaissance, dear always to the hearts of the nouveaux riches. The mansion is said to have cost £250,000.

VIEW OF STAIRCASE AND ENTRANCE TO LIRRARY, WELBECK ABBEY. H. WILSON, ARCHITECT.

BRITHDIR CHURCH, N. WALES. H. WILSON, ARCHITECT.

HAPPILY it is rarely that a serious catastrophe at a building in course of erection has to be recorded, but one happened in London last week that will excite no small amount of attention amongst architects and contractors. The scene was a block of mansions being erected at the back of Albany Mansions, Victoria Street. The new buildings face on Orchard Street, and consist of a red brick and stone structure, seven stories in height. They were nearly completed, as the roof was on and most of the floors had been laid. At the time of the disaster, on Thursday last, some thirty workmen were engaged in the interior, preparing for the carpenters, fitters, and painters. At five and twenty minutes to four a loud, rumbling noise was heard, which lasted for about half a minute, and the whole building was enveloped in a cloud of dust. When it cleared away men were seen crawling through the windows and hanging on to the window-sills, and it was discovered that the roof had fallen through and carried with it each successive floor. A huge mass of debris, consisting of iron girders, scaffolding, plaster, and brickwork, lay piled up from the basement to the level of the second floor windows. About a dozen men who had been working on the ground floor had time to rush out of the building before the falling mass reached them, but most of those on the upper floors were crushed beneath the ruins. Seven men were killed and several injured. Viewed from the outside, the building presented an extraordinary appearance. Besides a huge fissure in the stuccoed coping near the roof, there were various cracks from the top of the building to the ground. In an interview the architect of the building stated that the accident was caused by the collapse of the concrete roof. The men were putting the finishing touches to it, and were knocking away the wooden supports when the structure collapsed, killing the men actually underneath and bringing the other floors in succession to the basement. It is stated that these men acted contrary to orders, and before the concrete had properly set.

SOME idea of what the new premises of the Birkbeck Bank will be like is now possible on account of the removal of the hoarding from the completed portion in Southampton Buildings, Holborn. The magnitude of the building, however, is not yet wholly revealed. An extensive frontage in Holborn, stretching from Staple Inn Buildings, by Holborn Bars, to the premises of the London and County Banking Company, has yet to be erected. This will be commenced forthwith. The new building has been in course of erection for six years, and may be described as a vast experiment in glazed terra-cotta and glazed tile work. The huge block that is completed consists on the west side of four lofty stories of glazed work, with part of the flat portion of a very pale stone tint, the other being of a darker ochreous hue. From the top of the second story spring rows of pairs of columns of a subdued green, and beneath these is a series of boldly executed medallions of men eminent in Art, science, invention, commerce, and banking. Some blanks between are left for the introduction of the electric light. The south-west corner has been carried up higher by the addition of a tower with green fluted columns. On this is the date when the Bank was founded, 1851. Beneath are emblematical figures of Europe and Australia, and lower down a figure of Commerce flanks one of Britannia. Round the corner towards the old premises is modestly placed a medallion of Dr. Birkbeck. The new premises will be extended in this direction, and will cover the site of the old ones, and the completed portion of them, devoted to bank purposes, will, it is said, be opened for business early in August.

FOR spaciousness this bank interior will be unique. A large vestibule leads to a lofty and much larger hall, where a lift, fitted with mirrors, and an iron-wrought staircase, leads to a vast gallery running round the base of the enormous high-pitched dome of the public banking chamber further on. By these means the upper offices and rooms of the bank are

approached. The great banking chamber is circular. Its internal walls are covered with glazed tiles, generally of a pale buff or yellowish colour, relieved with other tints. The extreme top of the internal dome is lined with rich gold mosaic; then come large sections of glazed tiles in relief, pierced with oval openings for light; then, lower down, all round, are elaborate paintings; and, beneath these, wide and elegant doorways. The gallery itself is supported on great brackets masked with enamelled pottery representing heraldic animals. The pictures illustrate such subjects as electricity, plate-printing, steel-forging, the memorable run on the Birkbeck Bank in 1892, the miser, shipping, agriculture, a building society, and so on. To a figure of Apollo also great prominence is given. Downstairs is the massive bullion room, said to be dynamite proof, and the deed room, which can be completely isolated by water. The architect is Mr. Vernon Knightley.

It is said that the number of pictures sent to the Academy this year approached fourteen thousand. As only about one in fifteen could be hung in the galleries, the process of sifting out the very little wheat which was hidden in so large a mass of chaff must have been unusually exacting and laborious. In the face of such a stupendous task, the Academy authorities might well set themselves to consider whether no device can be invented to check the anxiety of the irresponsible blunderer in Art to force his ridiculous productions upon the attention of the Council. In all probability a definite reduction in the number of things which any artist may submit would have the effect of appreciably raising the average of merit in the whole mass of work sent in, and it would certainly diminish the labour of selecting what deserves acceptance.

FOR it must be remembered that the people who offend most are just those who have not the remotest chance of seeing their efforts placed in the Exhibition. With the exception of the portrait painters, there are few artists of skill or repute who send more than three or four works annually to the Academy. A sincere worker knows that it is impossible to produce as many as eight things of really high quality within the short space of twelve months, and so, instead of spreading his energies over more than he can accomplish, he concentrates himself on just enough to bring out his fullest capacity without wasting his power. But the amateurs and raw beginners, who have no standards, and understand nothing about artistic obligations, multiply their absurdities, and insist upon wearying with them the long-suffering Academy authorities. If the number of things which it is possible to submit were reduced by half, there would be no appreciable diminution in the amount of good work sent in, but half the rubbish would disappear.

AS the business proportions of New York become more and more congested, additions are made to the immensely tall buildings for which the city is becoming famous. Each year architects are becoming more daring. The year 1897 saw the completion and occupation of a building of twenty-six stories. It stands on one of the most valuable sites in the city, on Broadway, between Wall Street and the Post Office. New Yorkers know it as the St. Paul Building. Its roof is 308ft. above the roadway. When this building was planned it was popularly thought that the climax of high building had at last been reached. The year 1898, however, will see the completion of a still taller structure—a building of twenty-nine stories, the towers of which are to be 382ft. above the street level. Until about 1880 New York buildings were no higher than those of London. The number having more than five stories was at that time less than a dozen. But since 1880 these great buildings have been rising on all sides. For about ten years the limit seemed to be fifteen stories, but in the early nineties twenty-story buildings began to tower up, and in the last few years buildings have mounted higher and higher, until one syndicate of capitalists, more

daring than any of its competitors, has constructed the building of twenty-nine stories; and as architects and builders declare that they are not yet at the end of their resources, the present year may probably see the planning of a structure of thirty stories or over. Architects are willing to plan for even forty-story buildings, if capitalists will come forward to finance them. Before the bricklayers or the masons begin work, the buildings look like enormous cages. The brickwork bears none of the weight. It is used only as a casing to keep out the weather. During business hours people equal in number to the population of a good-size town are housed in many of these New York buildings; and the crowds about the elevators at some hours of the day are as great as those at some of the busiest of the underground railway stations in the City of London.

AN interesting discovery of frescoes has just been made in the Senatorial Palace at the Capitol. For several days workmen had been employed to remove a wall which showed signs of weakness, and in the course of demolition a number of mediæval frescoes were discovered, one of which represents the Annunciation. The colours are extremely vivid and well preserved. When the operations have been completed it is hoped that further discoveries will be made which will enable archaeologists to form an accurate idea of the internal and external decoration of the Senate in the Middle Ages.

AFTER a period of disarrangement extending over several years the famous Gobelin tapestries of Haddon Hall are complete again. Some time ago it was discovered that the "Æsop's Fables" panels in the state bedroom—these panels formerly belonged to Charles I., but his crest has been removed now—were sadly in need of preservation. The Duchess of Rutland placed the delicate work of restoration in the hands of a London lady who has made tapestry her study. The tapestries now look quite fresh and clean, all the decayed stitches have been replaced, and a new lining added to each panel. The tapestry at Haddon is especially cared for by the Duchess of Rutland, and, thanks to her Grace's attention, the whole of it is now in excellent repair. Much of it is of unique value because of its curious style of manufacture—it appears to have been woven in small pieces, which were afterwards sewn together. The fine bas-relief overmantel, representing Orpheus charming the animal world, in the royal bedchamber, has been "freshened" with a coat of stone colouring, and the ceiling and picture frames are aggressively assertive of their recent contact with the whitewasher's and painter's brushes—aids to the comforts of modern domesticity which are incongruous within the ivy-clad walls of Dorothy Vernon's romantic bower.

A NEW source of infectious dangers discussed at the last meeting of the Paris Academy of Medicine, will tend to the abolition of wood in floor construction. Two learned professors attributed the spread of the commonest infectious disorders, particularly diptheria, pneumonia, and consumption, to the dust on the floor. Apparently the only way of absolutely avoiding this danger is to exclude wood altogether from the substance of floors, or to cover the wood with a coating of asphalt. Meanwhile the French military authorities are beginning to employ tar as a coating for barrack floors, and thereby earning the approval of the Academy of Medicine.

THE present exhibition of the New English Art Club is one of unusual interest. In it the Society seems to justify itself upon the lines on which we fancy it to have been originated—those, that is, of a certain return to first principles in Art, and a recognition of the fact that the Art of painting is mainly comprised in two things: that the painter should see, vividly, acutely, and individually, and that he should master, for the expression of his vision and not according to the formulae of academic persons, the extremely difficult, flexible, and expressive Art of painting.

(Continued from page xlii.)

THE method of finding the position of the centre of a swing door is illustrated in Fig. 108. Draw the plan of the door closed, also the post, then draw the plan of the door in the position it will occupy when opened to its fullest extent. In the diagram this is shown at an angle of 90deg. Allow a little clearance from the post to avoid marking the polish when opening, and draw diagonals on the rectangular figure produced. The point of their intersection will be the centre required, marked P in the figure, with P A as radius, and P as centre;

FIG. 108. METHOD OF FINDING "CENTRE" OF SWING DOOR.

describe the arc $a b$; this will be the edge of door. Step the compasses $\frac{1}{2}$ in. nearer the post, and set to point, a as radius; describe a second arc, the outline of the post. This will provide the necessary clearance to prevent the door squeaking when opened. The front edge will be described from the centre P, with the width of door as a radius, the striking post to be left square inside. The glass panel is secured by means of $\frac{3}{8}$ in. beads, fixed with brass cups and screws, and bedded in wash leather. It should not rest upon the middle rail throughout its whole width, but only for an inch or so at the hanging stile, and at the top front corner; by this means its weight will not tend to rack the door.

The bollection mouldings in the lower panel are screwed at the mitres, and secured to their bed by screws inserted from the back of panel under the beads, which are afterwards planted in. No glue should be used under the mouldings, and the screw holes should be slotted to allow the latter to shrink. Bollection mouldings should not be rebated over the framing more than $\frac{1}{4}$ in. in consequence of the difficulty of keeping the marginal part down without the aid of glue, which, in such cases, is opposed to sound construction, as, there being considerable substance in the moulding, it will expand and contract with the weather, as will also the framing, and if fixed at the edges either the thinnest member of the moulding will split off, or the mitres will be opened. A Gothic door with four centred head is shown in Fig. 110. These doors, not now so much used as formerly, are suitable for churches and public buildings. It will be observed that the mouldings are stuck in the solid, and stopped

at the sight lines of the intersecting rails, &c. Abject copyists of mediæval work stop their mouldings everywhere, irrespective of the necessity, but the intelligent designer, comprehending the reasons of the early workman for so doing, will, now that the same conditions no longer exist, vary his treatment accordingly. In the middle ages the method of scribing was unknown, and the ruder tools of the workman prevented the successful use of the compound mitre, and his ignorance of methods of seasoning and preserving wood from the action of the air, justified him in laboriously and clumsily stopping all his mouldings at the shoulders; but to do so now, when all those hindrances to good work are removed, is an absurdity. Confine the square stop to those places where shrinkage of the parts would disarrange the joint, as at the top edges of rails and on the stiles between the rails, but where this would not occur, as at the top ends of muntings, use the scribe joint, which is both more slightly and effectual. The upper edges of the rails are chamfered to prevent the accumulation of dust. The joint at the crown of the door is usually made with a hammer-head key, as shown in the enlarged detail (Fig. 112), and also cross-tongued. At the haunch joints a handrail screw is sometimes used, as the key is considered unsightly, but the latter makes the more homogenous joint. The shoulders at the foot of the munting should always be square, not bird's-mouthed over the chamfers, as any shrinkage of the rail will spoil the joint, and there is also considerable danger of splitting the munting when champing up.

Fig. 113 is a part elevation of a pair of sliding fire-resisting doors, made by the writer for one of the national museums, and although it has never been put to the test, it will probably, if occasion arises, prove more worthy of its name than many of the so-called iron fireproof constructions. Each door consists

essentially of two stout skins of English oak, $1\frac{1}{2}$ in. finished, enclosing a well-rammed body of slag wool, an inch in thickness; this is interlaced with steel wire, so that in the event of one skin getting burnt through, the wool will remain in position to protect the other. The stiles and outer rails are of solid oak, $3\frac{1}{2}$ in. thick, the meeting stiles rebated $\frac{3}{4}$ in. The doors run on wheels let in the solid rail at bottom in a channel sunk in the floor, lined with iron, the channel being filled up close to the door with concreted slag wool to prevent flames

FIG. 112. A HAMMER-HEAD KEY JOINT.

creeping under. The top wheels run on an iron angle bar cemented into the stone wall, another flat iron bar is inserted in the arch over the opening, and projects $\frac{1}{2}$ in. from the face of the wall. A groove to receive it is worked across the doors, similar iron bars, sliding laterally about $\frac{1}{2}$ in. on studs fixed on the back edges of the stiles, fit into corresponding grooves in the wall, and effectually shut off communication between the rooms.

FIG. 109. SKETCH OF SHOULDER TONGUES.

Artesian Bored Tube Wells.*

BY MAURICE OCKENDEN, JUN.

FROM the earliest records, we find the obtaining of water from wells seems to have been known. The earliest form of wells were probably rude excavations in the sides of hills, where the water rose to within easy reach of the surface; but the opinion of some is that the actual well sinking took place soon after the discovery of metals. However, we can see at the present time in the East many ancient wells which have passed through both rock and quicksand. Mr. Ewbank (as mentioned in Hughes' book on Water Works) asserts: "that to the constructors of ancient wells in the East, we are indebted for the 'only' mode known at the

from travellers' accounts we learn the practice of ancient inhabitants was to dig square wells 180ft. to 240ft. in depth through the vegetable soil, clay and marl, until the limestone rocks were reached, and then boring 4in. to 8in. in diameter were carried down. The probable reason why these wells were made square is the convenience of strutting. A French missionary, Abbe Imbert, has given an account of the wells that are sunk in China, and in Dougousee's "Guide du Sondeur," states: "There exist in the province of Ou-Tong-Kiao many thousand wells in a space of 30 miles long by fifty broad." These wells, by the description, were apparently bored by a similar process as that known as the Mouton system, which has been used so much in France. As may be imagined with the crude geological knowledge at their disposal, these wells often proved unsuccessful; sometimes natural gas

however, many wells were bored, principally in the Wolds near South, and in the Thames basin, near Tottenham. The artesian well at Grenelle, near Paris, was really the first to draw the attention of the public to the system of bored wells as now used, not only on account of the success of such boring, but also the discussion and investigations to which it gave rise. The title of "Artesian" should only be applied to borings where (as in Artois) the water overflows at the surface. The bored or drilled well is not only used for water supply purposes, but is an effectual and economical means for ascertaining the possible strata in connection with deep foundations—such as railway work; also for prospecting for minerals, as well as in sinking pioneer holes to ascertain the quality and quantity of certain water supplies prior to carrying out extensive works. Because water has been found in one instance where a natural supply was not expected, it is not a guarantee that a similar supply of water, and at the same depth, will be found in the neighbourhood, as it requires often a careful investigation before expensive borings are commenced. There are many architects who look upon

A PIONEER BORING

as waste of money. So it is, where sufficient data is obtainable without; but there are many districts in this country where water varies in depth and in yield. In such cases it is necessary to gauge the well during the summer and autumn, and also to test the yield by pumping. This will give the architect or engineer and the contractor something definite to work upon for the well, for the permanent supply. Before referring to the systems in boring and drilling, the driven tube well, or, as it is popularly called, the Abyssinian Tube Well, may be mentioned as being a useful means of obtaining water from shallow depths, this being the mode adopted during the Abyssinian Expedition of 1868. This process was invented by an American named Newton, and patented by Norton, in London, 1868. The bottom tube is fitted with a steel point, with perforations about 3ft. up from the point, and driven by means of a monkey, lengths of tubes being added as the work proceeds. If driven wells are preferred, it is considered desirable to insert a moveable point, so that with a special tool it can be pushed on one side when the stratum becomes too stiff to allow the tube to be driven safely, and then boring tools are inserted to take out the debris in the ordinary way. Driven wells are not always desirable, as the tubes are liable to split under the percussion, which would make the supply open to contamination with any possible soakage around the tube near the surface, and so defeat the object of a tube well. Where water is found at shallow depths (in soft sandstones, &c.), it is often found a cheaper means to drive a few wells somewhat close together, and connect all into one suction, rather than go to the expense of boring a deep hole where the geological conditions are uncertain. This system is not often adopted, as the quality of the supply, coming from so shallow a depth, cannot be depended upon if surrounded by buildings, &c. It is usually impracticable to drive a larger tube than 2in., which means that if water fails to rise to within 25ft. from the surface an ordinary pump is useless. The means adopted for boring or drilling wells are many, but if the following systems be taken they will embrace the most important:

1. English, hand and steam boring with rods.
2. Danish, or Fauvelle system (hydraulic).
3. Canadian, or American rope system.
4. Diamond boring.

The English hand-boring has been the sole method in use in this country till quite recently, and still very largely used. An engine resembling a hand-pile driver is very much used, and is sometimes made with four iron pipe legs, braced together to form a derrick as shown for borings say to 300ft. For large diameter borings, and for great depths, it is usual to build a scaffolding or provide a strong derrick with steam power for working the winch to facilitate the connecting of both bars

A GOTHIC DOOR.

FIG. 111.
SECTION ON C—D.

present time adopted for sinking wells through quicksands, by the employment of a curb, which settles and sinks down as the excavation proceeds."

BORING FOR WATER

is also of very ancient origin, and it has been reported that in Egypt there exists borings which date back some 4000 years, and these supply water to fountains even to the present time. The oasis of the Libyan Chain are sites of these borings. In opening some of these ancient wells or borings it was found they were lined with brick or wood, but the actual method used in lining is not known. The oasis of Thebes contains flowing wells, and

was obtained, which gave them the appellation "fire wells." Three years was the usual period taken for sinking. In Europe the simple means of sinking shafts to reach a supply of water seems to have prevailed. The modern means of boring for water originated in the province of Artois, France, and

THE MOST ANCIENT WELL

constructed with the boring tool is at Silliers, in the Artois, dated 1126. In England the first record of boring is to be found in "Parentalia," or "Memoirs of the Wren Family," where it states Sir Christopher Wren adopted this precaution to ascertain the solidity of the foundation of St. Paul's Cathedral, where the original surface of the ground had been disturbed. Towards the end of last century,

* A paper read before the Civil and Mechanical Engineers' Society.

and pipes. The boring tools generally used in this system are plain chisel, tee chisels, twist bit, and open and close auger. These are all fitted with male ends and screwed parallel into the sockets of solid boring bars, which are usually made square, the top bar being fitted with swivel attached to a rope and connected over derrick on to winch, where, either by steam or manual power, the tools are surged or brought to surface. To bore by this hand-system takes a much longer time, although it is more economical than the other schemes for small bore-holes, say 3 in. to 6 in. in diameter, and to 400 ft. in depth provided the strata is favourable. To bore through rock is very tedious and slow by this system. The debris is brought to the surface with the auger, but not in a solid core, as the strata is pulverised by the chisels. The Danish or Fauvelle system is that which is being used very successfully for penetrating clays, soft rocks, and clays, although some may raise an objection to the

absence of a nice core being produced, which renders it less valuable for prospecting. Although this system is called Danish, it really is American, as it is used more there than in Europe, and has many improvements added to the original idea, both in Canada and in the United States. The Americans having such a demand for economical and speedy apparatus to obtain oil and natural gas from deep borings, have been the means of bringing out many improvements in well-drilling machinery, which greatly facilitates labour. In boring through sandstones, or even running sand, this wash-out, or hydraulic system, is particularly efficient. In Alabama, for instance, through the introduction of a relative, we carried down several borings with this system, and found it to be even better than the Canadian or American Rope Rig, which was in use close by.

(To be continued.)

Surveying and Sanitary Notes.

THE Liverpool City Council has applied to the Local Government Board for sanction to borrow £38,000 for the purchase of a site at Fazakerley for an infectious diseases hospital.

A LOCAL GOVERNMENT BOARD inquiry has been held at the Town Hall, Bexhill, into the application of the District Council to borrow £4500 for the purpose of drainage at Little Common.

A LOCAL GOVERNMENT BOARD inquiry has been held at Aberdare, respecting an application by the Urban District Council for sanction to borrow £15,000 for works and water supply under the Aberdare Local Board Waterworks Act, 1894.

MEMORIALS to two celebrated sanitarians, Sir Edwin Chadwick and Sir Benjamin Ward Richardson, are being promoted by the Sanitary Inspectors' Association. The object is to provide funds sufficient to give annual premiums, in money, books, medals, &c., to students in sanitary science at technical colleges.

AN inquiry has been held relative to the application of the Newmarket Urban District Council for power to borrow £45,000 for new sewerage works.—Mr. Frederick Beesley, M.Inst.C.E., of the firm of F. Beesley and Son, said that the new scheme would carry the sewage of the district by gravitation through Exning to the extreme north of the district. They proposed to deal with it at the outfall by the bacterial system. They would have six tanks, each 50 ft. by 37 ft. 6 in., for day use, and one tank 104 ft. by 75 ft. for night use. The objection raised by the Burwell Fen Drain Commission to the discharge of the effluent into the Burwell Fen might be met by discharging the whole effluent into the New River. The quantity of effluent water discharged into Burwell Fen would be imperceptible, and would be rendered practically innocuous.

AN inquiry has been held in the Town Hall, Dewsbury, by inspectors from the Local Government Board, into an application by the joint hospital board, composed of representatives of the Corporation of Dewsbury and the Urban District Councils of Heckmondwike, Ravensthorpe, Soothill Upper, and Soothill Nether, for power to borrow £22,000 to enable the board to erect a hospital for infectious diseases on a site in Soothill Nether, known as Chickenley Wood, and which adjoins the sewage farm of the Dewsbury Corporation.—The Town Clerk explained that in November, 1896, the board invited competitive designs from architects for hospital buildings, and in the following month they accepted those of Messrs. Holtom and Fox, of Dewsbury. In the opinion of the board, the site was in many respects admirable.

FIG. 114. A SLIDING FIRE-RESISTING DOOR.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
April 30	Charleville, co. Cork—Erection of Church	Rev. P. J. O'Callaghan, P.P.	M. A. Hennessy, 74, South Mall, Cork.
" 30	Consett, Durham—Erection of Shop, &c.	J. Cockburn	W. S. Shell, Architect, Taylor-street, Consett.
" 30	Falmouth—Erection of Pair Villas	G. Thomas	W. Smith, 38, Lemon-street, Truro.
" 30	Knaresborough—Erection of Houses	Mrs. J. Walker	J. G. Brown, Architect, Knaresborough.
" 30	Newmarket-on-Fergus, Ireland—Church Roofs, &c.		R. Fogarty, Architect, Henry-street, Limerick.
" 30	Sheffield—Erection of Twenty Almshouses	Trustees	W. R. Bryden, 1, George-street, Buxton.
" 30	Sheffield—Erection of Store	United Gaslight Company	F. W. Stevenson, Offices, Commercial-street, Sheffield.
" 30	Sheffield—Addition, &c., to Meter Shops	United Gaslight Company	F. W. Stevenson, Offices, Commercial-street, Sheffield.
" 30	Whitchurch, Glam.—School	School Board	R. and S. Williams, Architect, Wharton-street, Cardiff.
May 1	Lowestoft—Erection of House		Nelson Chambers, London-road, Lowestoft.
" 1	Alton—Erection of Brick Tank	Gas and Coke Company	F. Barnley, Manager of Gas and Coke Company, Alton.
" 2	Wednesfield—School Building	School Board	F. Hunter, Lines Lich Gates, Queen-sq., Wolverhampton.
" 2	Huddersfield—Erection of Four Houses	Industrial Society	J. Berry, 9, Queen-street, Huddersfield.
" 2	Southowram, Halifax—Erection of Four Houses		Jackson and Fox, 22, George-street, Halifax.
" 2	Turriff, Scotland—Additions to Schools	School Board	J. Duncan and Son, Architects, Turriff.
" 2	Darlington—Stables, &c.	Corporation	Borough Surveyor, Town Hall, Darlington.
" 3	North Molton, Devon—Erection of Chapel, &c.		G. Bawden, Molland, North Molton.
" 3	Waltham Abbey, Essex—Erection of Ten Cottages	Urban District Council	C. W. Wiggs, Council's Surveyor, Waltham Abbey.
" 4	Bridgend—Isolation Hospital	Parc Gwyllt Asylum	Giles, Gough, & Trollope, 23, Craven-st., Charing Cross, S. W.
" 5	Farnham—Erection of Four Cottage Residences	Mrs. Kelly	J. A. Eggar, 11, West-street, Farnham.
" 5	Glasgow—Erection of Fire Station	Corporation	Office of Public Works, 64, Cochrane-street, Glasgow.

COMPLETE LIST OF CONTRACTS OPEN—continued.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—Continued.			
May 5	Gobowen, near Oswestry—Erection of Parsonage	School Board	Shayler and Madox-Jones, 19, Church-street, Oswestry.
" 5	Tudhoe, Durham—Additions to School	Urban District Council	S. Adams, 56, North Bondgate, Bishop Auckland.
" 6	Gorton, Lancs.—Erection of Chapels, &c., at Cemetery	Urban District Council	Town Hall, Gorton, Lancashire.
" 7	Halifax—Erection of Warehouse	Miss A. Mullen	C. F. L. Horsfall and Son, Lord-street-chambers, Halifax.
" 7	Londonderry—Erection of Hotel	Commissioners of H.M. Works	E. J. Toye, Architect, Strand, Derry.
" 10	Croydon—Inland Revenue Office	London and South-Western Railway Co.	12, Whitehall-place, Westminster, S.W.
" 10	Southampton—Offices, &c., at Docks	Corporation	J. Dixon, Docks Department, Southampton.
" 11	St. Helens.—Engine House, &c.	Electric Traction Company Limited	J. J. Lackland, Town Hall, St. Helens.
" 12	Brierley Hill—Erection of Power Station, &c.	Union Guardians	T. Robinson, Architect, Victoria-chambers, Stourbridge.
" 12	Warwick—Erection of Laundry	County Schools	F. P. Trepass, 8, Jury-street, Warwick.
" 12	Llangefni—Erection of Schools	Corporation	Head Master, Nant Villa, Llangefni.
" 13	Southampton—Offices, &c., at Police Station	Corporation	Borough Engineer, Municipal Offices, Southampton.
" 16	Southampton—Erection of Lodging-house	Corporation	Borough Engineer, Municipal Offices, Southampton.
Aug. 31	Guyaquil—Construction of Custom House	Ecuadorian Government	Commercial Department, Foreign Office, S.W.
Oct. 21	Belem, Para, Brazil—Cattle Pens, Abbatoir, &c.		Brazilian Legation, London.
No date.	Abergavenny—Erection of Eight Cottages		E. A. Johnson, Architect, Abergavenny.
"	Belfast—Four Villas and Fourteen Houses		W. J. Moore, Architect, Whitehall-bldgs., Ann-st., Belfast.
"	Bramley, Leeds—Erection of Eight Houses		F. W. Rhodes, Architect, Upper Wortley.
"	Corbridge-on-Tyne—Additions to Howden Dene	J. H. Straker	J. Oswald, 33, Mosley-street, Newcastle.
"	Derby—Erection of Premises	Midland Drapery Co.	Coulthurst and Booty, 4, Albert-street, Derby.
"	Dunkeld, Scotland—Erection of Mansion House	Duke of Atholl	J. M. Henry, 7, South Charlotte-street, Edinburgh.
"	Haverthwaite—Erection of Parish Hall		Settle and Farmer, Architects, Ulverston.
"	Heywood, Lancs.—Erection of Brewery Tower		C. H. Openshaw, Architect, Derby-chambers, Fleet-st., Bury.
"	London, S.E.—Erection of Five Houses	Mansions Estate Co.	Gilmville, 15, Percy-street, Bedford-square, W.C.
"	London, W.—Erection of Block of Flats	School Board	Metcalf and Greig, 11, Sergeants'-in-a, Temple, E.C.
"	Stevington, Bedfordshire—Erection of Schoolroom		Usher and Anthony, 9, St. Paul's-square, Bedford.
"	Sherburn—Erection of Five Houses		P. Robinson, 72, Albion-street, Leeds.
"	Bowdon, Manchester—Congregational School Chapel		W. Waddington and Son, Mansfield-chambers, Manchester.
"	Clonard, Belfast—Monastery	Rev. P. Griffith	A. Ferguson, Architect, Royal Avenue, Belfast.
"	Pontefract—Lecture Hall, &c.		Clark and Moscrop, Architects, Feethams, Darlington.
"	Swansea—Eisteddfod Buildings		Wilson and Moxham, 15, Castle-street, Swansea.
"	Bournemouth—Nave and Aisles of Church	St. Ambrose Church	Boreham and Morton, Sunderland.
ENGINEERING—			
April 30	Sheffield—Steel Bridge	Corporation	C. F. Wike, Town Hall, Sheffield.
" 30	Ball's Bridge, Co. Dublin—Widening Bridge	Pembroke Township Commissioners	The Secretary, Town Hall, Ball's Bridge, Co. Dublin.
" 30	Withington, Lancs.—Hydraulic Plant	District Council	A. H. Mountain, Surveyor, Town Hall, Withington.
" 30	Loch Efort, North Uist—Construction of Pier	Sir A. C. Orde	Blyth and Westland, 135, George-street, Edinburgh.
" 30	Winchester—Lighting Streets	Town Council	Surveyor, Guildhall, Winchester.
" 30	Hayfield—Five Flushing Tanks	Rural District Council	H. Bancroft, 88, Mosley-street, Manchester.
May 2	Belfast—Supply, &c., of Crane	Harbour Commissioners	G. F. L. Giles, Harbour Engineer, Belfast.
" 2	Upholland, near Wigan—Water Mains, &c.	District Council	Heaton, Ralph, and Heaton, King-street, Wigan.
" 2	Glasgow—Construction of Railways	Caledonian Railway Company	G. Graham, Buchanan-street Station, Glasgow.
" 4	Leicester—Construction of Detritus Tanks	Highway and Sewerage Committee	E. G. Mawbey, Borough Surveyor, Town Hall, Leicester.
" 4	Barrow-in-Furness—Washing Machinery	Guardians	J. Y. McIntosh, Cornwallis-street, Barrow.
" 5	Belfast—Waterworks	City and District Water Commissioners	W. A. Stephens, 41, Donegal-place, Belfast.

" 24	East Ham—Offices, Fire Station, and Public Baths	£105, £52 10s.	Urban District Council.
July 1	San Francisco Bay—Designs for University Buildings	£10,000 (divided in two competitions)	Trustees of the Phebe A. Hearst Fund; represented in England by the R.I.B.A.
" 1	Formby—Schemes for Sewerage	£100, £50, £25	Formby Parochial Committee.
" 2	Warrington—Designs for Police Station, Court House, &c.	£100, £50, £25	Town Council.

THE ECONOMY AND MORALITY OF COMPETITIONS.*

By B. CRESWELL.

THE idea of treating this subject from the basis of economics originated in some articles which appeared two years ago in A. A. Notes. It was thought that if actual statistics could be collected the whole system of competitions as now conducted could be proved to be a commercial absurdity. It was only after the figures which are here presented had been collected that the writer discovered that twenty years before Mr. Thomas Porter, F.R.I.B.A., had worked precisely on these lines, and had, by carefully constructed tables, demonstrated the folly of the system from an economic standpoint. A review of the various public protests against the system during the century constituted in papers read, debates, resolutions passed, and reports of special committees deputed to investigate the matter. The direct result of Mr. Porter's paper was the circulation, by Mr. Cole A. Adams, of a memorial signed by 1300 architects, who bound themselves to enter in competition only when a "professional adjudicator of established reputation" was employed. The fact of the activity promoted by Mr. Porter's paper and Mr. Adam's enterprise being allowed to evaporate without any positive step being taken to ameliorate

THE EVILS OF THE SYSTEM,

left the matter in a more hopeless case than theretofore. Absolute statistics are almost impossible to acquire, as Scotland and Ireland in chief limit their competitions to their respective countries, and in England probably more than half the total competitions are advertised locally only. In considering the question of public competitions it is desirable to consider it generally, and not in particular, or as affecting the individual. To this end the figures here presented have been concentrated upon a system of averages. An examination of the tabulated results of an investigation of the files of the Builder over a period of two years (1894 and 1895), and a comparison with the authenticated figures of previous investigators, shows an average competition to be for the design of a building costing some £18,000; first premium, £56, with £52 divided in smaller prizes, and there are thirty-six competitors. The cost of making a set of competition drawings for a design as above may be stated at £50, principals' time not included. The Special Committee of 1872 found this amount varied from £2 to £800. These figures as they stand demonstrate and establish the rottenness of the system from a commercial or economic point of view. As a question of policy the system is so disastrous that, even if it brought handsome monetary benefits to the Profession, it would still be advisable to forego such benefits, and reorganise the system. Competitions have crowded the Profession with amateurs, dilettantes, and persons lacking culture or education. They have been disastrous to the status of the bona fide practitioner, and have brought the Profession into contempt and disrepute of the public. They have tended to overrate the Act, and to destroy the claims of Architecture upon the attention of the nation. They have secured that a large and important division of the

NATIONAL ARCHITECTURE

shall interpret the sentiments, ideals, and aspirations of the most ignorant and intellectually insignificant class in this country—a class educated in positive ignorance and cultured in execrable artistic taste and proclivities. In 1887 the architects of Belgium were agitating for competitions "on a properly regulated system," the usage at that time in Belgium altogether precluding competitions in architectural design. A consideration and criticism of the recommendations advanced before the Central Society of Architects, Brussels. Sir Edmund Beckett, in 1881, sup-

ported our system on the ground that competition was common to all professions. A refutation of this suggestion. Conclusion, that the policy of the system (apart from its false economy) is highly prejudicial and quite irrational. A consideration of wherein the error has arisen, and upon whose shoulders the responsibility for it chiefly lies. It is the common usage to exclaim against promoters of a competition when there has been inequitable treatment of the competitors. This is unreasonable, because competitions are on a business and commercial basis. There is no suggestion of philanthropic motives or of mutual concessions for mutual benefit. In any other transactions involving such large outlay and such weighty consequences, the architect protects himself according to the commercial usage in the case, and should make no exception in the case of a competition. The system is due to no conspiracy of the promoters, but to the weakness, folly, and lack of public spirit, and *esprit de corps* in the competitors. The story of "Durham" to illustrate the feeble, poor-spirited methods of the Profession. Culpability of assessors, who approve faulty and ambiguous "conditions," and turn their backs as soon as they have delivered their report; and who consent to act in a technical question in which they have no experience or knowledge. The

CAUSE OF THE DIMENSIONS,

to which the irregularities of the promoters have developed, is due to instincts of personal ambition and worldly success in the competitors over-riding those of professional pride, and artistic enthusiasm. An exposition of the fallacy of regarding competitions from the point of view of the individual—the winner. There are thirty-six competitors in an average competition, so that each should expect to win but one in every thirty-six competed for. Each competitor who wins more than one in thirty-six implies another who wins proportionately less. Explanation of tabulated results of an investigation of some forty "conditions of competition" showing that—An assessor is most usually appointed. The premiums, with few exceptions, merge in the commission. The promoters, generally speaking, exempt themselves from accepting the "first" or the "first or any award," though the first premium is more often commissioned than not. There are hardly any instances at all of the assessor's award being acknowledged to be absolute. It is common for the competitors to pay each from 10s. to £5 before they can know the conditions upon which they may compete. A consideration of the moral influence of competitions. The system is opposed to the growth of an art, and to the artistic integrity of architects. It arouses envies and jealousies in precisely those quarters where the friendliness and sympathy are of greatest value to the man and his art. It replaces the artist's desire for power, by a restless desire for brilliant and meretricious qualities. It inculcates in the student a passion for worldly success and popular applause, and by these means it enervates the art through the artist, and destroys that brotherhood and freemasonry which is almost a necessity for the development of a great art or a true artist. It procures the commission of a certain quantity of unprofitable labour in each year to the value of which the nation is poorer and weaker. The remedy lies in a mutual recognition and spirit of combination; any restrictive code, on the lines of trades union regulations, is undesirable.

Three stained glass windows have been placed in St. Catherine's Parish Church, Pontypridd.

The foundation-stone has been laid of a new chancel which is being added to Christ Church, Crewe.

The recumbent statue for the tomb of the Duke of Clarence and Avondale is, it is understood, about to be placed upon the lid of the sarcophagus in the Albert Chapel at Windsor Castle.

In connection with the proposed restoration of Norwich Cathedral, Mr. Samuel Hoare, M.P., and Mrs. Hoare have expressed their readiness to undertake the entire underflaking of the nave at their own cost.

UNDER-PINNING A CHURCH.

REMARKABLE FEAT IN THE CITY.

THE Church of St. Mary Woolnoth is undergoing a unique experience. It is being under-pinned, in order that beneath it may be constructed a railway booking-office and a station in connection with the City and South London Railway. It may safely be said that it is the first time that a church has undergone so remarkable an operation, and so far the stability of the fabric has not suffered in the least. Tall stories having a transatlantic origin are occasionally told of hotels being bodily moved from one locality to another, but there is really nothing very formidable about that exploit, seeing that hotels of a movable kind do not possess massive foundations, like the Church of St. Mary Woolnoth. The phase through which the church is passing marks

AN EPOCH IN ECCLESIASTICAL HISTORY;

indeed, the pious builders of the church would, no doubt, stand aghast at what they would distinctly believe to be a flagrant act of sacrilege. A railway booking-office under a church, and then beneath the booking-office, deep down in the bowels of the City, another station with a fully-equipped and quite up-to-date railway! It seems very incongruous, and yet when the scheme is an accomplished fact there will be little connection between the church and railway station. The appearance of the interior of the Church of St. Mary Woolnoth, says the City Press, is not easy to describe. What

ARCHITECTURAL CHARACTERISTICS AND MURAL DECORATIONS

it possesses are lost to view behind a screen of matchboarding. The place where the floor originally was is a yawning chasm dimly lighted by electric globes, which bring into relief the shapes of monstrous iron girders, which run the entire length of the building. Anything more unlike the interior of a church could not be imagined until the eye wanders upward and sees the groups of pillars which support the roof. Strange to say, the outside walls of the church have a kind of separate existence from the central portion of the edifice, a fact which has not rendered the work of under-pinning any easier. The yawning cavern is, of course, the centre of the engineering operations. Broadly and generally speaking, the *modus operandi* is as follows: There are four groups of three columns, which have to bear a weight of about a hundred tons each. The main girders are in the first instance fixed alongside the columns, and then smaller girders, technically known as "needles," are threaded through the bases of the columns, and rest upon the main girders. In order to make the work thoroughly secure steel wedges are inserted between the "needles" and the top of the larger girders, and these take up the deflection of the latter when the weight descends upon them. The work of under-pinning the pillars of the church is almost complete, but it has been a labour which has demanded much patience. The engineers are Sir Benjamin Baker, Mr. David Hay, and Mr. Basil Mott. The contractors are Messrs. Mowlem and Co.

THE FOUNDATIONS OF THE CHURCH

contain nothing remarkable, but the imposing pillars of the church are not all they seem to be; indeed, they are frauds from a builder's point of view. From their external appearance it would be said that they were stone, but on an investigation they proved to be, if not whitened sepulchres, at least very bad pillars, for their "hearts" are composed of nothing but old brickwork. In another portion of the church the workmen saw what they believed at first was an arched stone roof, but it turned out to be a ceiling, composed of laths and plaster of the flimsiest kind. The booking-office will be about 20ft. beneath the street, access being given to it by staircases in front of the church and in King William Street. A large, oblong, segmental shaft will be sunk to the level of the line. It will contain five passenger lifts, and it is by these means that the passengers will descend. The

* Résumé of a paper read before the Architectural Association on Friday night.

shaft will be 73ft. in length by 24ft. in width, and will be constructed in an entirely new form. A shaft over 100ft deep has already been sunk on the King William Street side of the church, and the work has been rendered all the more difficult in consequence of the confined area in which it is being carried out.

NO FEATURES OF ARCHÆOLOGICAL INTEREST

have been discovered in the course of excavation. An old well was found under the north wall of the church, but it contained nothing save 8ft. of water. It is said that in the construction of the Monument Station a well was discovered which was practically bottomless—at least that is the story which obtained credence among the workmen who made the discovery. It appears to be somewhat of a stretch of imagination just now to realise that the disembowelled church of St. Mary Woolnoth will ever regain its pristine sanctity, but, nevertheless, it will be so. As soon as the surface station is made, and the interior of the edifice returned to its former conditions, there will be nothing to indicate the fact that it had ever undergone the process of under-pinning; on the contrary, the tolling bell will again call the faithful to its shrine, and if beneath the foundations of the old church there is a book-ing-office, with a railway station below that, certain it is that the worshippers will never realise it, for the close, adhesive London clay will give no echo of the world of activity existent in its very bed. The silence of the tomb itself could not be more complete than the impenetrable gloom and solitude which reign beneath the adamant streets of the City. The Shakesperian legend, "To what base uses may we not return," should never be inscribed over the portals of St. Mary Woolnoth, which will rise Phoenix-like from its present state of desolation. At any rate, it cannot be said after Pope:—

"Destruction hangs on yon devoted wall,
And nodding Ilion waits th' impending fall."

A DEVONSHIRE CHURCH RESTORED.

BBROADHEMPSTON Church, which has been undergoing restoration, is one of considerable interest amongst Devonshire churches. It consists of a nave, chancel, north and south aisles, with chancel aisles, a western tower, and south porch. From the general internal and external appearance of the church it is evident that it was entirely remodelled and enlarged in the fifteenth century, and not finished until late in that period. But in the thick chancel walls and lower parts of the tower traces of thirteenth century walling are to be found. Some little work of restoration to this portion of the church was carried out under the direction of the late Mr. Pearson, but he was not able to superintend the work himself. When the main work of restoration was commenced a year and a half ago the church was in a very dilapidated condition, and the rain poured in through the roofs in several places. The old nave roof had been supplanted by a deal one, placed there at the end of last century, but fortunately both the aisle roofs when opened out were found to be the original ones, though in a very bad condition, so much so that it was found impossible to reuse any of the old rafters; but nearly all the old ribs have been reused. Many of the principal ribs, which are exceedingly well carved, retain their old colouring, which has been carefully preserved. The finely-cut fifteenth century windows were in such good preservation that they have been repaired without taking them down; they are certainly the finest in the neighbourhood. The glass was in such a bad state that it had to be discarded. During the restoration some mural inscriptions were found upon the aisle walls, surrounded by scroll work; they were evidently executed about 100 years ago. The exterior walls have not been interfered with more than was absolutely necessary, so that natural colouring, which is so charming a feature in many of our western churches, has been preserved. The total cost of the work is about £1000. The architect for the restoration is Mr. Edmund Sedding, of Plymouth.

KEYSTONES.

PLANS for the erection of a new hotel at Chesterfield have been approved.

A NURSING INSTITUTE has been erected at Wednesbury. It has been designed by the hon. architect, Mr. Joynson.

A SCHOOL-CHAPEL is being built at Meersbrook Bank, Sheffield. The plans are by Messrs. Hemsoll and Paterson, of 18, Norfolk Row.

THE Passmore Edwards' Public Library, Pitfield Street, Hoxton, has been opened. The cost of the building, including the site, has been £20,000.

A NEW stone font has been presented to St. Etheldreda's Church in Fulham Palace Road; also a painted glass window to illustrate the life of St. Etheldreda.

THE contract for building Mr. Edward Compton's new theatre at Dover has been secured by a local firm. It is to be completed early in December.

HEXHAM's beautiful old abbey is about to be provided with a reredos. To this venerable abbey belongs the prestige of having been the first edifice in England to boast of windows.

THE Marquis of Bute has just replaced, at a cost approaching £1000, the old wooden rood-screen at St. Peter's Church, Cardiff, with a structure of Caen and Pennant stone.

THE Edinburgh Methodist Mission has purchased a block of property in Earl Grey Street, consisting of St. John's Episcopal schools and two houses, and on this site it is intended to build a hall to seat 1500, the total expenditure expected being about £30,000.

IN connection with the proposed new bridge over the Tay at Perth, the tenders of Messrs. Fraser and Morton for the mason work, and Messrs. Arrol and Co. for the steel and iron work, have been accepted. The estimates amounted in all to £19,903 18s. 6d.

ST. MARY'S CHURCH, Evedon, near Sleaford, one of the smallest parish churches in England, has been practically remodelled, the interior having been rebuilt, at a cost of about £500. The work has been carried out by Mr. F. Pattinson, of Ruskington.

A COMMENCEMENT has been made with the work of erecting a new wing to Highgate School, at a cost of about £12,000. Its extension necessitates the removal of the picturesque old school lodge adjoining the North Road, Highgate, and some shop property of great age.

THE Kesteven Asylum Committee have opened tenders for the foundations of the new asylum, which is to be built at Wilsford, near Sleaford. The tender of Messrs. Wadsley and Company, of Horbling, has been conditionally accepted, the amount of the contract being about £8000.

AFTER being closed for twelve months for extensive alterations, the Parish Church at Port Glasgow has been re-opened. The building has undergone a complete renovation, having been refloored and re-seated, while an organ-chamber has been erected at the pulpit end of the church. A striking improvement is the introduction of cathedral glass windows, the pattern being the same as that adopted in St. George's Parish Church, Edinburgh.

ONE more block of the County Council's model dwellings on the Boundary Street area in Shoreditch has just been opened. Two other very large blocks are in hand, one of them nearly approaching its full height, and the other just getting in its foundations. There will still remain a considerable piece of the land cleared of its slums, but with the two blocks now in course of erection the new housing scheme may be considered to be approaching completion.

THE building known as the Wesleyan Centenary Hall and Mission House, which fronts the point at which Threadneedle Street enters Bishopsgate Street, is likely, before long, to come down. The Wesleyan authorities will shortly erect on this central site a new Centenary Hall and Mission House, letting off the ground floor and basement for banking and other purposes, retaining the middle sections. The estimated outlay on demolition and reconstruction will not fall short of £70,000.

FLEET STREET AS IT IS: AND AS IT WILL BE.

WHY should Fleet Street wait? The question has been asked many times by those who are anxious to see brought to successful completion the scheme of improvements long promised and warmly debated in connection with that historic artery. But Rome was not built in a day, and it takes, apparently, several years to widen, improve, and generally smarten up one of the busiest—and, be it confessed, one of the noisiest—thoroughfares in London. People who talk about putting Fleet Street into proper condition, and making it

WORTHY ITS GREAT NAME

and commercial importance, and who lament the protracted nature of the operations in process of gradual development, seem to forget that some thirty-three years, or thereabouts, have flown over our heads since the movement for widening Ludgate Hill was first set on foot. And how long is it, after all, since the Corporation were enabled to put the finishing touches to that much-needed project of amelioration? Negotiations respecting the acquisition of further property in Fleet Street are momentarily suspended, and meanwhile the attention of those who show themselves to be impatient of any delay is drawn to the cheering circumstance that yet another house has been placed further back from the roadway within recent date. This is No. 89, on the eastern side of St. Bride's Avenue, and the process of reconstruction has given to that portion of the famous highway an added width of just over 20ft. It is understood that the next building at which the task of widening is to be resumed will be No. 90, adjoining the house already mentioned, and in the occupation of a well-known firm of publishers. Some months have yet to elapse, however, ere the lease of these premises falls in, and even when the work at this particular point has been carried out, frequenters of Fleet Street will again have to possess their souls in patience whilst that portion is widened—by some 17ft. 6in.—which lies between St. Bride's Avenue and Salisbury Court. A melodrama now running in the metropolis boasts among its scenic attractions

A VIVID REPRESENTATION OF FLEET STREET as it is—with its extraordinary bustle, animation, and activity, and the daily illustration it affords of that struggle for existence which has become so keen with the growth of the nineteenth century. It would be interesting were some fanciful picture to be drawn of Fleet Street as it may be in a distant future, when the old landmarks that tell of an historic past have been swept away, when ancient and dilapidated buildings have been abolished, and when in their place shall have been reared structures of an imposing and dignified aspect. Every year brings with it fresh indications that, sooner or later, the famous old thoroughfare is to be altered out of all recognition and improved out of all knowledge. At the present moment the finishing touches are being put to the brand new and commodious premises wherein the business of the London and Westminster Bank—only a step from Fleet Street—is carried on. The work of reconstruction was commenced some two years ago, and now the institution presents quite an attractive frontage of Portland stone and solid granite blocks. The building adjoining it—now Lloyds' Bank—has undergone many changes, having failed as a large and commodious restaurant. Moreover, in connection with the more pleasing of the architectural features of "That crippling street, Distinguished by the name of Fleet," its very first house is a handsome building in which the business of the famous firm of Child's is transacted. Barclay's banking house has just been closed, having been transferred, prior to rebuilding operations, to the adjacent Carey Street. Every appearance of old age have these premises, which are now to be demolished previous to the erection of a far larger and infinitely more imposing edifice, the designs of which are being prepared by Sir Arthur Blomfield.

Professional Items.

BRADFORD.—New girls' and infant schools in connection with St. Mary's Roman Catholic church, Bradford, have been erected on the site of the former church at Stott Hill. The schools are in two storeys and basements. Messrs. Wray and Co., contractors, have executed the main portion of the building, and the other contractors are as follows:—Mr. W. H. C. Joiner; Mr. M. Bland, plasterer; Messrs. J. and Nelson, slaters; Messrs. Weardon and plumbers; and Messrs. Duckett and Co., painters, lavatories. Mr. Edward Simpson is architect. The total cost is about £6000, and the schools will accommodate some 900 scholars.

ROMFORD.—Alterations have been carried out at St. Mary's Church. The chief work of the contractors has been a widening of the nave arch, and general decoration of the nave and church. This work has cost upwards of £1500, and has been carried out under the direction of Messrs. Naylor and Sale, and Mr. Hemmings, of London, has carried out the painting, &c. The walls of the main part of the church have been beautified by painting, and there are eight life-size figures representing saints. In the chancel three stained-glass windows have been added to the church. Messrs. J. and G. Walker, of Warrington, were the contractors.

BERKELEY.—A new board school has just been erected at Derker. The site of the schools is somewhat triangular in shape, and contains 8 square yards. The larger or mixed school is planned on the central hall system, having separate entrances for boys and girls with direct communication with the hat and cloak rooms. These rooms have a special feature, that of drying and fumigating the clothing of the scholars. The infants' school is placed on the lower portion of the site, being a separate and distinct building. It accommodates on the ground floor 380 scholars. The teacher's cottage occupies an angle of the site and gives full control over the various buildings. The exterior has been designed to be of solidity and proportion to its parts, no ornamentation being attempted. This work has been carried out by Messrs. James Stott (Co.), Vernon Works, Oldham. The foundations up to the ground floor line were built by Whitworth Whittaker; the super-structure by Messrs. Ogden Bros.; the masonry by Messrs. S. and J. Whitehead; the joiners' work by Mr. William Lees; the plumbing, glazing, fitting, painting, and decorating by Messrs. Chadwick and Sons; the plastering by Mr. J. J. Kelly; the slating by Mr. Joseph Jackson; the wrought ironwork by Messrs. J. J. and Co.; the lavatory fittings by Messrs. J. J. and Co.; the tiling by Messrs. C. W. Williams and Co.; the wood blocking by Mr. L. Lowe; locks by Messrs. Joseph Kaye and Co., Leeds; and the furniture by the Bennett Furnishing Co., Glasgow. The whole has been erected and superintended by Mr. Thomas J. J. and Co., Queen Street, Oldham, with whom has been associated Mr. James Hanson, clerk of works to the Board. The total cost of the buildings is about £20,000.

DEWSBURY.—An important addition to the town Church is about to be made, tenders having been invited for the erection of a chapel on the south side, opening out from the aisle. The style of Architecture corresponds to that of the main building. Messrs. J. J. and Fox, of Dewsbury, are the architects.

EDINBURGH.—Plans have been approved for a new fire station, situated at the Cattle Market, Lauriston, the cost of which will be £1000. The frontage to Lady Lawson Street and Lauriston extends to 270ft. The design is of a simple classic order, with round windows on the lower ground floor. The windows of the two upper floors are plain, with architraves finished with medallioned pilasters. The fire station proper is next

Lauriston Street. The engine house has four arched openings high enough and wide enough to permit of horses and engines attached being driven out at full gallop. There is stabling accommodation behind each fire engine. Provision has been made for dealing with the construction of fire apparatus on the premises, and workshop accommodation will be provided for fitters, blacksmiths, joiners, painters, and hose repairers. The whole of the ground floor is devoted to the requirements of the department. The first floor comprises the firemaster's residence, superintendent's residence, mess room and dormitory for the single men, married men's quarters, &c. The second floor is entirely set apart as married men's quarters. There are more quarters on the third floor, and a laundry quite apart from the dwellings. In the rear of the building is a hose tower finished with a wooden fleche about 100ft. in height, which will be used for observation purposes, and for hoisting hose after use. Beyond the engine room is an office for clerks and the firemaster's private room. A gymnasium adjoins the recreation room. Behind the main building is a spacious courtyard for fire drilling purposes, &c., and to the rear again is a secondary stable and miscellaneous out premises for storage and other purposes. Brass poles are supplied at suitable places for easy and convenient access for the men sliding down to the ground in a few seconds. The architect is Mr. Morham, the city superintendent of works.

GLASGOW.—The last sessional visit of Mr. D. Bennet Dobson's High School students took place on Saturday. The Art Galleries, Kelvin Grove, were inspected. The buildings, designed in the Renaissance style, are now well advanced, the second story being almost completed. The exterior is of red Lochaber stone, and the interior of white Giffnock stone. The cost of the building will be close on £180,000. Messrs. Simpson and Allen are the architects. Mr. Monteith, clerk of works, conducted the students.

The students of the Glasgow and West of Scotland Technical College Architecture and Building Construction Classes have, during this session, visited the following buildings and works:—Ruchill Hospital and the People's Palace, Mr. A. B. McDonald, architect; the Western Infirmary Operating Theatres, &c., Mr. John J. Burnet, architect; the Clyde Ironworks, Tollcross, new offices, 41, Bothwell Street, Messrs. James Salmon and Son, architects; Messrs. James Howden and Co.'s new works in Scotland Street, Mr. Nisbet Sinclair, architect; Pollokshaws Town Hall, Dr. R. Rowand Anderson, architect; Norwich Union Insurance Offices, St. Vincent Street, Mr. John Hutchison, architect.

Rapid progress is being made with the erection of Glasgow's new Art Galleries, which, it is estimated, will cost close upon a quarter of a million sterling. The work was commenced by the Association for the Promotion of Art and Music, but lack of funds compelled that body to hand over the undertaking to the Corporation. The Association had borne the expense of the excavations, foundations, &c., but the Corporation started the building proper in August, 1896. Since then everything has proceeded without a hitch. There are close upon 300 men and apprentices engaged, and it is estimated that the various turning, planing, sawing, and moulding machines save the labour of fully 150 masons. The buildings will cover an area of about two acres. A glance at the exterior gives only a slight idea of the substantial masonry inside, where already there have been "cast" ordinary and flat arches moulded on all exposed faces, to the number of over 200. The value of the interior stone work alone will amount to about £35,000. The main feature of the pile is the central hall, bisecting the building transversely, and leading to the east and west courts, which are roofed up about the height of two stories. Here we have two spacious courts suitable for museum exhibits and presumably statuary. These courts are surrounded by promenades which lead into the picture galleries proper and these galleries and promenades are again repeated on the first floor level. Of the chief

features of the exterior, mention must be made of the four corner pavilions, which have finely-proportioned and pleasingly-detailed circular windows. While the buildings are very extensive and elaborate in detail, the main plan is exceedingly simple. Roughly speaking, the east and west wings, composed of the courts, galleries, etc., described above, are bisected by a large central hall, the roof of which is some 100ft. from the ground floor. The most striking feature to the north, where is the principal elevation, is the central portion, flanked by two towers, each about 170ft. from the ground floor. The construction of these main towers will be unusually strong, the four corners of each tower being carried on four groups of upright iron stanchions, tied together with malleable iron tie-rods—the whole being strongly cased with cubic masonry of white stone. The external walls are built of red sandstone, taken from Lochaberbriggs Quarry, in the south country. White Giffnock stone is used for the interior.

HAMPSTEAD, N.W.—A new administrative block has been added to the public baths in Finchley Road. The old front of the baths was pulled down in consequence of the carrying out of the Great Central Railway works, and the Company paid the Vestry £8300, and gave them a larger area of ground to rebuild upon by way of compensation. The new block is built in the English Renaissance style of an early type, and has cost nearly £9000. The building is faced with red brick, with dressings of Portland stone, and the plinth is of grey granite from Aberdeen. Messrs. Spalding and Cross were the architects, and Mr. Kingerlee the builder.

HUDDERSFIELD.—The new Wesleyan schools which have been erected at Mount Pleasant, Lockwood, Huddersfield, have been opened. The schools contain three heights of floors. The principal entrances to the schools are from Pleasant Street, and face the Mount Pleasant Board Schools. There are separate entrances for boys and girls into commodious lobbies, from each of which there is a flight of stone steps leading to the gallery, and an entrance to the assembly room. There is an open timber roof, with moulded posts, filled in between the arches, which have cusped spandrels. At the back is a rostrum, having two tiers of seats at the back for a school choir, and a recess for an organ. The style of Architecture adopted is perpendicular Gothic. The front elevation has a central gable, flanked on each side with low slated towers. Many of the windows have cusped tracery heads, and the main entrances have moulded jambs and flat pointed arches with panelled spandrels and battlemented cornices over. The front gangway which unites the Gothic school with the Classic chapel is half-timbered with plaster panels. The front elevation is built with pitch-faced wallstones, and the sides and back with hammer-dressed wallstones. The whole of the work has been carried out from plans prepared by Mr. B. Stocks, by the following contractors:—Messrs. T. Bottomley and Son, masons, Lindley; Messrs. H. Hollingworth and Son, joiners, Moldgreen; Messrs. D. Taylor and Sons, plumbers, Lockwood; Messrs. T. Longbottom and Sons, slaters and plasterers, Lockwood; Mr. Richard Heaton, painter, Paddock; Mr. Fredk. Milan, heating and whitesmith's work, Lockwood. The total cost is expected to be about £4000.

MARKINCH.—A new United Presbyterian church has been built at Markinch, Fife. Built on an excellent site on the Balbirnie estate, to designs by Mr. Hippolyte J. Blanc, Edinburgh, the church is in the Early English style of Architecture, and consists of a nave with one transept and one aisle.

NORWICH.—With reference to the proposed arcade on the site of the old Royal Hotel premises, the work of demolishing a portion of the old buildings has been commenced by Messrs. Youngs and Son. The architects engaged are Messrs. G. J. and F. W. Skipper, of London Street. According to the plans which have been prepared, the present main

avenue of the old Royal from the Walk to Castle Street will be utilised. The entrance at the Market Place will be by way of a double arch, with shops—the fronts of which have been planned in circular form. At the Castle Street end the arcade will finish with a moulded gablet of terra cotta, surmounted by a finial of the same material. The shops at the entrance will be surmounted by copper domed roofs, returned against the gable. The roof will be of wood and glass, of a tasteful design, and at the intersection of the two avenues there will be a dome-shaped lantern. The arches, string courses, piers, and all the main constructive details of the interior will be faced with Doulton's Carrara ware. The string cornice above the shop fronts will be in deeper colour, raised, and panelled. The shops will be of uniform description, and the existing walls have been adapted to the general design.

PORTRANE.—The new asylum buildings at Portrane, the contract for which involves the expenditure of nearly £170,000, is the largest building contract which has ever been entered into in Ireland. The contractors are Messrs. Collen Brothers, Limited, of Dublin and Portadown. The first portion proceeded with is the building intended for the accommodation of chronic female patients. This building is three storeys high, and is a large and handsome structure, the materials used being, as throughout the entire buildings, mainly brick, concrete, and steel, one of the objects in view being that all the buildings shall, as far as possible, be fireproof. This building, which is now nearly completed, is constructed to accommodate about 300 patients. The only other three-storey blocks will be those for the attendants—one for the male and the other for the female attendants. Separate buildings will be provided in each of the two sections of the building—the one for the male, and the other for the female—for the separate treatment of acute and semi-acute cases, as distinguished from chronic cases; and there will be likewise a male infirmary and a female infirmary. These will all be on the southern side, and, like the larger buildings already referred to, will have a southern aspect; while the auxiliary buildings, such as the laundry, the engine and boiler house, the "administration" block, two places of worship, Protestant and Roman Catholic, the doctor's residence, and the workshops will face the north, on which side the public approach to the institution will be provided. In the centre, at the rear of the buildings just mentioned, the foundations of some of which have been laid, the kitchen (which will be provided with all the newest appliances), the butcher's department, the bakery, and the large dining hall will be erected. The last mentioned will be a spacious building, 139ft. in length by 66ft. in width, and will contain a gallery. It will also be provided with a stage, as it is intended to use it for the purpose of concerts and balls. The total accommodation provided in the permanent buildings will be for about 1200 persons. Mr. Richard Collen, a principal member of the firm of contractors, resides at the works, and has the assistance of Mr. Norman Leask, who, under Mr. Collen, has charge of the works. The buildings are from designs by Mr. G. C. Ashlin, assisted by Mr. A. J. McCloughlin.

ST. ANNE'S.—A Building and Finance Committee have been formed to undertake the erection of the proposed St. Thomas' Church in connection with the Parish Church of St. Anne's. The committee have been instructed by the general committee to confer with Messrs. Austin and Paley, or other architects, to get plans and estimates, the total cost of the church not to exceed £7000. The edifice will stand on the Clifton Drive, on the borders of St. Annes and Fairhaven.

SHEFFIELD.—The transformation of Chapel Walk is an interesting feature in the movement for street improvement in Sheffield. In place of the dwarfed and old-world shops and houses which a few months ago disfigured it, there is now a row of handsome and airy

shops. Chapel Walk has, moreover, been chosen as the home of another Art gallery. The Howard Gallery has been opened with an exhibition of pictures from the Goupil Gallery, London. The gallery consists of two spacious and well-lighted rooms, which have been built from the designs of Mr. A. H. Holland, the owner of the property. They are each about 60ft. in length, and the decorations are carried out in the English Renaissance style. The windows are placed in alcoves, but their light is almost superfluous, because of the lantern roof, which throws a plentiful flood of light upon the pictures. Although the lighting arrangements make the rooms peculiarly well fitted for picture exhibitions, they are admirably adapted for social gatherings. The small gallery, which is to be used for water-colours, has been decorated in tones of old gold and brown, which alternates delightfully with the pale green of the wood-work and the old Dutch tiles of the fireplace; and in the large gallery the lower tone and deeper colouring of the walls provides a charming frame for the oil pictures. The staircase windows are filled in with tinted, opalescent glass, and the entrance is floored with mosaic work of vitreous glass. Not large enough to hold any extensive collection, the gallery is well fitted to display small and choice collections, such as the one which Messrs. Goupil are now exhibiting.

TORRY.—Plans have been approved for a new Established Church at Torry. The new church is on the cruciform plan, consisting of the nave and east and west transept, with a semicircular apse at the rear. The walls will be of grey granite—square sneaked rubble—with red granite dressings. The main entrance is at the north end, and leads into a vestibule, which gives entrance to the nave and the gallery. The windows will be fitted with leaded glass. The nave and transept are entirely filled with seating, as is also the single gallery at the north end. The vestry is situated behind the east transept, and the heating chamber is below. The fittings will be of stained pine, and the walls will be decorated. When completed, the church will provide accommodation for about 800. Mr. Arthur H. L. McKinnon, Union Street, Aberdeen, is the architect.

TULLYALLEN.—The foundation stone has been laid for a new church at Tullyallen, which is a short distance from the famed ruins of Mellifont. The new church will occupy a site visible from the ancient fane. Its style of Architecture will be a revival of that in which the Irish artificers erected their sacred buildings in the romantic valley of the Mattock more than seven and a half centuries ago, namely, the Hiberno-Romanesque, with round-headed windows, semi-circular arches, and the characteristic Celtic ornamentation of spiral beads and zig-zags in its mouldings. The frontage is flanked at its northern side by a campanile tower, surmounted by an octagonal spire with cross. The tower is in two stories, and its windows are lofty and narrow. A cornice is carried round the tower below the bell-loft. The tower will rise to a height of 88ft. The height of the frontage to the roof-ridge will be 35ft. The building will be cruciform, consisting of nave, chancel, and transepts; four windows at either side will light the nave. The transepts will be lighted by a large rose window on each gable and lesser cinquefoil windows in the sides. The length of the church will be 122ft., the width across the nave 28ft., and the depth of each transept 14ft. The sanctuary will measure 27ft. by 24ft., and will have a handsome apsidal ending with windows filled with stained glass. The architect is Mr. W. H. Byrne, Suffolk Street. Mr. James Wynne, Dundalk, has the contract for the erection of the building.

WORKSOP.—A new police court has been erected at a cost of £3000 by the Notts County Council. The building is commodious and well appointed. The architect was Mr. Hooley, the county surveyor, and the contract has been carried out by Messrs. Ilett and Sons, Worksop.

Under Discussion

N. A. A.

The first meeting of the Northern Architectural Association Students' Sketching Club was held at Durham on Saturday week. It is the seventh session, and, by the influx of new members, is likely to prove very successful. A competition has always been held for the best work, and since so much has now been done, it is proposed to make up an architectural sketch book, which should compare favourably with other works of this description, for the Northern district is rich in choice examples, including Hexham, Tynemouth, Warkworth, and such smaller examples as Chester-le-Street, Ryton, Bywell, &c., besides the rich store of work that lies almost buried in the beautiful majesty of Durham Cathedral, and in the number of smaller gems that surround that noble pile.

ELECTRICAL VENTILATION.

At a meeting of the Royal Scottish Society of Arts at Edinburgh, Mr. Andrew Beal Bell, President, in the chair, Mr. Wm. Sh. Pleasance, read a paper, in which he gave a detailed description of an electric system of mechanical ventilation which he had invented. His system, he said, could be adapted to any size of building, would change the air in a hall without causing draught, and could be used in pits or mines. Part of his system consisted of an automatic switch by which primary batteries were utilised for working the apparatus.—Mr. D. W. Kemp, Leith, followed with an account of a volumetric gas analysis which he had devised for showing approximately the proportions of lead and tin in an alloy of these metals.—Mr. J. McIntosh exhibited and described a portable stand holding from one to four bicycles.

PIPES AND PIPE LAYING.

At a meeting of the Civil and Mechanical Engineers' Society, held at the Hotel Victoria, Charing Cross, Mr. B. B. Dodley, Vice-President, in the chair, a paper on "Pipes and Pipe Laying" was read by Mr. Alfred Hans. The author first drew attention to the lateness of the subject, but said he would lay the paper to cast-iron and stoneware pipes. He pointed out that to a great extent the health of the town and country depended on the use of proper pipes and several specimens were exhibited, amongst others, a fine specimen of a cast-iron pipe that had been made 100 years. One of the most important points in pipe laying being the proper jointing of two pipes, several methods were discussed, and also the various methods in different countries. The next important point was the depth of the pipe to protect it from the frost, and also the crushing weight by the passing of heavy carts over the manholes and sewers.

FEVER HOSPITAL CONSTRUCTION.

At a recent meeting of the Edinburgh Architectural Association—Mr. Thomas J. the President, in the chair—Bailie Pollock gave an address on "Fever Hospital Structures" with special reference to the new City Hospital at Colinton Mains. It was only in recent years, he said, that local authorities throughout Great Britain had been aroused by public opinion and legislation, so that infectious hospitals were now becoming general all over the country. The prime consideration for the architect of a fever hospital must be to make his structure an instrument of saving life. External appearance was not to be despised, but the internal arrangements must receive closest study and most minute consideration. With reference to situation, he remarked that well-regulated fever hospitals might be even in populous centres without detriment to the community. When the choice of a site was in view, many reasons showed that a hospital was best at a distance from the dwellings, not so much for fear of spreading disease as for the sake of the institution itself. Materials of the structure might be pasteboard, canvas, wood, brick, or

was preferred in Scotland. The laying and arrangement of buildings was dwelt upon, and it was shown how needful it was that the different diseases should be classified, cross infection guarded against; while different parts of the whole structure should be so placed as to secure greatest convenience of access between the sick rooms and administrative, culinary and other departments. Drainage, ventilation, and heating were then described as elements of essential importance, the requisite amount of floor space and air space per bed being also alluded to. The laying out of wards and of ward-scorers, baths, and lavatories was next discussed. Dwellings for the doctors, nurses, attendants, and servants were described, the most suitable arrangements for kitchen, laundry, and other services were dealt with.

SURVEYORS AT MANCHESTER.
The Surveyors' Institution held a meeting at Manchester on Tuesday of last week, it being the first ever held in the provinces. In the absence, through illness, of the President of the Institution (Mr. Christopher Oakley), the chair was taken by Mr. Robert Vigers. A paper was read by Mr. John Holden which dealt with Manchester during the fifty years 1847 to 1897. Mr. Holden showed on a map the lands built upon during this period. Manchester, he remarked, was no longer residential, excepting for those who cannot get away from it, and whom the exigencies of their lives compel to reside in it. The clearing of the insanitary districts has also tended to drive people outwards, and the railway companies and the extension of tram lines have provided facilities for many, even of the ordinary working class, to reside a mile or two out of town. The character of buildings now erected is entirely different from what it was in the past; more regard is paid to air space, sanitary matters, and to the comfort of the tenants. This applies not only to houses, but to business premises. The old back-to-back houses are being gradually swept away, and cellar dwellings have been closed for many years past. The old low-storied and ill-lighted warehouses are superseded by lofty buildings, with as much window space as is consistent with safety, in fact, an ill-lighted house is practically unlettable. The streets as now constructed are very superior. Great efforts are made to form a surface impervious to water without allowing any of it to run into buildings. Mr. C. P. Hall read a paper entitled "A consideration of some of the present-day difficulties met with in a land agent's practice."—Mr. Thomas Blashill, in a paper on "Lessons from Fire and Panic," pointed out the great risks run in minor halls, where amateur performances, bazaars, and dances are held, usually for philanthropic purposes. The responsibility of the architect, as pointed out, was not created by Act of Parliament, and was not limited by it. The architect should run no risks, and should not act as an advocate in order to minimise the cautions which public authorities demand as good advice.—A paper on "Notes on the Construction of Town Buildings," by H. C. Clarke, was afterwards given.—The annual dinner of the members of the Institution was held in the evening at the Grand Hotel. Mr. Robert Vigers, the vice-president, occupied the chair.—The Lord Mayor proposed the toast of "The Surveyors' Institution."—The Vice-President, in his reply, said the members of the profession felt a great pleasure in the Institution, which was the one to which they could rally. One aim the Institution had kept steadily in view was to give the rising generation of Surveyors the best opportunities for learning their profession—opportunities which the older men had had to do without. The Institution began in a very humble way some thirty years ago, and had now a membership of about 3000.—Mr. A. Vernon, proposing the health of the "Local Committee," said that great as Manchester was, it was still room for improvement; the streets were terribly noisy, and they were extraordinarily modest in their ideas as to the architecture of churches and chapels.

Enquiry Department.

"SPECIFICATION"

Enquiry and Legal Departments.

The replies to queries in the "Enquiry" and "Legal" Departments of the "Builders' Journal" being necessarily limited by consideration of space, readers who wish to obtain more complete and exhaustive answers are recommended to apply to the "Legal" and "Enquiry" Departments of "Specification."

Legal advice and opinions on Professional and Constructional matters will promptly be sent through the post.

Rules with regard to these enquiries will be found on page 2 of "Specification."

Terms of Subscription:—12s. per annum, payable in advance, for the first four quarterly numbers, carriage paid to any part of the United Kingdom. Subscribers abroad are requested to remit an additional 2s. 6d. to cover the extra cost of carriage.

ENGINEERING EXAMINATION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I intend studying for the examination for certificate of "Municipal and County Engineers." I am at a loss as to which books are suitable for the different subjects taken. Some are too advanced to be of use to a student. More especially am I perplexed concerning works on hydraulics and the Public Health Act as relating to surveyors. Could you inform me as to what books are suitable, and also please tell me if there is any library from which they can be borrowed?—Yours faithfully, "SUBSCRIBER."

A similar enquiry was answered in our issue of February 2nd. Perhaps, however, some of our readers who have sat for the examination may have some useful hints to offer.

A QUESTION OF COMMISSION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be greatly obliged by your opinion in the following matter: A. is a surveyor, and whilst acting in that capacity for X., a land agent, met B., the owner of some land, part of which X. purchased for a client; at the same time C., a builder, who was developing some land under X., wished to purchase two pieces of land from B. to help the development, but did not care to treat directly with B. In these circumstances he asked X. to allow A. to negotiate for him; permission being accorded, A. made one or two visits between B. and C. in X.'s time as part of ordinary business, but afterwards found that B. was only to be seen in the evening, and so for some eighteen months he has been writing letters and having interviews in his own time quite apart from X., who knew nothing of the progress of negotiations, and whom A. has left for some three months. About nine months ago B. verbally offered £5 5s. as a small present to A., but nothing more has been said, and the matter has dragged on, as I say, for some eighteen months. A. has several letters from B. asking him to see C., &c. Can A. legally claim a proper commission in the event of the sale coming off as it now seems likely to do, and, if so, how much per cent., say, on £500 to £600?—Thanking you in anticipation, yours faithfully, "SHENT-PER-SHENT."

We are inclined to hold that A. is entitled to the usual commission, as his services in negotiating seem to have been accepted by both parties. It might possibly be considered that A.'s former employer X. has a claim, but this question as between X. and A. does not seem to have been raised. If A. is not offered

a sufficient commission, it would be best to claim on the scale of charges authorised by the Institution of Surveyors, as there would be no difficulty in substantiating these. If all liability for commission is repudiated, we should think it advisable to consult a lawyer before taking action.

TO BUILD A COUNTRY HOUSE.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Would you kindly tell me the best way of seeing a choice of plans for a ten-roomed country house of plain design? Those in your back numbers are somewhat more ornamental than I require. Also, as I particularly want to use green slates for the roof, should these be close boarded and felted underneath? Again, where can I get some oak or teak interior doors, so as to keep them by me for a few months before requiring to use them? These doors are for varnishing, clear, not for painting.—Yours obediently, "COUNTRY HOUSE."

In reply to your first query, we think that your best plan would be to consult an architect who has had experience in the class of work mentioned; naturally, if you obtain the use of plans you will have to pay for them. The only other course we can suggest is that you search the columns of the professional journals, but we would add that if inexperienced you are as likely to produce a satisfactory house without expert assistance as you would be to obtain a decently cut suit of clothes without the aid of a tailor. To your further queries, any slated roof is improved by close boarding and felting in its durable, non-conducting, and weatherproof qualities. If you require new doors, you would probably obtain quotations upon stating requirements from either Messrs. Charteris and Longley or Messrs. Thos. Gregory and Co., whose addresses appear in our advertisement columns, or from the Elliot Joinery Co., Ltd., Newbury, Berks. If you require secondhand doors, an advertisement in the Daily Chronicle will possibly meet with a reply. We would advise, in the case of new doors, that you obtain them "framed up," but not wedged up, as they will season better if left loose.

IVY WOOD.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should like to know if any of your numerous readers have had any experience with the wood produced by the common ivy. I have just obtained a specimen of this wood about 9in. in diameter, and it seems to me that the wood when dry is likely to be hard, of a light yellow colour, and very durable. It contains very many medullary rays, which are quite conspicuous both on the transverse and vertical sections, the pith or medulla is of a dark brown colour and about 3in. in diameter; the cortex of the tree is extremely thick for the size of the stem, it being 3in. thick. The wood in texture is not unlike beech, though the annual rings are rather smaller, and the autumn wood is not so easily distinguished from the spring wood. There does not appear to be an undue proportion of sap wood, the weight I should judge to be about equal to acacia, though, my specimen not being seasoned, I may be wrong in my estimation. I am aware that it would not be suitable for making large articles out of, as it cannot be procured in any size, but what I should like to know is whether it warps much, its strength, if possible, and whether it is suitable for inlay work. Also any other points that your readers may have had experience with in connection with this wood will be of interest to me, personal experience being valued far above that extracted from books, as I am able to supply myself with all such information.—I remain, yours truly, "EVERGREEN."

The foundation-stone of the new Intermediate School at Penygroes has been laid. The contract has been let to Mr. Richard Jones, Llanwrda, the architect being Mr. Evan Evans, C.E., the county surveyor of Carnarvonshire.

Trade and Craft.

DICK'S ASBESTOS CO.

Dick's Asbestos Co., of Canning Town, inform us that they have taken offices at Nos. 51 and 52, Fenchurch Street, E.C.

CHANGE OF ADDRESS.

The firm of Veronese Ltd., the well-known fibrous plaster manufacturers, have removed their West End office to No. 12, Norfolk Street, Strand, W.C. The firm has issued a circular containing particulars of a few of its specialities, including the Gypsite productions. Photos or specimens of the latest designs in this material or in fibrous plaster will be supplied on application.

ELECTRICAL INSTALLATION.

The Liverpool and London and Globe Insurance Company has issued a book of rules under which they are prepared to allow electrical installation at current rates. Evidently care has been taken, in framing the conditions, to provide all due safeguards. It is pointed out that the principal sources of danger are:—(1) Inferior materials and workmanship, particularly in joints, fittings and connections; (2), conductors of inadequate size and conductivity; (3), perishable and inferior insulating material; (4), dust, dirt and moisture; (5), undue heating; and (6), neglect of frequent testing and inspection. The Company announces that no installation can be accepted in which it is found that these dangers are not reasonably provided against, but the obvious precaution is to employ competent people to carry out the installation. The rules are divided under several headings, and so minutely detail the necessary work that the electrician himself might with advantage peruse them.

CALLENDER'S PURE BITUMEN SHEETING.

Architects and builders are often confronted with the problem of effectually preventing dampness. Even when built with well-seasoned material a building is sometimes liable to become damp by reason of the site either being on marshy land or openly exposed to our varying climate. Many are the inventions designed to meet the difficulty, and no doubt one of the best is Callender's Pure Bitumen Sheeting, for which Messrs. Callender and Montgomery, of 43, Essex Street, Strand, W.C., are the sole selling agents. The material used in its manufacture is obtained from Asphaltum Lake, Trinidad, and is said to possess unique advantages for making walls, floors, &c., impervious to the dreaded moisture that too often ruins wall decorations, rots the floors, and sometimes renders the rooms of a dwelling dangerous for habitation. Callender's Pure Bitumen Sheeting does not contain coal tar or other artificial products, but is manufactured in its natural state, and is supplied ready for use in lengths of 24ft., of any width up to 72in. It is easily and quickly laid, the different pieces being jointed together to form a complete waterproof covering, while another important point is that it is elastic, without any risk of cracking when bent, and will not give way, as ordinary cement or brickwork, on a settlement. It is made in many thicknesses, and therefore is adapted for all kinds of construction. It has already been extensively used by the various railway companies in the United Kingdom for covering arches and bridges, whilst it has been largely employed for lining reservoirs, basements, cellars, swimming baths, storage chambers, culverts and conduits for sewage works, and also in damp coursing, covering flat roofs, &c. The catalogue published by the makers contains numerous illustrations of well-known buildings and bridges in which the material has been used. The manufactory is at Belvedere, Kent.

ments, cellars, swimming baths, storage chambers, culverts and conduits for sewage works, and also in damp coursing, covering flat roofs, &c. The catalogue published by the makers contains numerous illustrations of well-known buildings and bridges in which the material has been used. The manufactory is at Belvedere, Kent.

LUNDBERG'S ELECTRIC LIGHT FITTINGS.

From the Bradbury Electrical Works, Bradbury Street, Kingsland, London, N., Mr. A. P. Lundberg supplies all the apparatus for the installation of electric light on the latest principles. A cursory glance at his catalogue shows that amongst the productions are the latest kind of switches, including the "Improved Pioneer," which is said to be admirably adapted for high-voltage circuits on account of its quick and long break; the "Unique," made in four sizes, up to fifteen amperes, and largely used for staircase, corridor, and bedroom lighting; the "Midget," the "Main," the "Bowspring," Pear, and the "Tumbler." Mr. Lundberg gives special attention to wiring. That known as the "two-way" has become very popular of late. In this system two switches are used, so that the current to the lamps may be turned on or off by either switch. Thus, on entering the house, the switch near the door is turned on and the whole staircase is illuminated; on reaching the other end of the system (which can be arranged for any particular floor or room), the lamps can be turned off, if required, by the duplicate switch. Then there is the "intermediate" wiring, which is applicable where it is desired to be able to turn the lamps on or off from any floor or room, instead of from the two terminal points only. Mr. Lundberg also supplies various patterns of wall and floor connections, plugs, fuse boards, adapters, cut-outs, ceiling roses, and, in fact, all kinds of electrical fittings.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BRENTWOOD (Essex).—For the erection of workshops, for the Hackney Union Guardians. Mr. W. A. Finch, architect, 76, Finsbury-pavement, E.C. :—
Potter ... £4,150 | Lambie, Rhyl-street, ... £3,723
Barrett and Power ... 3,970 | Kentish Town* ... 2,373
* Accepted.

BURNLEY.—Accepted for the erection of eight houses, Victoria-terrace, Brierfield. Mr. Dent, architect, Railway-street, Nelson, Lancs. Quantities by the architect:—
Masonry (labour only).—W. Dent, Brierfield, Burnley ... £575 0 0
Joinery.—G. Pollard, Nelson ... 930 0 0
Plumbing.—C. Tattersall, Brierfield ... 370 10 0
Plastering.—Hartley Bros., Nelson ... 184 11 3

BURTONPORT (co. Donegal).—For the erection of a church. Mr. E. J. Toye, architect, Strand, Derry:—
Daniel McCaffery, Strabane, co. Tyrone* £1,640 13 1
Lowest of Three.

CARDIFF.—For the erection of St. Paul's New Congregational Church, Cowbridge-road, for the Committee. Messrs. Veall and Sant, architects, Cardiff:—

For the church, exclusive of galleries including galleries to seat 474.		For the church, exclusive of galleries including galleries to seat 878.	
Shepton and Son	£3,595 3 0	£4,164 0 0	
W. Mathias	3,520 0 0	4,046 0 0	
Symonds and Co.	3,460 0 0	4,020 10 0	
O. Purnell	3,468 0 0	3,975 0 0	
W. H. Ingleson	3,350 0 0	3,936 10 0	
Knox and Wells	3,417 0 0	3,929 0 0	
Turner and Sons	3,280 2 3	3,823 4 6	
C. C. Dunn	3,104 0 0	3,523 8 0	
W. T. Morgan	2,950 0 0	3,411 0 0	

[All of Cardiff.]
* Reduced to £2,640, and accepted.

EGHAM.—For the erection of villas and shoeing forge, Egham Hill, for Messrs. W. and E. Oldridge. Mr. J. W. Ondes, architect, Egham:—
W. Simpson ... £1,366 16 6 | C. Buckeridge* ... 2,083 0 0
W. Beauchamp ... 1,128 0 0 | W. Latchwell (with-drawn) ... 940 10 0
C. Searle ... 995 10 0
* Accepted.

EYNSHAM (Oxon).—For alterations to "The Tannery," Eynsham, for Messrs. Hanley and Co. Mr. H. Quinton, architect, 15, Magdalen-street, Oxford:—
Woolbridge ... £238 | Robinson (accepted) ... 235
Wilkins Bros. ... 235

LEEDS.—For additions to the Friends' School, Raw for the Bicentenary Committee of the Rawdon Free School. Messrs. Jackson and Priestman, surveyors, quantities by surveyors:—
D. Jenkins ... £991 5 5 | H. Kendal ... 2,068
J. Walker & Sons ... 831 0 0 | T. Obank & Sons ... 614
William Atkins ... 776 0 0 | W. Fletcher & Sons ... 614
W. Hargreaves ... 710 12 5 | Rawdon (accepted) ... 614

LLANELLY.—For the erection of school buildings (boys' school, with additions to the infant department) the School Board. Mr. J. B. Morgan, architect, New-Llanelli:—
D. Jenkins ... £3,340 0 0 | T. and J. Brown £2,620
J. Evans ... 3,103 0 0 | B. Howell & Son ... 2,596
G. Mercer ... 2,885 0 0

LLANELLY.—For the erection of a school, St. Paul for the Llanelli School Board. Mr. J. B. Morgan, architect, Llanelli:—
D. Jenkins ... £2,505 | G. Mercer ... 2,505
J. Evans ... 2,361 | B. Howell and Son ... 2,361
T. and J. Brown ... 2,190

LONDON.—For repairs and repainting Homerton School, for the School Board for London:—
Stevens Bros. ... £263 10 | Marchant and Hirst ... 263
Grover ... 594 0 | Silk and Son ... 594
Cruey ... 571 0

LONDON.—For the erection of house and stable College-road, Dulwich, for Mr. Walter Hoggan. Mr. E. J. Sadgrove, architect:—
J. and C. Bowyer ... £6,400 | Ham and Son ... 6,400
W. Young ... 6,240 | J. Bowyer ... 6,240
Lyle Manufacturing Co. ... 6,100 | Edwards and Medway ... 6,100
W. Smith ... 5,984

LONDON.—For pulling down and rebuilding "Gladstone" beer-house, Walworth, S.E., for the Chester Brewery Company, Limited. Mr. T. Walter M. architect:—
C. Ansell ... £1,653 | Ham and Son ... 1,653
W. Smith ... 1,428 | Summerford ... 1,428

LONDON.—For pulling down and rebuilding Nos. 40, 42, Broadway, Stratford, E., for Alderman George I. Mr. Edwin C. Stimson, architect, 22, Abchurch-lane, F. Gate, E.:—
Yerbury and Sons ... £7,993 | W. M. Norton ... 7,993
W. Gregar ... 7,993 | J. Smith and Son ... 7,993
G. J. Hosking ... 7,740 | W. Shummur ... 7,740
W. Downs ... 7,667 | A. Reed and Son ... 7,667
Colls and Sons ... 7,665 | W. H. Lorden & Son ... 7,665
Patman and Fothering-ham ... 7,650 | W. Gladding ... 7,650
Snowin Bros. ... 7,650
* Accepted.

LONDON.—For surface water sewers in Tottenham and High-street, Hornsey, for the Hornsey Urban District Council. Mr. E. J. Lovgrove, engineer and surveyor:—
W. Walker ... £2,736 | G. Ball ... 2,736
Williamson and Sons, Ltd. ... 2,650 | Jackson and Son, Ltd. ... 2,650
Pedrette and Co. ... 2,639 | T. Adams, Green Lanes* ... 2,639
Neave and Son ... 2,425 | C. Ford ... 2,425
* Accepted.

[Surveyor's estimate, £2,306.]

LONDON.—For alterations at the "Prince of Wales" public-house, Prince of Wales-road, N.W., for Mrs. G. Messrs. Lewcock and Calcott, architects, 88, Bishopsgate-street, Within:—
Maple and Co. ... £2,750 | Goadey ... 2,750
Bertram ... 2,520 | Green and Smith ... 2,520

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

WITH SURVEYING AND SANITARY SUPPLEMENTS

OUR CRITICS AT THE ACADEMY.

No. I.—THE ARCHITECTURAL ROOM.

IT is difficult for anyone possessing a sense of humour and of the fitness of things to take this room, called "Architectural," very seriously. The white, woe-begone look it wears compared to the Painting and Sculpture Galleries is irresistibly amusing. The place always seems to apologise to the public for the very poor show it has to offer. There are some, there may be a dozen, pictures that appeal to artists who are not architects, but the remainder are interesting only to those architects who are not artists. This may seem unkind, but it is as true as it is unhappily trite. It does not matter much perhaps. If the exhibits in the room are "caviare to the general," we could, with patience, survive that, but that artists themselves weary of it and are only known to visit the room when captured and led there by an architect friend is dispiriting to say the least of it. We recall—not with much pleasure—the look of astonishment on the face of a certain well-known R.A., a painter (and an artist), when a friend of his, an art critic, asked to be "shown the way to the Architectural room." "Are you serious?" said the painter. "Certainly," said the critic; and together they went in search of it. It is on record that they stayed in the room fully ten minutes, sighed simultaneously and left! Some weeks after, at the end of the concluding "Royal Academy Notice" in the pages of a great London daily, appeared these words: "The architects are best left to themselves." This then is the total result that representative Architecture of to-day in Britain makes upon the public. Think, ye of an optimistic turn of mind, "*Architecture—the greatest of all the Arts—is best left to itself.*" Architecture, formerly the Queen of the Arts, cannot to-day arouse even ordinary interest—enthusiasm is out of the question. "We should make some progress in Architecture," said one of the artful crafty ones the other day, "if it weren't for architects"—a vitriolic kind of saying, which has some truth, as Shaftesbury Avenue and the Architectural Room at the Academy testify. The fact is, that which is best in modern Architecture is nearly always unrepresented there. What for? Will you find the work of the great master builder, Philip Webb, within the walls? or that of John Bentley? or of Gilbert Scott, the younger? It is true we have occasional glimpses (dimly through the veil of inadequate illustration) of Norman Shaw and of Bodley. The former this year, however, has nothing, and the latter is disappointing. The truth of it all is, that the many of the architects who are artists, like Kipling's hero, "*don't advertise.*" But is this fair to their art and brother artists? We imagine their reply would be; "If you want to know of our work, go and see the reality." Yes, but how many architects could name and place their buildings? How many more would be stimulated and fascinated by such work, and led to study the actuality of their own gain if the authors of it would only permit of its illustration on the Academy

walls? It is a debt, we venture to say with all respect, they owe to their fellow workers, to their art, and to themselves. By so doing, they would leaven the awful lump of modern building, and lead us in the end to better things. For the present, however, we must content ourselves with what pearls we can find in this year's exhibition, and hope that these words which are worth the saying, and should have been said long ago, will tend towards producing a room at the Academy which may justly be called architectural. We can wish for no better result than that.

The dozen picture exhibits we referred to at the beginning (to be quite just, there may be a few more than that) are, for the greater

course, is the usual thing. Year after year complaints are made of the same kind until it becomes exasperating, but it makes not the slightest impression upon the worthy carpenters, to whom such matters are evidently left.

The exhibits possessing the most distinction and interest are those by Mr. Wilson of his new church at Brighton, illustrated by a strong, yet nervous charcoal drawing, most admirable and telling in its general effect—the most artistic picture in the room; Mr. Nicholson's interior of Saint Alban's, Southend, a really beautiful water-colour of a broad, simple, and dignified church interior, which, by the way, was one of the

TOMBS FROM THE OLD MONASTERY BUILDINGS, MONTSERRAT. CLOISTER OF THE ATRIUM.

part, the works of men well-known, illustrating well-known works. There is nothing startling. There is nothing fresh; and yet, as a whole, the exhibition is distinctly better than last year. There is a good deal that is very disappointing hung well, and much that is very good hung badly. Bird's-eye views, such as that of "The Roedean School," by Mr. Simpson (an excellent example of his severe and balanced work, and shown by a sympathetic drawing by Raffles Davison) are skied, when, of course, they should be on the eye-level; strong colour and pen drawings, which would bear a little distance, are line hung. But all this, of

most inspiring results of last year's competitions; Mr. Leonard Stokes' three drawings of "Shooter's Hill House at Pangbourne," the finest example of domestic work at the Academy, and probably one of the best works of Art he has ever produced. How beautiful that and Mr. Stokes' own delightful house look from the Thames in the evening sunlight all lovers of Pangbourne know by now. The drawings illustrating the house (in coloured chalks) by Mr. E. A. Rickards are strong and artistic—a little crude, yet full of life and light, of colour and "go." Then there is the pen drawing by the same artist, of the winning design for the New Town Hall and

Law Courts at Cardiff, by Messrs. Lanchester, Stewart, and Rickards. This is the best result that the competition system has produced for many a long day. Broad and big in handling the design as a whole is beautiful, and the plan (which is not shown) is a masterpiece. Cardiff is to be envied its future Town Hall, and competitions will receive an impetus from this result better than all the defence the Institute can give them.

Mr. Belcher's design for Colchester Town Hall and for the Cambridge Guildhall, both of which are on the right hand wall as you enter, have been illustrated in our pages, but the former design has been amended and improved and illustrated anew by that well-known and admirable water-colour painter, Mr. McGuinness. Mr. Belcher also contributes a fine detail drawing in water-colour, illustrated by himself, of the upper portion of the Colchester Town Hall. We admire the "quality" of the work here much more than in the perspective view. Another picture possessing much distinction shows the interior (the entrance hall) of a house at Pangbourne, with a vaulted stone roof decorated with strap work, so fresh and excellent in design and drawing, and so different to the exterior of the same house (illustrated by a pen drawing, which looks as if some accident had happened to it) which hangs above it. We were just on the point of borrowing a step-ladder from the carpenter (these notes were made on Varnishing Day) in order to see what was really the matter with the drawing and to read the signature, when a painter friend came in and carried us away to see Abbey's grand picture (from "King Lear") in the centre of the end of gallery No. 2, which made us forget all about Architecture for the rest of the day. So Mr. Mountford's splendid model of his Liverpool Museum, which shows to such advantage and helps the exhibition so much, and Messrs. Read and Macdonald's "Country House" and the "Westmoreland Church," by Mr. Hawes, both of which are illustrated by excellent models, must be left for another visit.

C. E. M.

NO. II.—THE PICTURE GALLERIES.

It will be found that the writer of this short notice has given about 1000 words to as many oil paintings, and certain it is that he has not exhausted the subject. "A cultivated rejective instinct" is the *sine qua non* of the critic, he said to himself while engaged in collecting his thoughts, and observed that were he to treat of the same, even summarily, he would provide unsolicited material for an extra special supplementary number of THE BUILDERS' JOURNAL. The effect of a first visit is generally to crowd the brain with such thoughts. The average is high, and the amount of creditable work most remarkable. The idea would still appear to be general, although it has been ridiculed often enough, that the President must produce the best; the R.A.'s, out of respect to their superior, something only a little inferior; and the A.R.A.'s something a grade below that; but the fact, of course, is that the surprise of the year is always prepared by someone but little known. It is not for surprises that the writer is looking, however. He believes most sincerely that English Art has a place of its own in the world, and that whenever a picture is shown that mirrors its little of life—be it that of the soul or the body; be it landscape, seascape, portrait, or anything else; a picture in which the paint and the painter are the last to be thought of—we then may be sure there is health in the country's Art. In every annual exhibition works for the most part unnoted may be

counted by hundreds which agree with the description just given, and the writer takes infinite pleasure in observing how many there are. The pity is, and he feels it, that he may not attract attention to each of such paintings. The necessity of criticising—that is to say, praising or blaming the merely notorious—is incidental to the critical habit. If one's enjoyments could only be measured and paid for as one's opinions are, how different the world would be! The foregoing must be his apology for himself, and for what is to follow, namely, a few scattered appreciations suggested by painters whose works, great or small, agree with the idea he has of what pictures should be. During the hours that are spent in Burlington House our recollections of the world's masterpieces may be temporarily ousted, but within an hour of leaving the place they are present again, and we are then better fit than we were to compare English Art of the year 1898 either with that of our contemporaries or with what we have had in the past. In the first of the galleries there would seem to be nothing remarkable. The Academicians whose pictures are there have their best in the other rooms. What has been said of the eldest need not be repeated. The pure pleasure of praising is to be ours, and even if space were given we would not avail ourselves of the opportunity. An Academician who shows not a sign of declining strength is the painter of the beautiful portraits in Room II.—Nos. 101 and 163. "October" (No. 152), by Stanhope Forbes, although a grey and sunless picture, cannot fail to delight the lover of Architecture who also knows something of Art. We are outside of a Cornish church, perhaps, the wall of the yard between ourselves and the building. The paintings above mentioned will be found in the second room. In the third, No. 240, by W. H. Margetson, was the first to attract attention. The writer has formed a habit based on a single experience of looking eagerly for this painter's works. The scene, so far as he remembers, is occupied almost invariably by a single female figure, a figure taken from life, that is nevertheless shaped by the soul, and of subtle and singular beauty. No. 243, by Mr. Orchardson, represents a husband in "Trouble," and varies so little in the manner of painting, the internal arrangements, and in the disposition of the two figures—who, as usual, are husband and wife—that it can only be described as characteristic and typical. Mr. Andrew Gow, R.A., is a dramatic artist of the highest order. His power is shown here in the only way in which a painter can show it, namely, by concentrating his attack, and making the utmost of the situation. The technique is simply superb, but one thinks last of that, if at all. Mr. William Bougereau's picture ("Les Petites Amis") of the two children is sweet beyond description; but even this cannot be said without encroaching somewhat upon space, and the comments upon other pictures must be made even shorter. In the fourth gallery the pictures, either remarkable or beautiful, or both, are "Sappho," 307, by Laurence Koe; "The Masters," 326, by Alfred Parsons, perhaps the finest landscape exhibited; "Ripe," 329, by Th. E. Macklin, a girl with a barrowful of apples; "Fortune and the Boy," No. 331, by John M. Swan; "A Glimpse of the Sea," 353, by Frederic Staepoole, scarcely a glimpse even, so small is the picture, but one is most grateful for it; "Katherine," a portrait, 346, by J. H. Boughton, R.A. E. R.

THE Royal Academy banquet took place on Saturday night at Burlington House. Sir E. Poynter, the President, was in the chair, and there was a very large and distinguished gathering of guests. The Prince of Wales was amongst those present.

ART IN THE VILLAGE.

A CRUSADE IN CRAFTS.

THE Cambridge County Council can boast of having successfully introduced half a dozen flourishing village industries into the somewhat sleepy arena of rural life. Considerable opposition met the efforts of the Council to introduce carpentry, smithy work, basket weaving, and other arts and crafts into the villages of the county. The result of its labours in the cause of education has more than justified perseverance, and admirable specimens of various handicrafts, of bent iron and repoussé work, may now be seen, which have been turned out by hands straight from the plough. At Newton, a tiny hamlet with a population under 200, some eleven young men were found actively hammering copper and brass into decorative designs, the scene presenting such an artistic picture as may be found in the bent iron and metalwork schools throughout Belgium. Close by, in a disused coach-house, half-a-dozen villagers gathered round a forge were busy at the bellows fashioning the tools necessary to repoussé, soldering, and finishing off their handiwork. "All these men have been sowing barley to-day," said Mr. Hurrell, the squire, who for the past seven years has devoted most of his evenings to the technical teaching of the villagers. He procures their designs, instructs them in the various stages of their pupilage, and disposes of the finished work. "Many people send us orders for repoussé wedding presents," he said, showing a beautiful beaten brass mirror frame being finished by a boy "from the plough" in time for a fashionable London marriage. Very simple tools are used, and these the pupils learn to forge for themselves, so that they may hold a complete craft in their hands. The crusade in crafts began at Newton in 1890 with

A CLASS IN MOSAICS.

an art which proved most teachable to village pupils, but the market becoming somewhat uncertain, bent iron was the next stage in artistic evolution, passing later on to repoussé, which is a flourishing industry, and offers a good market. In this little village a good repoussé worker may earn a shilling a night, the "working night" averaging an hour and a half, such a sum representing a material addition to the income of a farm labourer. Boys on leaving school are eligible to join the class, so that latent artistic skill has every chance, in this fortunate little hamlet, of early recognition. It is quite a revelation to find that a beautiful copper overmantel, which would adorn the "stateliest home," is the "spare time" work of a ploughman. At the neighbouring village of Fowlmere a very different class of crafts holds the rural taste, for in each instance the arts taught are the outcome of local selection. Fowlmere distinguishes itself by basket-making, chip carving, and carpentry.

AT THE CAMBRIDGE TECHNICAL INSTITUTE.

The Cambridgeshire County Council receives much encouragement in its technical enterprises from squires and farmers alike, who aver that their labourers, after going through a carpentry course, are well worth an extra two shillings a week from their capacity "to use their hands." At the Technical Institute in Cambridge forge and smithy classes are held periodically, and to these farm labourers from every part of the county are welcomed, their travelling expenses being paid by a County Council grant. A course of such smithy work frequently converts a clumsy labourer into a smart worker, invaluable to his employer from his capacity for repairing machinery and doing effective smithying on the farm. Such a labourer not only earns extra wages, but his mechanical skill ensures him steady employment, and raises the standard of excellence in work generally.

SPAIN:

Its Picturesque Cities and Monasteries.

THE MONASTERY OF MONTSERRAT.

By F. HAMILTON JACKSON.

(Continued from page 214.)

THE monastery of Montserrat owes its existence to an image of the Virgin, said to have been carved by St. Luke and brought to Barcelona by St. Peter in the year 50 A.D. At the Moorish invasion in 717 the Goths hid it in a cave in the hill, where it remained until 880. That year some shepherds were attracted to the spot by heavenly lights and sweet music; and this being noised abroad, Gondemar, the bishop of Vich, guided by a sweet smell, found the image, which he determined to take to Anresia. But at the spot marked by the cross already mentioned he refused to proceed further. There it was consequently deposited, and a chapel built over it. Round this chapel a nunnery was erected, and in 976 this was enlarged and converted into a Benedictine monastery. The image rested on the primitive altar about 700 years, until a new chapel was built in 1592 by Philip II., to which it was moved under Philip III.'s personal supervision on July 11th, 1599, as an inscription in the cloister records.

In 1811 the French, under Suchet, paid the image a visit—not for purposes of pilgrimage. They amused themselves with hunting the monks like wild goats first, and, having butchered them, proceeded to the monastery, where they plundered the altars, hanged the monks, robbed even the poor pilgrims, and burnt the fine library. They also carried off the stores and arms provided by England for the Spaniards, which had been taken to Montserrat under the supposition that it was an impregnable place. In 1835 the monastery was suppressed, and despoiled of its vast treasures accumulated during the middle ages. At the buildings were allowed to remain, as well as a few of the fathers to take care of the shrine, and of late years the church has been restored and largely rebuilt, and the accommodation for pilgrims immensely increased. The facade of the church is that which Philip II. the Second built, as well as the cloister in front of it, a somewhat handsome Renaissance composition. Within is a Retablo carved by Esteban Jordan and a fine screen or iron screen, made by Cristobal de Alamanca in 1578. These must have belonged to the earlier church, and it was in that also that Loyola watched before the Virgin, previously to dedicating himself to her as her knight, and the founding of the order of the Society of Jesus, as an inscription in the Atrium records; he then laid his sword on her altar, which sword is now preserved in the church of St. Belem, at Barcelona. The holy image is placed in a little chapel behind the high altar, to which the faithful ascend by steps, and having said their prayer and kissed it, descend on the other side, placing their offerings in a box which projects invitingly in their path. It is a small carved wooden image holding the child in its lap "regularly handsome, but the colour of a negro woman," and possesses magnificent robes and jewels. In 1811 it was solemnly crowned with a crown sent from Rome by the Pope Leo XIII. Quantities of *ex votos* are offered at the shrine—wax models of ships, limbs, pictures and other, jewels and silver hearts. It is one of the most celebrated images in Spain, and is the patroness of Catalonia. It is visited by more than 80,000 pilgrims annually still, though shorn of much of the pomp and glory of 100 years ago. Then there were seventy monks in the monastery, twenty-eight lay brothers, twenty-five singing boys, with surgeon, physician, and servants. Its possessions then consisted of numerous hamlets, besides quantities of plate and jewels, including eighty-five silver lamps. Of these the French recovered seventy-four, professing that their instant burning before the image was pagan!

The entrance to the church from the monastery is over a little bridge on the north side at the height of the clerestory, and the monks are not visible to the public at all, excepting, of course, the guest-master, who arranges for the lodging of pilgrims. There is a choir containing boys' voices, which is well-trained, and a "Salve Regina," sung by them in the dusk, when the church is only lighted by twinkling tapers, affords an emotion to those who are sensitive to such influences.

The path which leads to the Virgin's Cave, "La Cueva de la Virgen," crosses the funicular railway just above the one tunnel which pierces the shoulder of the mountain, and descends rapidly, following the contour of the precipices. It is about a quarter of an hour's walk to the chapel, which contains the cave with a pieta within it under a great arch, over which the fabric of the chapel is built, a Renaissance structure rather Italian in appearance. From the oratory by the main road, at the last turn towards the monastery it looks very picturesque. This oratory and the one called the hermitage of St. Asiscle, which has an avenue of cypresses leading to it, and what purports to be a portrait statue in a niche over the door, lying a little above the road and to the east of the church, are the only really old buildings left. They date from the twelfth century. Most of the hermitages have been so much restored as to be uninteresting, or have been left ruined as they were after the French occupation. From the hermitage of St. Asiscle a path leads by the north of the church back to the atrium, from which unusual point of view the combination of the towering wall and great buttresses of the church, with the lofty and strangely shaped peaks of the

mountain seen over and through them, produces an impressive effect.

To ascend towards the summit of the mountain, which is where the hermitage of San Geronimo is situated, on a peak directly above the monastery, but nearly 1000ft. higher, one descends to the resting place outside the gateway before referred to, passes by the station and the mule stand, and takes a woodland path on the other side of the gorge.

Immediately a mendicant is seen, who tells you that he subsists on the charity of those who ascend the mountain, and that he is authorised to collect your alms! After this the path begins to ascend and winds through bushes, flowering plants, and shrubs, which in the month of May scent the air with their fragrance and delight the eye with their beauty. I am no botanist, nor is this a botanical article, though one might be written upon the flora of Montserrat, which comprises many strange forms not met with elsewhere in Europe, but I may mention a few plants which caught my eye—ilex, juniper, olive, several ericas, broomrape, several sorts of cistus, several sedums, whortle berries, box (which grows to a large size, and from which the monks used to carve spoons, which when stained red were sold to pilgrims to assist digestion!) a magnificent henbane growing to the height of 30in. or so, and a beautiful flowering rush of a pale amethystine blue, the blossom resembling *triteleia uniflora* in shape and marking. Wild roses are seen occasionally, and cyttus, marigolds grow wild by the wayside, and pink valerian hangs in masses from walls and stony shelves. Here, as in much of the rest of Spain, the difference between barrenness and fertility is a question of water supply, and in

PASSAGE BEHIND THE CHURCH, MONTSERRAT.

those places where the earth lodges, and remains damp, the vegetation is profuse and luxuriant. True statesmanship should suggest to the Spaniards of the ruling caste a policy of irrigation and tree planting, which would, before many years, increase the prosperity of the country enormously.

Although for the sake of the view a clear atmosphere is to be desired when visiting this most picturesque place, the effect of the mountain itself is much enhanced by a mist such

MONTSERRAT: THE CHURCH FROM THE EAST.

as one sometimes sees on an autumn morning in England. Then the jagged peaks appear and disappear as the mists thin or thicken, and the clearing away which discloses suddenly so many miles of landscape at one's feet produces a most startling and unusual effect. As one wanders along the narrow mountain paths, or stays for a while in perplexity, the scent of flowers and of resinous trees comes in wafts from plants which are invisible, and ever and anon one hears the bell sounding from the church where prayer seems to be made without cessation. And then the sun breaks through and the mists clear away, and one sees again the paths winding along the face of the precipices, ascending as they do to bare grey summits or descending to sheltered valleys filled with evergreens and flowers, and the wonderful distance is again spread before one's eyes in its perennial beauty.

As we left the monastery one of these mists began to unroll from the mountain top, and as we descended to the valley the cloud gathered and increased till the whole summit of Montserrat was hidden by a mysterious veil—fit symbol of the darkness which broods over the minds of the pilgrims whom we met ascending towards the shrine, some few riding, but most of them on foot; the last company whom we encountered on the bridge of Monistrol consisting of a number of peasants or labouring men, who were barefoot and clad in white bordered smocks, girdled with rope and with white caps on their heads, carrying tapers and rosaries in their hands. Some were young, some older, and they were conducted by a man who was shod and dressed in Catalonian costume. We exchanged a "buenos dias," and went our several ways, they to worship at the mysterious shrine in the clouds, we to busy Barcelona.

A LOCAL GOVERNMENT BOARD inquiry has been held at Wakefield with reference to an application made by the City Council for sanction to borrow £14,776 for purposes of street improvements, and £1224 for works of sewerage.

The Governors of the Belgrave Hospital for Children have decided to transfer the present hospital to a site in Kennington, adjoining St. Mark's Church, in the Clapham Road. The sum of £50,000 is required to carry the scheme into practical effect.

MANX CROSSES.*

By P. M. C. KERMODE.

THE Early Christian stone monuments in the Isle of Man, of which about 100 have been brought to light, extending over a period from about the sixth to the thirteenth centuries, consist of upright rectangular stone slabs, from 3ft. to 8ft. high, bearing inscriptions in Oghams, in Roman, or in Runic characters; and showing on one or both faces the figure of a cross incised or sculptured in low relief, and sometimes decorated with characteristic Celtic ornament. These fall very naturally into two classes, the Scandinavian and the earlier Celtic pieces. They are distributed around the island. There are no fewer than twenty-five places in which they have been found—generally within or near one of our ancient Christian burial grounds. They are, in fact, tombstones erected to the great ones of their day by their Christian friends and relatives. South of a line between Peel and Braddan they are, with two exceptions, purely Celtic. North of this they are more evenly distributed. By far the greatest number (twenty-six) have been found in

Maughold, which was probably one of our earliest churches, and a place of great sanctity. Next come Braddan (ten), Michael (eight), and Andreas (eight). Of the purely Celtic pieces there are two divisions—those bearing Ogham inscriptions, and those showing early forms of crosses, a few of which are decorated. The origin of Ogham characters has not yet been determined. They occur chiefly in Ireland, especially in the south-west, about 200 having been recorded. Next comes Wales with twenty; Scotland can boast about half-a-dozen; two have been found in Devonshire; and one in Cornwall. Their period is undoubtedly that of the introduction of Christianity, and some are evidently Pagan. The language is Irish of the fifth century. The characters consist of scores, arranged in four groups of from one to five cut on one or other side of, and across the arrior or corner of the stone; they read from below upwards, from left to right. We must now consider the

ORNAMENT OF THESE MONUMENTS.

The decorative designs of the early Celtic MSS. and stone monuments are arranged in rectangular panels: "absence of foliage is a characteristic, and intricacy, minuteness, and elaboration of interlaced patterns, diagonal or spiral lines, and monstrous animals and birds with long top-knots, tongues, and tails, interlacing in endless knots." Scandinavian Art, as shown in Pagan and Early Christian stone monuments, is distinctly zoomorphic, conventional dragons and serpents being favourite forms. The interlaced patterns are generally loose, irregular, and disconnected, appearing more or less accidental. In the wood-carving of Norway, rude foliage is a very conspicuous

* Extracts from a lecture delivered under the auspices of the Isle of Man Natural History and Antiquarian Society.

feature. The decoration of our Manx monuments is Celtic in the absence of foliage, and, to a certain extent, in the character of the

INTERLACED WORK.

It shows other influence in the general absence of panel arrangement, diagonal and spiral patterns, and in the character of the zoomorphism. Following in the lines of Mr. Romilly Allen's able analysis, Proc. S.A. Scot. Vol. 17 (1883); the sculpture of these Manx crosses falls under the following heads:—Geometric, zoomorphic, and pictorial. Of the geometric, we have fret, scroll, and interlacing. The chevron occurs only on the large cross at Bride, and a broken piece at Michael. The universal step is met with on eight stones, which, curiously enough, are all Scandinavian; and various forms of the key pattern or Greek fret on twelve, also Scandinavian. Of interlaced patterns, the simple twist is rarely used. A double twist of four bands, better adapted for filling a wider space, occurs on the Onon Cross, Jurby. From the twist are developed several distinct patterns. A twist with rings at each intersection, very rarely met with in pure Celtic Art, and less uncommon on Welsh crosses than elsewhere, occurs on twelve pieces, of which eleven are certainly Scandinavian. A double twist with rings, which in this case are always diamond-shaped, is to be seen on seven pieces, of which five are certainly Scandinavian. The use of this pattern elsewhere is very rare. It occurs but once in Scotland, on a cross at Drainie. The development from the twist to the tendril pattern is peculiar to the Isle of Man. We find it a favourite of the sculptor Gant Bjornson, who so proudly boasts in a Runic inscription at Michael that he "carved this and all in Man." There remains one more form of ornamentation to be considered, the pictorial. The

MANX MONUMENTS

bear figures of men, beasts, and birds, and inanimate objects; symbols; and representations of Scriptural subjects. Of the latter we have four—"The Temptation of Adam and Eve," "Daniel in the Lions' Den," and "The Crucifixion," which are of the most frequent occurrence in Ireland; and "The Virgin and Child," which is met with in Scotland next in frequency to "Daniel in the Lions' Den" and "The Crucifixion" (but only two instances of the latter are on the sculptured stones). In conclusion, I wish to impress upon you that these Manx sculptured stones are not mere copies of Irish, or of Scotch, or Welsh, or other pieces; they belong to the same Art school, the Celtic, which itself is a de-

FRAGMENT OF FIFTEENTH CENTURY CLOISTER AND ROMANESQUE WALL, MONTSERRAT.

velopment of the Lombardo-Byzantine, but they are as truly original, and show as much individuality, as much of the genius loci as the Welsh, or the Scotch, or the Irish—they are, in every sense of the word, national monuments, and should be prized as such.

A Famous Irish Cathedral.

RESTORATION AT CLONFERT.

CLONFERT CATHEDRAL, during the thirteen hundred years of its existence, has passed through many vicissitudes. It has just undergone the ordeal of restoration—at least, a scheme for preserving this ancient fane has been carried out in part. Some interesting particulars concerning the cathedral have been supplied by the rector, who, dealing with the history of the fabric, says: "Six times was it burnt between the eighth and twelfth centuries. Thrice was it plundered between the tenth and eleventh. These depredations were not all committed by the heathen Danes, who frequently sailed up the River Shannon from Limerick and attacked Clonfert, but at times by the Irish themselves. When an Irish chieftain on one side of the Shannon had a quarrel with an Irish chieftain on the other side of the Shannon, his usual mode of punishing his enemy was by crossing the river and battering down Clonfert. It is surprising that anything ancient has remained, so frequently has Clonfert been burnt, plundered, and destroyed." And, concerning the Architecture of the edifice, the rector reminds us that the cathedral is celebrated for its magnificent doorway—one of the finest specimens of

HIBERNO-ROMANESQUE ARCHITECTURE

in existence. The doorway dates from the year 1166. Mr. Brash, in his work on "Irish Ecclesiastical Architecture," gives a long description of the doorway, and concludes by saying:—"Norman porches and doorways, of course, exist of grander proportions, but not exhibiting the fertility of invention and beauty of design that this does. I had to relinquish my intention of making a drawing of it; nothing but photography could accurately represent the wonderful variety of its ornaments." The cathedral is also remarkable for its beautiful east window, nearly a thousand years old. Mr. Brash gives a drawing of the window in his book, and says:—"The design of this window is exceedingly chaste and beautiful, the mouldings simple and effective, and the workmanship superior to anything I have seen either of ancient or modern times. The mouldings are finely wrought, and the jointings of the stonework so close that I cannot believe they were ever worked by tools. The ashlar must have been rubbed on their joints to make such close work." When the Royal Society of Antiquaries of Ireland visited Clonfert some years ago, they expressed themselves enraptured with

ITS MAGNIFICENT DOORWAY.

They stood astonished when they first beheld this marvellous specimen of Hiberno-Romanesque work. One member of the Society, in speaking about the building, calls it the exquisite Cathedral of Clonfert. A Quaker gentleman, an ex-member of Parliament, writing in a magazine some time ago, says:—"It would be worth a pilgrimage into Connaught to see Clonfert doorway alone." Clonfert at one time was a city, and celebrated for its schools. It is now not even a village. In the reign of Queen Elizabeth, before Trinity College, Dublin, was founded, Clonfert was proposed as a suitable site for the University, as it was then celebrated as a seat of learning, and being in the centre of Ireland, a convenient place for Irish students, but this proposition was rejected, and Dublin obtained the charter. In the year 1175, when Roderic O'Connor, King of Ireland, carried on his negotiations with Henry II., King of England, the Abbot of Clonfert was one of the ambassadors sent by him to Windsor. "I beg to submit," concludes Canon M'Larny, the rector, "that the preservation of a church founded as far back as the year 558—connecting the present with the past, the nineteenth century with the sixth—and possessing historic interest and architectural beauty, is a work which will commend itself to the approval of all." Mr. J. T. Fuller, F.S.A., is the architect for the restoration.

Oratory N° XXVIII

SKETCHED BY F. HAMILTON JACKSON.

WESTMINSTER IMPROVEMENT.

PARLIAMENT REJECTS THE SCHEME.

PARLIAMENT has rejected the Westminster Improvement Scheme with emphasis. The motion for the second reading of the Bill—the Victoria Embankment Extension and St. John's Improvement Bill—came before the House of Commons on Wednesday of last week, when the measure was ousted by a majority of 252.

Mr. Burdett-Coutts, moving the rejection of the Bill, said it proposed to deal with a site which, from an architectural and a historic point of view, was the most valuable and interesting that remained to be dealt with in London. He claimed that where public interest came into conflict with the private interest of a syndicate, the private interest must go to the wall. The public benefits possible to the scheme were two—the making of the embankment and the making of a main thoroughfare. The promoters said they were going to complete the section of the embankment extending from the Victoria Tower Gardens, past Lambeth Bridge. He submitted that the project sacrificed such a hope for ever. The great road facing the Houses of Parliament ought to be carried straight to Lambeth Bridge, to form a junction with the rest of the embankment beyond Lambeth Bridge. That road ought to be left open on its river side; the space between it and the river should be maintained as an open space for the continuation of the Victoria Tower Garden, gradually narrowing down to the bridge. The public would then have a clear view of the river, and

THE PICTURESQUE LAMBETH SIDE,

or, if on the river, they would have an uninterrupted view of the Palace of Westminster. That was the only plan worthy of the dignity and beauty of the site, and it was the plan for which the site afforded the most obvious and natural facilities, so long as it was treated in a public, and not a money-making spirit. In place of that the scheme offered them a great block of buildings right up against Victoria Gardens, between the main road and the river, and a little narrow road for an embankment, approached by a still narrower street. Traffic passing from the south side of Lambeth Bridge along this embankment road to the front of that House would have to turn four right angles. In order to make the block of buildings as deep and as valuable as possible the Avenue was pushed back, and made to debouch into the narrow Horseferry Road,

which ran at right angles to it, at a point where it was not 40ft. wide, and where it would form a dead end to this precious Avenue. The river block of buildings was

A GLARING OBJECTION,

but it was necessary to the dividends of the syndicate. In his opinion the treatment of this great national question, so far as the immediate vicinity of the Houses of Parliament was concerned, ought to be a national affair.—Mr. T. H. Robertson seconded the amendment.—Sir J. Lubbock remarked upon the fact that both the mover and seconder of the motion for rejection had admitted that improvement was necessary, and that the buildings occupying the site proposed to be cleared were absolutely unworthy of the position they occupied in proximity to the Houses of Parliament and Westminster Abbey. Their desire was to make the district worthy of its great surroundings, and they would gladly accept from the Committee any suggestion having that object in view.—Mr. Burns thought as this was

THE FINEST SITE IN LONDON,

it ought to be occupied, if at all, by the new War Office, the new Education Department, or some other Government building. The County Council were pledged to go on with the embankment scheme, but they objected to be dictated to as to the form the extension should take. The House was asked to sanction the erection of a cheap, nasty, red-brick block of flats, or, worse still, a Continental hotel full of derelict millionaires from South Africa and South America, at the price of vandalising the approaches to the Houses of Parliament and turning 6000 people out of their houses.—The House divided: for the second reading, 84; against, 336—majority against, 252.

A MEETING of parishioners has been held at Worstead to consider the report of Sir Arthur Blomfield on the proposed restoration of the parish church. The purport of it was to divide the necessary and desirable work into two sections: (a) Structural works, needed to put the whole building into a thorough state of repair, and as far as possible to arrest the progress of decay which is now going on with ever increasing rapidity; (b) works which have for their object the permanent improvement of the interior of the building, regarded as a place of worship to be constantly used by the parishioners, not only for the regular services of the church, but for private prayer. The Vicar was empowered to apply at once to Sir A. Blomfield for his estimate for the restoration of the roof of the church, it being unanimously decided to undertake the work section by section.

CITY WORKS.

MR. D. J. ROSS, the City Engineer, has issued a report, in which he indicates the works and improvements which have been executed in the City during the past year. The business transacted by the Commissioners under the London Building Act, 1894, was extensive. The report contains a lengthy reference to a number of street improvements which have been carried out. Some idea of the magnitude of the improvement business conducted by the late Commission of Sewers may be gathered from the fact that claims amounting in the aggregate to about £241,000 were negotiated during the year. The amount these claims were settled for was about £185,500, whilst surplus lands and other property to the value of £34,175 were also disposed of. The amounts charged for water supplies were as follows:—For urinals, £1986 18s. 6d.; flushing sewers, £51 8s. 9d.; street watering, £698 3s. 11d.; washing surfaces of courts and carriageways, £961 2s. 7d.; drinking fountains, £81 14s. 10d.; and City mortuary, £7 2s. 6d.; making a total of £3786 11s. 1d.

BENEATH THE CITY STREETS, now under the control of the Corporation, there exist at the present time about 2360 yards, or nearly one and a third miles of

subway. The lengths of gas, water, and hydraulic mains, telegraph and pneumatic tubes, and electric lighting conduits laid in these subways amount to a total of 7½ miles. The electric light and telegraph conduits contain about 424 miles of wires and cables. The importance of the work of cleansing and watering the streets and removing the trade refuse within the City may be realised when it is understood that over a million people and nearly a hundred thousand carriages enter and leave the City daily, and that out of that number more than three hundred thousand persons pass the day within the City. The quantity of water used during the year for

WASHING THE STREETS AND COURTS

was about 26,329,666 gallons, the number of nights when it was used being about 261. The quantity of refuse removed during the year, according to the returns of the Superintendent of Street Cleansing, amounted to 43,725 van loads taken from premises, and 30,065 loads of sweepings off public ways, making a total of 73,790 loads, which is at the rate of 1419 per week, or about 237 per day during six days of the week, there being no removal of dust or sweeping of the thoroughfares on Sundays. The destructor apparatus at Lett's Wharf was in constant operation both day and night throughout the year, with the exception of a stoppage of 23½ days for repairs and cleaning flues.

GLASS HOUSES

A NEW DÉPARTURE IN BUILDING.

SOME few years ago Dr. Van Heyden, of Japan, experimented with hollow glass blocks, or bricks, of which he had a small house built; but this proved a failure, partly because the windows and doors were similar to those in ordinary buildings, and the glass bricks contained enclosed air, and partly because various requisites of a healthy dwelling were not provided. A primary essential of a house is light, but, generally speaking, light of a sufficient amount is accompanied in hot climates by a superfluous degree of warmth. Dr. Van Heyden used in the construction of his novel dwelling-house hollow boxes made of glass, which could be filled with a solution of alum, and made both air and watertight. These boxes, says the Health News, were made a little over a yard broad, and about 24in. high, by fixing glass panes, one-third of an inch thick, in an iron frame, and then screwing them together. The interstices between the rows of boxes were filled with felt, covered with thin boards; the flat roof permitted a similar arrangement. Dr. Van Heyden thinks that, for different reasons, the glass boxes might be of larger dimensions, the panes with which they are formed being proportionately thicker, in order the better to stand the pressure of the fluid contained in them. The boxes successfully resisted the influence of heat and cold, as well as shocks of earthquake.

NO DOORS REQUIRED.

It will be seen that a house built in this fashion, without doors or windows, is practically a large hollow box. The panes being of rough plate glass, persons outside cannot see into the interior, though light is freely admitted on every side; while people in the house can readily look out upon external objects by substituting polished glass for the rough panes at suitable positions, so as to form windows. As regards ordinary doors, they were not requisite, as Dr. Van Heyden made the entrances by a staircase and lift leading from a room sunk below the house. This room is lighted through four glass boxes let into the corners of the floor of the sunlit apartment situated above it. This floor is made of a double set of planks, with a thick layer of sawdust interposed between the two sets of planks; the upper set is painted and varnished to form the floor of the living room, while the lower, whitewashed, is a suitable ceiling for the sunken room. At night the rooms are illuminated by electric lamps, which give off heat, and do not vitiate the air as gas would do.

SOME OF THE ADVANTAGES.

Dr. Van Heyden does not forget to take into consideration that in winter the solution in the glass boxes might freeze, even in Japan, and that it would be certain to do so if such a house were built in a colder country. To provide against this contingency the whole building is surrounded by a covering of common window-glass set in wooden frames; the house is thus enveloped in air, which is a bad conductor of heat; while the air space can be readily warmed, if necessary. Ventilation is arranged for in a simple manner by carrying the iron pillars somewhat higher than the walls of the rooms, leaving a space corresponding with what is usually called the moulding. This free space opens into a groove covered with ordinary window glass, and running round part of the building; from it a tube conveys the air away from the house. One advantage derived from living in such a dwelling is of no small importance in hot climates during summer—namely, perfect freedom from mosquitoes and other tormenting insects which easily obtain an entrance into an ordinary house through the doorways and windows. Dr. Van Heyden is not so blind an enthusiast as to expect his example to be universally followed, but he has, at any rate, the satisfaction and credit of directing the attention, not only of the Japanese, but of the inhabitants of other countries, to the feasibility of using other materials in house construction than those commonly employed.

At the back
of the Church

SKETCHED BY F. HAMILTON JACKSON.

VIEWSLEY CHURCH.

BY A SPECIAL CORRESPONDENT.

THE original church at Yiewsley was a small building designed by the late Sir Gilbert Scott, and consisted of a nave and an apsidal chancel, to which had been added organ and choir vestries. Built mainly of brickwork, it was of simple design and homely proportions. For some time past the enlargement of the church has been contemplated, and the committee which was formed to carry out the project consulted Messrs. C. A. Nicholson and H. C. Corlette, of London, as to the best means of dealing with the problem before them. The scheme proposed by the architects, which has now been carried out under their superintendence, was the conversion of the old nave and chancel into a north aisle and chapel, and the addition of a large new nave and chancel on the south side of the old church. It was felt that this plan would leave the original building as nearly as possible intact, and that the new work could be planned on a scale sufficiently large to form a nucleus of still further additions, should they ever become necessary. The style of the new work is in harmony with that of the old church, but variations have been introduced into the details, and the new and old portions are left to tell their own tale.

THE NEW NAVE

25ft. wide and of suitable height, with massive arcades of Ham Hill stone, and provision has been made for a future south aisle. The windows are large with substantial stone mullions and tracing, and are glazed with leaded lights. The walls are built of brickwork and plastered internally, and the roof, which is tiled, has barrel ceiling of timber. The base of the tower, in which the organ is placed, has been built on the south side of the chancel; and at the south-west corner of the nave is a porch vaulted in brickwork, the gift of the children of the parish. Over its entrance is a figure of Our Saviour on the Cross, carved by Mr. E. Lynn Jenkins, of Chelsea, and above the east window of the chancel is a canopied stone niche, in which is placed another figure of Our Saviour, carved, and in an attitude of benediction, the work of the same sculptor. The general effect aimed at in the interior has been that of airiness and brightness. The chancel is wide and open, the passages are broad, and, while the general design is simple, a good deal of richness has been introduced into the details of some of the fittings. The ceilings are painted in bright colours, and the hangings and carpets are of soft and warm-looking materials. The general contractors of the new work have been Messrs. Fassnidge and Son, of Uxbridge, who built the old church some thirty years ago. Their work has been admirably carried out under the supervision of their able foreman, Mr. Arnold, and, besides the general works, Messrs. Fassnidge have made the walnut altar fittings. The carved oak panel over the entrance doors, a conventional "Tree of Life," is the work of Mr. H. Read, of Exeter, who also made and carved the oak and walnut altar with its Hopton stone Mensa, and who has in hand an elaborately carved oak pulpit, the gift of Mrs. E. White. The oak stalls of the old church have been adapted to the new chancel. The gas fittings are by Messrs. Hulett and Co., of High Holborn, W.C.; and the glazing is by Mr. William Smith, of Balcombe Street, N.W. With the exception of the altar cross and candlesticks, which have been designed and made by Mr. H. Wilson, of Kensington, the whole of

THE NEW DECORATIONS,

hangings, embroideries, and fittings in the church have been carried out from the designs of the architects. The bronze processional cross was made by Barkentin and Krall, of Regent Street. The painting of the nave roof has been done by Mr. A. Harper, under the superintendence and with the assistance of the architects, from their full-sized cartoons. It consists of boldly treated and widely conventionalised flower designs, painted in bright

colours on a white ground, and representing the vine, rose, passion flower, and pomegranate, and the fig and thistle when completed, between which are shields in wreaths of roses and vine leaves charged with sacred emblems, the arms of the diocese and the province, and the Royal arms. The decorations of the chancel roof, mainly executed by the architects themselves, consist of bold friezes of lilies and brambles upon the wall plate on each side, on the central portion of the ceiling appearing a representation of the firmament, with the sun, moon, and stars, the whole on a vermilion ground, and on a ribbon above the lily frieze are painted the words of the "Sanctus" from the Communion Office. The walls and roof of the old nave have been cleaned and coloured; the old chancel has been left for the present. A new heating apparatus has been satisfactorily carried out by Mr. A. Hewens, of Hayes. The cost of the whole work has been between three and four thousand pounds.

THE GREAT NILE DAM.

THE great dam which Sir Benjamin Baker and the firm of Aird are going to construct across the Nile just below the Temples of Philæ, will be the first great engineering work to be completed in the twentieth century. Its value to Egypt commercially can hardly be estimated; its effect and the dimensions of the great reservoir which it will create are difficult to realise. The colossal character of the dam will be apparent when it is stated that the flood discharge of a river a mile wide and 30ft. deep will be discharged through its sluices. At times the river will be dammed back to a height of about 66ft. above its present level, and for a distance of 144 miles above the dam—the effect will be, in fact, that of a lake 144 miles in length—as far as from London to the Bristol Channel—the quantity of water impounded will be more than 1,000,000,000 tons. At some periods of the year 900,000 tons a minute will gush

THROUGH THE DAM'S SLUICES.

The dam will be of masonry, and of sufficient height to be always above the water level. It will be built over the partially submerged chain of islands at Assouan—the First Cataract of the Nile—and a carriage road will be driven from bank to bank over its mile width. Its height above the lower level of the water will be 106 metres, and the traffic of the river will be provided for by a chain of locks, in number six or seven. In connection with the great dam and reservoir at Assouan the Nile will be dammed at two other points, namely, at Assiout, 330 miles lower down the river, and at another point still another 230 miles down, and near Cairo. These subsidiary dams will enable the stored-up water to be thrown into the existing canals at a sufficiently high level to irrigate the lands. The immediate effect of these new provisions for irrigation will be, according to Mr. Willcocks, the engineer to the Egyptian Government, to bring another 600,000 acres of land in Egypt into cultivation. But the far more important effect will be that of converting the present cultivated area of 5,000,000 acres into land of the first efficiency in crop producing qualities, and of putting certain districts and levels beyond the reach of the vicissitudes of flood and of drought. After the detail drawings of the dam at Assouan had been proceeded with, in conjunction with Sir Benjamin Baker, he was instructed to obtain

TENDERS FROM THE LEADING CONTRACTORS,

and so to arrange the charges for work done that the Egyptian Government should only have to make payments when the works were in operation, and the profits derivable therefrom were large enough to cover the annual charges. This was a novel arrangement, but the contractors and financiers responded readily to the appeal, and finally the tender of Messrs. John Aird and Co., the most favourable received, was accepted. The amount of their tender was practically identical with that of the estimates made by Sir William Garstin

and Sir Benjamin Baker. The first estimate of the cost of the dam itself at Assouan was nearly £2,000,000. In another aspect the dam at Assouan has a curious history. The site of it has only been arrived at by a process of exhaustion after considering every other possible scheme for some 600 miles of the Nile's length. When the plans were drawn up four years ago it was suggested that the height of the dam should be 118 metres instead of 106 metres; and it was believed that such a dam and reservoir would have the effect of submerging the temples on the Island of Philæ, about a mile above the dam. The recommendation of Sir Benjamin Baker that the temples should be raised did not meet with any great approval, but his observation to the effect that no other scheme would do, and no other site could be found, had more weight. Several

OTHER PLANS

had been suggested: a dam at Kalabasha, some thirty miles above Philæ; another at the Silsila Gate, fifty miles on the other side, down stream; a dam, called the Upper Level Assouan Dam, just above the temples; and, most imposing of all, the Wadi Rayyan reservoir—Wadi Rayyan being a deep depression in the desert some eighty-seven miles from Cairo, which it was proposed to flood. But, apart from the difficulties of constructing a canal from the Nile to the great 300 square mile reservoir of Wadi Rayyan, this project would only have watered Lower Egypt. The other schemes were all much more expensive, and would have presented enormously greater engineering difficulties—Silsila because of the sandstone formation of the rock, Kalabasha because of the depth and the width of the river. At Assouan, so far as strength and economy of foundations are concerned, the site leaves nothing to be desired. The rock throughout is hard, compact granite or quartz diorite, and the section of the river is so wide and shallow that the foundations can be put in dry. The under-sluices will be built over the water surface in summer and winter, and, consequently, open to annual inspection—a most important advantage where so many interests depend upon the stability and endurance of the work.

The foundation stone has been laid of the new Church of St. Oswald's, Fulham.

LINCOLN CATHEDRAL is to have a new organ fitted with an electric blowing apparatus.

The foundation stone of a new mission church at Sandford Hill, Longton, has been laid.

The foundation stone has been laid of a new Catholic church at Thornton, near Fleetwood.

Two memorial windows have been placed in St. Paul's Episcopal Church, York Place, Edinburgh. The artists of both windows are Messrs. A. Ballantine and Gardiner.

A SPECIAL vestry has been held at Liskeard to consider the plans of the proposed new tower of the parish church, as amended to meet the views of the Chancellor of the diocese, and to determine whether a fresh petition to the Chancellor for a faculty should be sent.—Mr. J. Sansom, architect, produced the plans, which, he said, were practically the same as the original design. The tower had been somewhat shortened, and instead of pinnacles there were battlements with corner turrets. He had reason to believe the plans would be accepted by the Chancellor.—Mr. S. Bone, hon. secretary, reported that the Tower Committee unanimously recommended the adoption of the new design.—Mr. C. M. Olver moved that the original design be adhered to, but there was no seconder.—After some discussion, it was resolved, on the motion of Mr. J. Bone, seconded by Mr. H. Wills, "That the report of the committee for rebuilding the tower with the provision of a choir vestry, be adopted, and the vicar and churchwardens be authorised to apply to the diocesan authorities for the necessary faculty for taking down the remaining portions of the present tower, and for the erection of a new tower according to the plans now before the vestry."—The new tower will be 80ft. high, and will cost not less than £3000.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
May 4th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slabs; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE Queen's cottage at Kew is to have a new roof put on—an act of vandalism which will quite take away its picturesque appearance, as the present old thatched roof, with its masses of ivy and creepers and delicious mossy tints, is charming. The interior will also prove uninteresting, as the quaint old bamboo furniture, Hogarth engravings, and the blue and white Wedgwood china is to be removed, and added to the already over-filled stores at Windsor Castle.

PRESIDENT MCKINLEY has just had an apartment at White House fitted up as a smoking room. It has been arranged in the Flemish style of the seventeenth century. The wood-work is of dark oak, which gains a rich tone by being waxed. The walls are panelled 7ft. high, and above the wainscoting they are hung with an olive-green damask paper surmounted by a frieze of Flemish tapestry. The ceiling is divided into panels by oaken beams, and each panel is filled in with dull gold. A Netherlandish fireplace with a hood is filled with olive-green tiles, and the "gar-niture de feu" is of wrought-iron. The antique cabinet, in which the President keeps his favourite smoking mixture, the table and chairs, are all of the same period.

THE municipal authorities at Glasgow are not only building an Art gallery which will, when completed, be one of the finest in the country, but they are constantly giving evidence of their anxiety to surround themselves with the best work they can get by the men who are to-day in the front rank. The Corporation has just commissioned Mr. Lavery, Mr. E. A. Walton, and Mr. Alexander Roche to paint three panels, and Mr. George Henry to fill a large lunette, above the platform in the banqueting-hall of the Glasgow Municipal Buildings. The artists selected are prominent representatives of the Scotch school, and are all either Academicians or Associates of the Royal Scottish Academy.

IN connection with the Royal Academy exhibition opened on Monday there is a rumour afloat that another "rejected" exhibition may be organised, this time at the Imperial Institute. The number of pictures rejected is somewhat larger this year. Want of space is no longer a polite fiction intended to cause the rejected to feel that they are not despised as well. With a mass of material sufficient in bulk to furnish forth five or six exhibitions of the Royal Academy size, the Hanging Committee must often be compelled to refuse much that they would otherwise hang. A large amount of this surplus might very profitably be immediately diverted in the direction of other exhibitions, but the fatal disability of hangers in a "rejected" show is

that, theoretically, they must necessarily hang everything. Under such a condition it is scarcely probable that an exhibition could be an artistic success. Again, the majority of artists who value their professional reputation will rather seek to conceal the fact that their works have not been favourably treated at Burlington House. To transfer their pictures to a "rejected" exhibition would in most cases do them no good, but rather harm, in the public estimation. This important factor narrows down the work sent to a "rejected" gallery to that which would not be accepted anywhere.

SIR WYKE BAYLISS's address at the British Artists, on "Art in London," comes at a very appropriate moment, and so does his apt remark that we suffer the defilement of all our buildings in order that we may have our mutton chops cooked properly. Now that our parks and gardens are putting on their spring clothing it is lamentable to see the amount of unnecessary smoke which is allowed to defile the fresh greenery. Curiously enough, the greatest offenders in this respect are the proprietors of the most recently erected buildings, where one would expect that some improvement in the system of smoke consumption would have been introduced. Two offenders single themselves out by their sins in this respect. One is the huge building at Hyde Park Court, where at any hour of the day volumes of smoke may be seen proceeding from the chimney. The other and worse case is that of a well known hotel at Kensington. It is stated that a request to the Vestry of Westminster is in course of signature amongst the frequenters of the gardens, calling upon them to do their duty, and put a stop to this nuisance.

AN extraordinary feat in church removal will soon be witnessed in London. Hidden away in the quiet recess of Great Ormond Street, Bloomsbury, is an unpretentious building externally, which in reality is one of the most beautiful Roman Catholic churches in the metropolis. The church was associated with the hospital of St. Elizabeth of Hungary, next door, founded by Cardinal Wiseman in 1856. The extension of the Hospital for Sick Children, close by, hampered the authorities of the smaller institution in a scheme of enlargement they had devised, and they accordingly agreed to sell their whole property to the other hospital, and erect a new building for themselves in St. John's Wood. This involved the demolition or removal of the Church of St. John of Jerusalem, and the question, after careful consideration by Cardinal Vaughan, was referred for final decision to the Pope, who has now authorised the church to be taken down stone by stone and re-erected beside the new hospital in the district mentioned. The beautiful altar and magnificent carving which the church contains will be transferred bodily, so that on its new site the building, externally and internally, will have exactly the same appearance as it has at present. Until its reopening in St. John's Wood, the church is now closed.

THE Architectural Association was in its merriest mood on Friday evening. Amid such decorative splendours as the Café Monico in Piccadilly Circus possesses, it held its annual soirée. A smoking concert was the order of the evening, and the occasion was clearly a very popular one. Rarely—never in fact—are the meetings of the Architectural Association so well attended, as was the case last Friday, from which fact we infer that the frivolity latent in the Profession only awaits a fitting opportunity on which to reveal itself in all its sprightliness; it is by no means a missing quantity. The Association got far beyond the problems of the Profession on Friday, thanks to the capital array of vocal talent—for the most part specially imported for the occasion. Thus it was that Architecture was very much in the background, which is not always the case when the Architectural Association takes its amusements. We recollect but two professional allusions throughout the whole evening. The first would, perhaps, shock the suscepti-

bilities of the Profession if related in cold print, though in the fervour of affairs on Friday the indelicate innuendo was received with every manifestation of cordiality. Mr. F. D. Clapham, one of the few members of the Association who appeared on the stage, had a woeful story to relate concerning "Mr. Parker's Picture," and the trouble it brought upon a candid critic. It was a story with a moral, and the moral was, "Always postpone unkind criticism of your friend's work *sine die*." Mr. Clapham, however, offers an easy solution. When a friend asks for an opinion on a picture which is rather out of drawings and the colour "gone wrong," it is kind to say that it is "fine and bold;" or, under easily-imagined and oft-recurring circumstances, it is always safe to say that a picture is "the best thing of its kind." But all this was very inconsiderate on Mr. Clapham's part; it exhumed old memories of the unhappy unhung. In spite of all, however, the occasion was a very happy one, to be copied by other societies throughout the country. The majority of the London members of the Architectural Association were present, and Mr. Hampden W. Pratt was in the chair. The artists were mainly men of repute.

BEFORE the Highgate Bench, Joseph Davis, builder, of Hornsey, has been summoned for breach of bye-laws with respect to a bath-room in a block of flats in the Wightman Road. The case on behalf of the Hornsey District Council was that after the defendant had erected some flats at Hornsey he sandwiched between the kitchen and sitting-room a bath-room which had no window opening to the external air. This was a habitable room, as there was the possibility of its being used for sleeping or other purposes. This was an entirely new point.—On behalf of the defendant, it was said the room was well ventilated. It could not be used for any other purpose than that of a bath-room. If he were to remove the partition the bath would be in the kitchen.—Mr. John Farrer, defendant's architect, said he had superintended buildings in Hornsey for twenty years, and never had a bath-room without a window before, but this was a matter of necessity.—The Bench held that this was not a habitable room, and dismissed the summons, with costs.

THE Barrow County Council, at a recent meeting, discussed a report of the Technical Instruction Committee, which stated: "Read report from Mr. H. Lord on the designs submitted for the New Technical School, and awarding the first place in the competition to the design marked 'Hematite' (No. 1), and the second place to the design marked 'Expert.'" The adoption of the report having been proposed, Mr. Cox asked whether the two plans which had been awarded first and second prizes had complied with all the conditions—even as to outline and colouring—issued by the committee? Then as to cost, was the chairman of opinion that the school could, according to the plans, be built for the stipulated sum, £9000? Mr. Townson said the assessor had stated that the conditions were impossible for anyone to thoroughly comply with. Generally, however, they were complied with. For instance, those in regard to placing a description of the building, to be erected at a cost of £9000, with 10 per cent. for architect's fee, along with the plan, were complied with. As regarding the outlining and colouring, etc., that was left to the architect, and he thought they could not do otherwise than give the prizes to those who the architect said deserved them.—Mr. Cox observed that he was prepared to say that the conditions had not been complied with in detail, and therefore he moved as an amendment to the report that so much of it as referred to the technical school plans be referred back for consideration. Mr. Cox reminded the Council that the surveyor's first estimate of £11,750—£12,750 with additional fees, costs, etc.—had to be cut down to £9000, or £10,000 with incidental expenses. In doing this, he took out from the plans that portion that was intended to be put in the basement in connection with the engineering department. But what did they find now? Architects were

vited to send in competitive plans. This as done, and he supposed each man would declare on his word of honour that he could carry the work out for £9000, with £900 or 1000 for incidentals. But, strange to say, the successful plans included in the work to be done for this £9000 that which the borough surveyor had taken out of his first estimate, because such would cost more than the amount they were prepared to give. So somebody was wrong—either Mr. Fox or the architects who went in the plans. According to the statement of the assessor, the schools could not be built according to the successful plans—which he supposed they would select—for less than £4,000. He ventured to say that in the end the sum would reach nearer £17,000 or £18,000 than £14,000.—Mr. Bell, in replying, pointed out that the assessor said the two persons named were entitled to the prizes, and he (Mr. Bell) thought it would be most unbecoming and undignified, in the face of the assessor's decision, to refer the matter back. On the question of cost, Mr. Bell pointed out that no expenditure would be incurred without the sanction of the Council.—The amendment was rejected, and the report of the committee adopted.

Two alterations will shortly be effected in the Borough which will very considerably alter the appearance of the neighbourhood. The first is the change necessitated by the improvement which is being made at the Elephant and Castle. A great portion of the block of buildings has already disappeared, and the well-known hostel itself is now completely hidden by an ugly hoarding. When the alterations are completed, the easy passage of traffic into the Walworth Road will be much facilitated. The other change imminent is that which the improvement of Long Lane and Tabard Street will involve. Tabard Street (the notorious Kent Street of earlier days) is to be widened and extended, and the narrow outlet by which Long Lane debouches to the Borough at St. George's Church will also be improved. These alterations will involve the disappearance of St. George's Churchyard, while the church itself, which projects into the Borough High Street, and is a perpetual hindrance to traffic, will be isolated, becoming an island surrounded by broad new streets. This scheme, of course, necessitates the demolition of many houses, but it is satisfactory to learn that the new thoroughfares will leave untouched the surviving portions of the old Marshalsea prison. The churchyard will disappear, but it is one of the conditions of the improvement that a new open space of equal size shall be provided in its place.

The acquisition by the London School Board of the two riverside mansions, to be used as Industrial Schools, is a step which has not found much favour with some of the London journals which have made reference to the circumstance. One of the mansions is the old residence of the Earl of Kilmorey, at Richmond, and the other is Lord Lonsdale's house at Barnes, which has been lately used by the Lyric Club. The latter especially is a building of considerable architectural pretensions, and the interior is gorgeously ornamented. The splendour of the surroundings in which they are taught their trades will tend, it is contended by the newspaper critics, to make the little waifs discontented with the comparative squalor attending the scene of their labours when the time comes for them to enter on the battle of life in the big world outside.

There is to be seen at the Imperial Institute a Queensland curiosity just received from that colony in the shape of a piece of a wooden drain pipe, which has been in use for more than fifty years. It was laid down in what is now known as George Street, Brisbane, in the times of the convicts, and is quite sound to this day. Some paving blocks are also at the Institute in the Queensland Court, which have been laid down for the past sixteen years at the junction of Queen and George Streets, Brisbane, where the traffic is very heavy. These blocks (which are only very slightly worn) and pipe were fashioned from the hard

woods of the Queensland forests, so noted for their durability and strength. There are thirty-five miles of streets in London paved with Australian hard woods, and the use of these timbers is increasing so rapidly that the supply cannot keep pace. In March, 1896, a portion of Wellington Street, Strand, was laid with blackbutt, crow's-ash, and tillow wood (all Queensland hard woods) by the Strand Vestry, who are very pleased with their bargain. A visit to the Queensland Court at the Institute will reveal the many beautiful kinds of timbers which the colony possesses for building and furniture purposes.

Those who are led to purchase French furniture, girandoles, candelabra, and clocks, imagining them to be of the time of Louis XV. or XVI., will be interested to hear that at a recent sale in Paris of the effects of the Maison Beurdelay, which occupied several days, the principal makers of old French furniture bought at high prices the models for the bronze work for which these pieces are so notable. A commode by Reissner from the Hamilton sale, which may be given as one instance, fetched 5000fr.; and even a candelabra Venus and Cupid, Louis XVI. style, reached 1500fr.; a Louis XVI. clock, after Carlin, the original at Windsor Castle, 2550fr. How was this copied?

The remarkable movement for the extension of hotel accommodation in London continues. More and bigger hotels are being erected. Even the most fashionable houses are affected, and are re-constructed, enlarged, or re-furnished, to meet the competition of their formidable modern rivals. Claridge's, the most aristocratic hotel in the world, the resort of sovereigns who visit London incognito, is even now emerging from a process of renovation. The Carlton, the new hotel which is uplifting its imposing beauty next door to Mr. Tree's handsome theatre, the new Her Majesty's on the site of the old Her Majesty's, is also approaching completion. The Carlton will have between 300 and 400 bedrooms. Its reception rooms will be smaller but more numerous than usual in the modern big hotel. How luxurious are the ideas of its promoters may be gathered from the fact that the contract for furnishing, just concluded with Messrs. Waring and Gillow, is for £150,000. Another West End development is that of the Bath Hotel, in Piccadilly, which has annexed Walsingham House, and is now completing the union of the two houses into one. There are two new hotels approaching completion, each having 500 bedrooms, namely, the big hotel in Russell Square and the Great Central, which, as its name implies, is to be the hotel for the new railway from Sheffield to London. The most ambitious project of all is for a new hotel, which is to exceed in size the biggest of the gigantic hotels on the Embankment. The site spoken of for this immense hotel is the Adelphi, and if the project be carried out the Savage Club will be one of the houses to be taken for the site.

It is stated that £10,000 has been guaranteed and subscribed towards the restoration fund of Paisley Abbey. The total aimed at for restoration is £40,000, apart from outside improvement. Dr. Rowand Anderson, who carried out the restoration of Dunblane Cathedral, has been employed as architect, and with his assistants has been conducting excavations to determine the stability of the foundations throughout the choir and the four piers which carry the central tower. These were all found to be in a most satisfactory condition. It is pointed out that there will be no disturbance of graves in the restoration operations in the choir and transepts. The churchyard books show no interments in the large majority of the lairs for fifty years or longer, and in the case of four graves disturbed within twenty years, it was shown that they would not be in the line of excavation work.

SOME exceptionally choice and valuable engravings, comprising fancy subjects, after masters of the English school, have been disposed of at Messrs. Sotheby's auction rooms

in Wellington Street, Strand. "The Daughters of Sir Thomas Frankland," after J. Hoppner, R.A., by W. Ward, fine impression with margin, sold for £97 13s.; "Mrs. Curtis," after H. Walton, beautiful proof, before the inscription space was cleared, was knocked down for £90; "Lady Rushout and Children," after D. Gardner, superb proof, first state before it was altered to an oval, published January 1st, 1778, £81; and "Lady Compton," after Sir Joshua Reynolds, by Valentine Green, old impression, inscription space cut, £80. The 184 items realised £1136 9s. 6d.

AFTER having given their attention for a year or two to ceramic art, the Burlington Fine Arts Club have this season returned to their critical studies of Italian painting. The school which has been selected is that of Lombardy. It is represented by 75 pictures, of which about 40 have never, it is stated, been exhibited before. The Committee are not entirely satisfied. They regret the absence of two very important works, which are housed in Scottish mansions—the "Solario" at Rossie Priory, and the "Sodoma" at Gosforth House. They have failed to obtain other fine examples which they applied for, yet the collection as presented is rich enough to repay much study. The place of honour is given to Solario, who has been described as the greatest colourist of the school. His picture is a beautiful representation of the Annunciation. The Virgin is kneeling at a table, robed in blue and red; behind her is a large canopied couch, hung with green curtains, on the left is the angel, seen in profile, draped in light blue and red; and through a window a landscape is seen, itself an entrancing picture, lovely in its pure colours. Luini was another of the delicate colourists of the later period, and he, too, is well represented—perhaps best in the lovely Virgin, lent by Mr. Ludwig Mond.

In the House of Commons recently, in connection with the consideration in committee of the London Building Act (1894) Amendment Bill, the adjourned debate on the question, "That it be an instruction to the Committee to take into consideration whether the offices and buildings of the Stock Exchange shall be exempted from the operations of Parts VI. and VII. of the principal Act," was resumed.—Mr. Pickersgill said that the statement that the London County Council did not object to this instruction was misleading. Neither the County Council nor its Parliamentary Committee had had the instruction under consideration. The members of the Stock Exchange desired to have their offices and buildings excepted from Parts VI. and VII. of the principal Act. The main object of Part VI. was to lay down in regard to the construction of buildings certain conditions which were for the general advantage; and to exempt the Stock Exchange would be most unfair. If the Stock Exchange had a *locus* before the Committee, they could submit their case; and, if they had not, why should the House of Commons specially interfere on their behalf? One section (75) of the principal Act might press hardly on the Stock Exchange. That body wished to make certain extensions of their premises; and section 75 prohibited buildings from exceeding certain dimensions without having party-walls. The power of exemption which was given to the London County Council was limited in a manner that would exclude the Stock Exchange; and, therefore, as a compromise, he should move to leave out from the instruction the words "Parts VI. and VII." and substitute the words "Section 75."—Mr. Brigg seconded the amendment.—Mr. Cohen said that, while it was true that the County Council had not assented to the instruction, approval had been notified by the special members of the Parliamentary Committee to whom the question had been referred by the whole committee. The Stock Exchange did not claim to be exempted from the general law by this instruction; they only asked that the Committee on the Bill might consider whether they were entitled to this exemption.—On a division the instruction was approved.

PROPOSED PREMISES Y.M.C.A. NEWCASTLE-ON-TYNE.
Design by Armstrong & Knowles Newcastle-on-Tyne

PARK LODGE, SCARBOROUGH. MESSRS. HALL, COOPER, AND DAVIS, ARCHITECTS.

At Bath County Court an action was brought by Major C. E. Davis, the city architect, against the Corporation of the City of Bath, to recover certain payments for work done by him on behalf of the Corporation. The Corporation relied on two agreements made between themselves and a Mrs. Joyce, contending that she was liable to indemnify them against the claim. The Corporation admitted Major Davis's claim, and therefore the fight was really between the Corporation and the third party; £45 was the amount of the claim, and it was for professional charges in connection with the rebuilding of a restaurant. Long negotiations took place, during which two agreements were executed, in which Mrs. Joyce agreed to pay Mr. Davis's "reasonable charges." It was upon this that the question hung.—Defendant had paid £15 15s. into court.—His Honour, in giving judgment for her beyond the money in court, with costs, allowed ten guineas for perusing plans, for which £27 was charged; five guineas for the elevation and detailed drawings, and nothing for passing works on completion.

MR. S. GOETZE has offered to paint frescoes for three panels at the back of the altar in the Church of St. Botolph, Aldersgate. The subject of the middle panel will be the "Entombment of our Lord." The wing panels will contain figures emblematical of the phrase, "Watch and Pray." Only the central painting is at present complete, so that some time must elapse before the alterations in the appearance of the east end of the church can take place.

CHANTILLY CHATEAU has been opened to the public in accordance with the terms of the bequest made to the nation by the late Duc d'Aumale. Chantilly Chateau consists of two buildings, the older and smaller of sixteenth century construction, and the new one erected after the plans of M. Doumet. Visitors are interested in the Court of Honour with Guerin's marble group to the memory of Louis Quatorze, an excellent collection of wood carvings, the artistic ironwork, &c., the books and pictures.

ARRANGEMENTS have been made for holding at the South London Art Gallery (Lord Leighton Memorial), Peckham Road, S.E., a series of special collections, of which the first, now open, is a collection of Japanese colour prints. The ordinary collection is, in a sense, "permanent," though, as the pictures shown are mostly lent, they are continually changing. It is thus quite distinct from the short loan exhibitions held in various parts of London at this time. In addition to the picture gallery, there is a museum filled with technical objects of artistic interest.

THE National Gallery in Dublin is to be enlarged. The estimated cost is about £20,000, though the Treasury have provided only £2000 for a start. The enlargement is rendered necessary in order to house the collection of pictures which has been presented to the gallery by the Countess of Milltown. The collection includes 150 pictures, some of which are very fine, there being several examples of the French school. Even without the Milltown collection, the National Gallery is far too small.

At the last meeting of the Metropolitan Asylums Board Mr. John Lobb moved, "That, having regard to the fact that the total amount paid by the Managers to architects and quantity surveyors during the four years ended at Lady Day, 1897, was £63,683 9s. 7d., the question of the appointment of an architect to the Board be referred to the General Purposes Committee for consideration and report." He remarked that he would not alarm the Managers by giving them the sum which had been spent in that direction during the last ten years. During the last four years, however, five architects had received £51,108 5s. 8d., and eight £1098 18s. The Board, he said, required the services of a good architect to advise them in committee, and he believed that if one was appointed a great saving would be effected. He did not attach

any blame to the architects who had served the Board, as it was their business to make a good bargain with a public body. He would have done the same had he been in their places, and perhaps obtained more; and he considered that the Managers had been very remiss in not dealing with so important a question earlier. Other public bodies possessed their own architect, and he failed to see why the Metropolitan Asylums Board should not have their own also. He realised, of course, that one man could not do all the work, but he could render valuable assistance in respect to tenders and the erection of buildings.—Mr. Purchase, in seconding the motion, said at one of the hospitals the architect ignored both the committee and the Board, and incurred an expenditure amounting to £38,000 without consulting either one or the other. Such a thing would have been impossible if the Managers had had an architect of their own.—The motion was lost on the Chairman's casting vote.

A STAINED-GLASS WINDOW has recently been fixed in St. James' Church, Handsworth. The window consists of three lights and tracery filled with stained and painted glass. The subjects chosen are from the family history of the home beloved by Mary, Martha and Lazarus. The principal subject is the "Raising of Lazarus." The subjects are placed under canopies of a light treatment, and the colour is confined to the background and subjects except the golden enrichment of the ornamental parts of the canopy. The robes of most of the figures are richly diapered and the drawing and colouring are admirable. The window was designed and executed by Mr. T. W. Camm, of Smethwick.

THE middle span of the temporary bridge at Vauxhall has been successfully floated into position. It was an extremely neat piece of engineering work, and was accomplished without the slightest hitch of any kind. About forty minutes before high water at Vauxhall, the centre span, which had been lying above Lambeth Bridge for some days upon a big barge-like craft, was tugged up stream until it lay like the top of the letter T at right angles to the southern arm of the bridge, and here it was kept by tugs until the fast-running flood tide ceased to flow. Then on the top of the flood it was swung broadside on to the stream and hauled and pulled until its huge bulk lay just in position between the two arms of the bridge on either side of it. Then, when it had been quickly secured in its proper position, the engineer on board the floating foundation gave the signal, and the workmen, by means of hydraulic jacks, raised it so that the beams upon which it had rested could be knocked away, and its weight should become wholly dependent upon the supports prepared for it on the completed arms of the bridge. It was all done in ten minutes, and twenty minutes after high water the span was resting in position and the ferry boat which had supported it was being floated away on the ebb.

THE Council of the Church House are appealing for funds towards the erection of the second section of the building. The great hall is finished and in use. Suitable accommodation has been provided for the meetings of the Houses of Convocation. Larger and better rooms will hereafter be erected, in accordance with the original scheme. On the west side of the permanent building the chief room will be the permanent meeting place of the House of Laymen. This room will be capable of seating about 300 people. In addition to this the west side will contain nineteen rooms, to be used for letting as offices to church societies. The cost of the erection of this west side is estimated at £18,000.

THE Corporation of the City of London is still waiting to know if the Government will give its consent to the rebuilding of the present Old Bailey Sessions House. The Sessions House is a structure standing quite apart from Newgate Prison, which in a general way is understood to have been transferred from the jurisdiction of the Corporation to that of the

Crown by the Prisons Act of 1877. The presumption is that the Corporation requires the Newgate Street end of the prison on which to rebuild, and hence the consent of the Government has to be obtained. What shape the proposed new building will take, and whether all or part of the prison will disappear to make room for it, cannot just now be stated, for at present only a sketch plan of it has been prepared. The consideration of the matter concerning which the City Lands Committee approached the Home Secretary is, it seems, as a matter of form, within the province of the Prisons or Criminal Department of the Home Office.

THE building known as Abbey Mansions, in Orchard Street, Westminster, a portion of which was wrecked recently by the falling in of the concrete roof, was erected for Her Majesty's Office of Works, by whom it had been leased for twenty-one years for use by the Civil Service Commission as offices. It is a building of nine floors and about 300 rooms, and was erected by Mr. W. R. Rickard, contractor, of City Road, at a cost of £95,000, from the designs of Mr. C. J. C. Pawley, architect, of 2, Princes Mansions, Victoria Street. There were, however, a number of sub-contractors. Quite recently that portion of the building which has collapsed was certified by the district surveyor as "completed" for rating purposes. The construction of this portion had been delayed owing to a question of ancient lights raised by the owners of the Catholic Apostolic Church in the rear, and it is said that the work had been somewhat hurried in consequence.

At a sitting of the Norwich Consistory Court, Mr. J. Overbury applied, on behalf of the vicar of Ilketshall and the churchwardens, for a faculty to completely restore the church by rebuilding the roof, raising the walls, building new buttresses, restoring the windows, replacing the floor, erecting an oak screen, repairing the tower, and carrying out other alterations and improvements at a total cost of £1351.—The Chancellor said he would consider the matter in Chambers.—Mr. Overbury also applied for a faculty on behalf of the vicar of St. Mary's, Framden, and the churchwardens, to erect a lych gate at a cost of £25, to re-roof the nave of the church, remove two misereres from their present position in the nave to within the altar rails, remove the reading desk from beneath the pulpit to the south side of the chancel rail, strip the chancel roof of the false plaster ceiling, expose the wood roof and re-board same, and relay the brick floor of the chancel.—The Chancellor thought it a pity to remove the misereres from their original position, but he supposed those who were on the spot, and had seen the place, knew best. After all, it was a matter of taste. He would deal with the application in Chambers.—The rector of Trinity St. Martin applied for a faculty to remove the old font, erect a new roof of pitch pine, remove a lath and plaster ceiling, remove a deal chancel arch (painted in imitation of marble), and make a new doorway in the tower as a main entrance. The cost would be £340. The chancel arch was erected about eight years ago by the parish carpenter, and was hideous in design and colour.—Citation was issued.

At St. Alban's English Church, Copenhagen the stained glass window subscribed for by British residents in Denmark as a memorial of the sixty years' reign of Queen Victoria has been unveiled. The subject of the window is "The Home in Bethany." The royal monogram is introduced in the cinquefoil, and the royal arms, with the dates 1837 and 1897, are inscribed on scrolls at the foot of the window. Another memorial window, filled with stained glass, was unveiled at the same time. The subject of this window is "Bearing the Cross." A small balance remaining after paying the expenses of the Jubilee window has been utilised for placing a second coloured window in the church porch. The three windows have been designed and executed by Messrs. Heato Butler, and Bayne, of London, under the supervision of Sir Arthur Blomfield, the architect of the church.

Surveying & Sanitary SUPPLEMENT.

MAY 4TH, 1898.

MASONRY.

By JAMES WILDING.

III.—THE SKEW ARCH.

ONE of the most interesting problems in masonry is the development of the face lines of the soffit and extradosal coverings of arches over skew and circular plans.

The example treated here is a skew arch, that is, an arch in this case semi-circular in cross section, supporting a road which is at an acute angle with the going of the arch. As the method used for the unrolling of the soffit is one which applies generally, a special figure is given, Fig. A, to prevent any confusion arising when the more intricate Figs. 1, 2, 3, and 4 are being referred to.

DEVELOPMENT OF THE SOFFIT OF THE SKEW ARCH.—With K I as centre, describe the semi-circle—divide the soffit into six equal parts; any number of parts may be used; the small number is used in this case for convenience, lettered B C D E F G. Produce A K I G indefinitely; under the elevation or the arch place the plan, inclined at 30deg. to A K I C. Drop the divisions A B C D E F G to touch the line K G at the points 0, 1, 2, 3, 4, 5, and the line M G I at 7, 8, 9, 10, 11, 12; these lines are parallel to the line K M. From G, towards the right hand, mark off F E D C B A equal in length to the six divisions into which the soffit of the arch is set off; drop lines from these points square to A K I C:

From K C draw O, A H parallel to line A K I A;
From 1 draw 1, B H parallel to A K I A;
From 2 draw 2, C H parallel to A K I A;
From 3 draw 3, D H parallel to A K I A;
From 4 draw 4, E H parallel to A K I A;
From 5 draw 5, F H parallel to A K I A;

Through the points obtained by these operations trace the line marked "Face Line of Soffit." By inspection of the figure it will be seen that the lower face line of soffit on the development is obtained in a similar manner. If the line G H G I is used as a hinge line, then the soffit development would turn over to the left, and come plumb over the lines K G H and M G I if held in a semi-circular form.

FIG. 1. Draw a semi-circle, underneath this place the plan of the required skew arch, in this case the angle of skew is 30deg.

On line K N draw the true elevation of the arch, which is an ellipse. Develop the soffit as illustrated. Draw line H X, and divide it into seven equal parts, square these points to touch the bottom line R R. This gives the plan of soffit. To find the point that all the joints radiate from (this is called the Focal Eccentricity, and was discovered and described first by Mr. Buck) draw a line from the centre used to describe the semi-circle to the outside thickness of the arch, to the point lettered P parallel to angle of skew. From the right-hand side of the arch draw a line parallel to the line 14, 15 on the soffit; from P set up a line square to P 5 and the point Q, where it touches the line drawn parallel to the soffit lines, gives the distance (P Q) of this point below the level line, from which all joints have been found by practice to radiate.

Divide the soffit of the ellipse (see opera-

tion 2) into the seven equal parts, into which you have divided the soffit. Draw all these as joints, using point P as centre, P being the distance, P Q below the level line K N before described. To find the amount of cambre in the line R S T—this must have a hollow in it to fit the centre. The method of finding this amount of cambre is as follows: Take point R up the semi-circle—this point R is same

THE TWISTING RULE is found by drawing the joint line R from P; this gives the angle at one end of the course. From examination of the soffit plan it will be seen that the other end of the bed line starts from the level—the angle at R is the one required to obtain the amount of wind, or twist in each full bed.

TO FIND THE ANGLE BETWEEN THE COURSING SPIRAL AND THE FACE LINE (better known as

vertical height as O S in the elliptical elevation on K N—from R to T draw a chord line, the amount of cambre is shown at S. Now transfer this amount of rise to the line marked template for soffit on plan; having any three points in a curve it is a simple matter to draw the amount of cambre.

that between the face line and the bed line).—The method chosen to explain the two joints that are given as examples is one which enables students to understand the relationship between lines named.

Take the joint line in the True Elevation that is lettered E F; from K N square F to O

connect OZ and the plan of the line YZ is obtained—YZ being the real length of the spiral or bed line RZ. To find the height of the point Y set up a line from O at right angles to OZ, with O as centre and OF as radius, cut off OY equal to OF—connect YZ and the full length referred to is obtained. Produce EF both ways, first to touch the line KN, secondly to A. From the point where it touches KN draw a dotted line through Z, let it be indefinite in length. Produce line KN, and from the point O set off OB equal in length to OZ, from Z draw ZC at right angles to OZ, from B draw BJ at right angles to OB, through this point draw DC square to the line marked *Direction of Ordinate*, from the point O draw the *Ordinate*, parallel to the line marked *direction of ordinate*—continue it indefinitely for the present. From B draw BA1B1 at right angles to DC, from B but square to OB draw AB to meet joint line EF, make A1B1 to equal AB, draw DB1, erect OM B1 2, at right angles to DB1 make ordinate O1M1 equal to ordinate OM, with D

FIG. 5.

as centre, and DZ as radius make D1Z1 equal to DZ, make X1Z1 equal to X2 in plan, connect Z1, M1, and Z1. This gives the required angle between the bed and face lines indicated in Fig. 3.

THE ANGLE BETWEEN THE LEVEL FACE LINE AND THE BED ZR is found by the same method. A careful examination of Fig. 4 will clear any difficulty the student may find.

One great advantage of this method is that the angle obtained on a small scale drawing no larger than the scale figured as the one to which the example should be drawn, may be produced each way until it is large enough for the full-sized mould. Another advantage is, that the angles obtained for one half of the true elevation will work for the corresponding half of the other face, and also by producing the line ZMI the angle for the reverse hand is obtained.

From the elevated site on which Dunninald Castle, Montrose, stands, difficulty has long been experienced in getting an abundant supply of pure water. Some time ago, however, the proprietor, Captain Stansfeld, commissioned the hydraulic engineer, Mr. A. G. Elmslie, Aberdeen, and Mr. Alexander Taylor, plumber, Montrose, to prepare a scheme to supply that want. That scheme has now been completed. The main feature of it is a double-action hydraulic ram supplied by Mr. Elmslie. The power necessary to drive the ram is got from a small stream which forms the march between the estates of Rossie and Dunninald. By utilising that stream at a fall of 13½ ft. on to the ram it lifts close on 3000 gallons per day of pure spring water to a height of 125 ft. above itself at a distance of 1000 yards. On excavating about 100 yards from the ram an ample supply of pure spring water was found, and hence the necessity of lifting it with a double-action machine. The scheme is stated to have proved a perfect success. The necessary works have been carried out by the contractor, Mr. Alexander Taylor, under the superintendence of Mr. Elmslie.

Artesian Bored Tube Wells.*

By MAURICE OCKENDEN, JUN.

(Continued from page xlvii.)

THE first well bored in Alabama, under the washout or hydraulic system, was through 22 various sand strata, mostly running sand, besides layers of clay, and the depth reached was 426 ft., with the same size hole as started, viz., 4 in., water flowing at the surface. This well could not have been bored by the English system without diminishing the size of the hole several times. In this process the main working feature is that, as the tool works, the débris is washed away from the tool, and in cases of sand and soft clays, the hole is almost made with the water pressure. The water is pumped by a force pump (usually of the Worthington type), and forced up into the derrick through the standpipe. This standpipe is fitted with stuffing boxes, through which works a specially turned tube with a few perforations in the centre. Water passing under pressure through the standpipe into the perforated tube down into the borehole through the small outlets each side of the tool, all débris is brought to the surface, as the work proceeds. Tubes are required instead of bars which are of very stout quality. This system

REDUCES THE CONSTANT CLEARING OUT

and shifting of the tools, as only a chisel is required, usually a tee chisel, which requires occasional dressing out by the foreman to keep the size of the hole uniform. At a boring just completed at Crawley, Sussex (as a pioneer hole), a depth of 650 ft. has been reached, through 585 ft. of Wealden clay, which is a very hard substance to penetrate by English bars. Water rises to a level of 6 ft. above the surface. For small works this system is considered expensive, as the time getting underweigh and the carriage of plant is heavy, compared with the English bar plant, for depths up to, say, 250 ft., provided the strata is favourable. At first it might be supposed that this system required a large quantity of water for manipulation, but this is not so, as, by the use of settling tanks, the same water is used again and again. For wells 300 ft. or over, and in southern and midland counties, this system is adopted with good results. The Canadian or American rope drilling system is called the oil-well rig, and is practically the most efficient for large holes in varied or hard rock strata to any depth, also for small diameter holes if over 1000 ft. In the oil fields of Pennsylvania this system is the only method employed, and it is easy to count 100 derricks, or "rigs," as one glances across the hills around Bradford and vicinity. The first oil well drilled was near Titusville, Pennsylvania, in 1859, by Colonel E. L. Drake, the used was 34 ft. high, while the modern is about 80 ft. The leading feature of this process is the employment of a short string of bars, usually about 30 ft. long, carrying a massive chisel. These are suspended by a rope running off derrick and the walking beam. The walking beam, which is worked off a crank, vibrates up and down, giving about thirty strokes per minute (saving the surging of rope, as in the other systems). The derrick is built sufficiently high to swing the string of tools without disconnecting, so that the sand pump can be inserted and withdrawn from the bore-hole without interfering with the boring tool. This is a great saving of time, and being only rope instead of bars or pipe, the tools and débris are quickly brought to the surface. This system is made

IN PORTABLE FORM

for convenience in crossing country where railway connection is not good. This makes a useful machine for prospecting. In the Colonies these machines in portable and traction form are much used. The Diamond system is the most costly, but the most rapid. As a true core or section of the strata passed through is obtained, it is particularly suitable

for prospecting for minerals. It consists of a series of tubes with a diamond cutting trepan head, which is revolved inside of the lining tube, and copiously supplied with water. One great drawback besides the very great cost of tools and working tubes is the quantity of water which is used and wasted in keeping the diamonds clear from débris. The method that is much used in France, Saxony, and other parts of the Continent, is that known as the "Mouton," or ram, especially for penetrating rocks. In Mr. Hughes's "Treatise on Waterworks" it describes the system thus:—"A cylinder of cast-iron, commonly about 8 in. in diameter, and 39 in. in length, weighing from one to three cwt. The upper part of the cylinder is hollowed in a conical form, and the sides are fluted so as to allow the broken débris of the rock to pass up and lodge in the hollow, conical top. The mouton is attached to the rope by means of wrought-iron handles, which are double, in case one should break. The lower part of the mouton is prepared to receive a number of blunt-pointed steel chisels, which are firmly secured to it. There are several ways of giving motion to the rope which works the mouton. One of these is by means of a long plank, placed obliquely about 12 ft. or 15 ft. above the borehole. The mouton is suspended 15 in. or 20 in. from the bottom, and is made to fall through a height of 2 ft. to 3 ft. about twenty-five to thirty times in a minute. The dust or powder resulting from the cutting action of the steel chisels would soon, if not moistened, impede the action of the tool by deadening the blows. It therefore necessitates

THE PROVISION OF WATER,

and then the sort of liquid mud thus formed rises and spouts up through the fluted openings in the mouton, and enters the hollow cone at the top. When it is observed by the workman at the surface that the tool has gone down sufficiently to fill the cone, the mouton is withdrawn, and is then found to be filled commonly with a hard, conical mass, the result of several hours' working." The Chinese are said to have bored successfully with the mouton alone to a depth of 1800 ft. For solid strata throughout this is possible, but if sand, wet clay, and such-like material as requires tubing exists, the mouton is not applicable alone, and is replaced by what the French call "emporte piece," or shell pump, as it is now designated in England. The advantages of an artesian or bored tube well are well known, and since the recent outbreaks of typhoid fever at Worthing, Maidstone, &c., the public have been brought to consider these advantages. Of course, the purity of water from a tube well cannot be guaranteed, any more than the supply from a dug well; but this is certain: water that is obtained from a tube well is free from any possible atmospheric influence, surface drainage, or leakage from cesspits close by, and shutting off supplies of water as the work proceeds, if not considered to be satisfactory. The temperature of water is more even at all seasons; but this is affected by the depth and the stratum from which the water is obtained. In regard to this matter it is very difficult to say with any accuracy

AT WHAT TEMPERATURE THE WATER WILL COME.

For wells up to 600 ft. it is stated to be 52° or 53° Fahrenheit, and increasing about 1° for every 65 ft. after a certain depth. The water in the artesian well at Grenelle, France, which is 1794 ft. deep, has a temperature of 82° or 82½° (according to Sir John Robinson). The heat of the water is undoubtedly influenced by the strata, as the mines in North Wales, although about the same depth as those in Cornwall, are much colder. In cases where running sand yields a good supply of water, if the sand can be kept back, a special brass strainer (which is milled from the inside) leaving the smallest possible opening of the slot on the outside can be inserted below the lining tubes, according to the depth of the sand and water-bearing stratum. This does away with the expense of further boring, or of digging a well deep enough to allow the water to flow up through the borehole into the dug well by gravitation, and then pumping

* A paper read before the Civil and Mechanical Engineers' Society.

from the supply in the dug well. Pumping machinery and pumps vary so much that it is difficult to select a few for this paper. Where water will not rise to within pumping distance from the surface, it is necessary to insert a pump cylinder, which is connected up with gearing and driven by power. Gas and oil engines are used very much now for pumping. For factories and institutions where steam is used a direct-acting steam head can be applied.

WELLS IN LONDON: AT TRAFALGAR SQUARE.

The site of this well is 37½ft. above sea level. The well is 384ft. deep, and consists of an open shaft sunk to depth of 148ft., with a borehole in the bottom 236ft. in depth, making total of 384ft. below the ground surface. The following strata were penetrated:—

Depth from Surface.		Thickness, Feet.
15	Made Earth	15
31	Sand and Gravel	16
169	London Clay	138
197	Mottled Clay	28
207	Sand and Gravel	10
241	Green Sand	34
384	Chalk	143
Total		384

The water now stands about 108ft. below the surface of the ground, and according to Mr. Beardmore, yields 65 cubic feet per minute or more than 580,000 gallons in twenty-four hours.

WELL AT THE BANK OF ENGLAND.

The borehole here reaches to 307ft. below the surface of the ground, the depth of the shaft being 207ft. The water on January 1st, 1852, stood at 61ft. below Trinity high water mark, and on January 1st, 1869, at 74ft., showing the diminution of the water level equal to 13ft. during the seventeen years. In January of each year the water usually stands 10ft. higher than in August, when the level is lower than any other part of the year.

WELL AT CRYSTAL PALACE.

This well is 8½ft. in diameter, and is sunk to a depth of 245ft. At this depth a boring was commenced, fitted with pipes 15in. diameter, 1ft. to 50ft. in length. These were commenced at 4ft. in height, but considerably increased as the work proceeded. At a depth of 259ft. the boring passed through a bed of sand between beds of plastic clay, and from this sand the water rose in the well to a height of 142ft., and filled the headings in eight hours. The boring was continued through the lower tertiary sands till it reached the chalk at 307ft. in depth, and had penetrated the chalk 10ft., thus reaching a depth of 550ft. below the surface. It must be observed that the supply of water in this well is derived from the sand spring at 259ft., and very little addition to this was gained by the deep boring to the chalk. The well was sunk in 1853-5, and no accumulation of sand took place until the year, when it was necessary to take out about 25 cubic yards, leaving still some accumulation which will require early removal. An account was dated 1872. In any system it is always necessary to provide a few buckets or fishing tools in case of breakage of tubes, tools, ropes, bars, &c., but as to the description of same, this depends upon the nature, depth, &c., and nearly every break requires a tool of special construction.

tion. Firing by electricity breaks up the strata to allow a free access for the water. In blasting the oil wells of Pennsylvania it is called firing a torpedo. A cartridge of dynamite, with a detonator, is let down with a light cord to the bottom, and a small monkey, or, as they call it, a "go-devil," is allowed to fall from the mouth of the borehole, which, striking the detonator, produces the required explosion.

Surveying and Sanitary Notes.

A DEPUTATION, consisting of delegates from the riparian parishes on each bank of the Thames, between Richmond and Battersea, has waited upon the Middlesex County Council at the Guildhall, Westminster, to lay before that body a scheme for the erection of a new lock with sluices below Putney Bridge. The scheme was originally drawn up by the Hammersmith Vestry in 1894, and for the last three years has been under the consideration of the local authorities. All these bodies are now practically agreed as to the details, which provide for the erection of a bridge, four locks, and sluices across the river, at a point slightly above the Belmont Candle and Soap Works, between Wandsworth and Battersea Bridges. The scheme, it is said, could be carried out for £220,000. It would have the advantage of providing a direct means of communication between Fulham and Battersea, in addition to the improvement to the water above Wandsworth Bridge.

THE Admiralty has informed the Corporation of Plymouth that in their opinion the scheme for the improvement of Cattewater Harbour, for which the Corporation are seeking Parliamentary powers this Session, would prove prejudicial to the all-important naval interests of the port. As the naval establishment is being greatly enlarged at a vast expense, and the naval traffic of the Sound in future will be proportionately increased, the only condition on which the Admiralty will consent to the scheme is the removal of the Winter shoal—a patch of rock on the eastward side of Drake's Island, and conditionally also on the removal of the Mallard shoal, which is near the entrance to the Cattewater. As the cost of blasting and dredging away the Winter shoal would be from £190,000 to £200,000, it is probable that this condition will be fatal to the scheme. The Corporation were desirous of deepening the harbour and constructing quays for ocean liners and other large vessels.

A PUMPING mill, driven by wind, has just been erected at Winesham, to obtain a supply of water for the house and premises at the Red House Farm. The wheel is erected on a 30ft. angle steel tower, built on the Eiffel Tower system. It is 12ft. in diameter, and drives a 2½in. pump, which has to force the water 300 yards, with a rise of 50ft. from the spring. The spring is covered in, and finds an abundant supply. This mill is claimed to be the best yet invented, in that it will work when all others are standing still. The wheel is of one piece, instead of the usual moveable vanes, and is made of galvanised steel, with eighteen concave vanes, and is governed by the tail, which acts automatically in the wind,

and turns parallel to the wheel in high winds, thus showing a minimum surface to exposure; and, by moving a weight up or down, less or more power can be obtained as required. It is found capable of raising 3500 gallons in twenty-four hours in a fair wind.

THE Taunton Town Council has adopted the report of the Main Drainage Committee, who had arranged terms with Messrs. Cameron and Co., of Exeter, for the preparation of plans and estimates to lay before the Local Government Board, and for superintending the carrying out of the necessary works for adapting the present sewage works to the septic system, should the Local Government Board give consent to the raising of the money required for that purpose.

A LARGE reservoir is on the point of construction at Staines, and will form an important factor in the water supply of London. The enterprise is a joint one, and it is being made for the West Middlesex, Grand Junction, and the New River companies. The reservoir will cost £1,000,000 to build, and, when finished, will have a capacity of 3,300,000,000 gallons of water daily. Messrs. J. Aird are the contractors. The idea of this immense reservoir is to store water whilst it is in a bright condition, and preserve it for distribution over the metropolitan area when the river is in flood.

THE delay in announcing the composition of the Sewage Commission, of which Lord Idlesleigh has accepted the chairmanship, is due, says the Times, to the fact that the Government have agreed, in response to urgent representations from North of the Tweed, to add a Scotchman to the list to be submitted for Her Majesty's approval. According to present arrangements there will be seven Commissioners besides the Chairman—two Local Government Board officials, two gentlemen with experience of the methods and necessities of large urban districts, an eminent bacteriologist, a well-known chemist, and a representative of Scotland.

IN the Court of Appeal recently the case of the Somersetshire Drainage Commissioners v. the Corporation of Bridgwater was heard. It was an appeal by the defendants from a decision of Mr. Justice Romer's. The plaintiffs claimed an injunction restraining the defendants from opening any new drain into any drainage works of the plaintiffs or causing or allowing any filthy or unwholesome water to flow into any watercourse within the plaintiffs' jurisdiction, and from cutting away or otherwise interfering with the east bank of the river Parrett so as to weaken the bank of the river. The plaintiffs objected to the construction by the defendants of an outlet with manholes in the bank of the river for a new drain above the town bridge carrying untreated house sewage into the river. Mr. Justice Romer had held that the plaintiffs were entitled to an injunction restraining the defendants from completing the present works and cutting through the bank of the river at the point in question without the leave of the plaintiffs, and also from conveying house sewage containing foul or noxious matter into the river by any such works or cutting, and that the defendants must pay the costs of the action. The Court of Appeal Judge now said he was not satisfied that the defendants' works had substantially weakened the bank of the river, or caused any damage to the plaintiffs, so as to call for any judgment on that ground after the arguments on appeal.

ELIZABETHAN STRAPWORK FRIEZE. MANUFACTURED BY THE ANAGLYPTA CO. LTD.

COTTON WASTE:

SOME CHEMICALS AND A DECORATION.

(With Apologies to "John Oliver Hobbs.")

ONE hears often enough that the time has gone by for the invention of a new article, and that the proper direction in which to seek for fame and fortune is the useful employment of the waste products of our modern life in its highly complex system. This may be true, and certainly ever since the use of the waste products of gas manufacture began to give such encouragement to the careful chemist and manufacturer, the world has gone on seeking for similar openings for its waste generally.

Quite recently (writes a correspondent) I saw the process by which the apparently useless cotton waste becomes a highly decorative and artistic material.

I suppose I scarcely need say that it was in Lancashire that the demonstration was afforded me. Perhaps the modern schoolboy is kept so busy in the gathering of knowledge about South Africa, China, and other remote parts of the earth's surface, that he may possibly be unprepared to answer straight off as to where Darwen is. But any visitor to the tremendous maze known as Victoria Station, Manchester, may soon ascertain where the Darwen train starts from, and then, after a climb for about three-quarters of an hour or so, he may reach the town where there are to be seen the tallest chimneys in the county of tall chimneys. A ride in a steam tram or a walk of some twenty

minutes, more or less, lands one at the corner of a narrow lane, which has a somewhat less obtrusively urban appearance than the rest of the neighbourhood, and just in a little hollow on the right is the substantial mill of the Anaglypta Company. Here, a few weeks ago, I placed myself under kind and courteous guidance, and saw the transformation of cotton waste into the handsome and effective decoration known everywhere as Anaglypta.

The lowest story of the mill is where the revelation begins, and here there is a tremendous boiler into which the waste is turned, with soda for company, and any quantity of steam as a solvent. There is no deception. You see the boiler, and then upstairs you see the waste going in. After a washing and purifying stage, the waste becomes pulp, and then the machine for rolling the pulp takes charge of the transformed material. Passing between a succession of rollers, on one of which is the design it is intended to receive, the pulp disappears into a drying apparatus, and then, after a long journey, it emerges, stiff, dry, hard, and ready for the treatment of the decorator's paint brush. The colour is a sort of cream shade, imparted to it by the sizing it receives on its way through the mill. Here lies one of its great advantages. White it would be if it were unsized, but the amount of paint it would in that case require before it could be considered fit for decoration would be about three times as much as it is necessary to use for the sized material. An infinite number of designs is to be seen in the colouring rooms, for the Company prepares a good many of the decorations to the last stage, and leaves the decorator only the work of fixing them.

Two things strike the visitor in this part of the works very forcibly. One is the roominess of the sheds in which the colouring is done, and the other the splendid light provided. If the daylight fails—and we all know that this accident does sometimes happen, even in Lancashire—there is the electric light in abundance to fall back upon.

But there are the panels to consider. These are not surely made in rolls of pulp, with their high relief, and such sharp outlines as we are familiar with in their apparently endless variety of design? Not exactly. These panels are subjected to pressure such as would have delighted the inventors of that mediæval form of torture known as the *piene fort et dure*. A powerful hydraulic ram gives the pulp a squeeze of several tons per square inch, and the moisture is all but entirely driven out, and the design left unalterably impressed upon the material; the new panel is set to finally dry upon a travelling platform which is itself a marvel of machinery, and the thing is done. Meanwhile, in another part of the mill the artists are at work engraving upon brass cylinders every kind of design likely to catch the eye and suit the taste of a cultivated age.

I saw some tiles, or at least I thought I saw tiles, but my guide remarked that here were some tile designs, and what I thought tiles was revealed as an Anaglypt. And so in all sorts of forms, with every resource of adaptiveness, the erstwhile waste was being sent forth into the world as a useful, elegant, healthy, cheerful decorative material. Truly a transformation of which any man might well be proud, and well worthy of the resourcefulness of an age of enterprise and of an art-loving generation.

GALLEY FRIEZE. MANUFACTURED BY THE ANAGLYPTA CO. LTD.

THE ECONOMY AND MORALITY OF COMPETITIONS.

DISCUSSING the paper on the above subject, read by Mr. H. B. Creswell at a meeting of the Architectural Association, and a summary of which appeared in our last issue, Mr. Aston Webb said the question of competitions in the Profession was really a serious and important one. The practice was at present in vogue, and, as Mr. Creswell had remarked, they all thought that "something should be done." It was impossible to ascertain what the cost of competitions had been, and although, no doubt, it was very heavy, and was a grievous burden to the Profession, still, after all, the great question was—What were they going to do to reduce the burden? He thought the lecturer hardly laid sufficient stress upon what had already been done. The memorial prepared by Mr. Cole Adams had a definite object in view, which was at that time to insure that architects would say "I won't compete unless an assessor is appointed." A

all bad. With due limits it was an opportunity for young men to make a name, earlier than they otherwise would do. One naturally considered what was

THE EFFECT OF COMPETITIONS

upon Architecture, architects, and the public generally? With regard to the effect upon Architecture, a system which had produced such buildings as the Houses of Parliament and St. George's Hall, Liverpool, could not be said altogether to have done badly. There were many modern buildings which he ventured to think—it would be invidious to mention them for fear of omitting others—through the competitions had distinctly advanced the Art of Architecture in England. Undoubtedly the planning and arrangement of public buildings had been greatly advanced by competitions and by the publication of designs. But many were the evils in addition. As to the effect upon architects the system did imbue in the young man the gambling spirit. It might open visions before him which took him away from his general work

difficulty of selecting from these they suggested that five or six should be asked to have a competition. That was one way out of the difficulty, and he was not sure whether in small towns they would get a better building from any of the relations than from the competition. They must remember, too, that at present all architects charged exactly the same fees. The youngest architect and the most experienced architect charged 5 per cent. It was always a wonder to him that young men got the work to do at all; he wondered people did not go direct to the best men. It was a matter for regret that, with increased experience, architects had not increased their fees; but that was not the case, and so young men, when starting, had extreme difficulty in getting work at all, especially any important public work. Consequently they entered for competitions. There was a certain amount of pleasure in preparing a large scheme, for when a young man commenced business he was naturally confined to small work, and to have a definite scheme to prepare, where there was scope for his powers,

LOUIS XV. FRIEZE. MANUFACTURED BY THE ANAGLYPTA CO. LTD.

large number agreed not to compete, and actually carried out their agreement. In that respect

A VERY GREAT IMPROVEMENT

had resulted, and now an assessor was a generally recognised institution for competitions. Where it was not so, architects should still decline to compete. Or if they had not confidence in the assessor, or were not satisfied with the conditions, remedy laid in their own hands, by again declining to compete. Architects could not be too careful in that respect—to satisfy themselves that the conditions were fair and that the assessor appointed was a man of knowledge and with backbone to see that his decision was carried out by the committee. His experience of committees was that they owed a great deal more through a lack of knowledge than to a lack of fairness. They really did not understand the work, and if the matter was laid fairly and squarely before them by an assessor, they would be inclined to accept the principles laid down. He was not there to defend the system of competitions. He knew as well as anybody the great harm they did to many men, but at the same time he could not say the system was

and injured him. At the start a young man generally had a good many hours upon his hands, and those hours were not counted as golden guineas, and should not be put down as such. He did not think the cost and labour was excessive. For an assessor to arrive at a decision a sketch plan was really all that was required, with a certain amount of detail to show the Architecture. The custom of furnishing full plans was dying out, and therefore the labour now was much less. He never knew of a case where the clerks had been offered twice or more their salaries if the firm won the competition, as mentioned by Mr. Creswell. He had known them pay only the usual rates. With regard to

THE EFFECT UPON THE PUBLIC

generally, this much could be said: competitions were nearly always for public works. It would be very sad if private work, such as building a big house, was put up for competition. When a public work was proposed there was the question of selecting an architect. One or two of the authority had a relative or friend whom they would like to introduce, and the result was four or five architects' names were mentioned, and in the

was an opportunity not to be laughed at. The remedy in regard to competitions was in their own hands—to be more careful as to the conditions, and not object afterwards, but before. If the objection at the commencement of the competition was not satisfactorily met, then they should abstain from competing. It might seem a little hard, but it would greatly strengthen the hands of the Institute in trying to introduce a better system, and the more particular they were, the less number of competitions there would be, and the competitions on a large scale would be more fairly decided than previously. The system of competition was not so much in favour with the public as formerly, and there was never a better time than now for concerted action and unity to see that the conditions should be fairly and properly laid down. The great power they had was by abstaining if they were not so:—Mr. E. W. Mountford thought the lecturer had overstated the cost of and the harm of competitions to younger men. It was well known that when quite young in the Profession their time was not so fully occupied as they might wish. When a man commenced to practise as an architect, and went to his office and sat for

many weeks without any money coming near him, he thought that man would have been doing better by trying in some competition. If a man could get enough money without competitions, then, by all means, he should save them alone.

A GREAT POINT

As that 99 per cent. of young men, when they got work, found it was of a very small kind, and to a man of any ambition whatever it was a great treat to be able to work out a design for a large building, even if he knew he had no chance of carrying out the building. Moreover, he must have benefited himself largely by working it out. Unless it was a competition, he would never dream of working out such a scheme. The whole matter rested with architects generally. If they would compete for buildings where the committee had issued instructions which were obviously absurd or unfair, then they must take the consequences. It was a pity that men would be found to compete under any kind of conditions issued. He was recently invited to compete for a work of £1100, but did not do so, though several others did. Well, if men would compete for that they would compete for most things. A great deal

DEPENDENT UPON THE ASSESSOR.

There should be a man of considerable experience of the kind of building for which the competition was being held. He did not mean that a need actually have put up an exactly similar building, but that he ought to have some general knowledge of that kind of construction. For instance, it was not a good thing for a man whose practice was confined entirely to private houses to undertake to be referee in a competition for a technical institute; and he did not think it was a good thing for a man to be referee in a competition as to the peculiar requirements of which he was absolutely ignorant. He quite believed that referees were generally thoroughly up to their work, and that they worked to the best of their ability, but if they were selected with greater care, and if competitors were to inquire beforehand who was the referee, there might be fewer less satisfactory results than they had now. One did not hear, as in his young days, of the unfair decisions by referees; one did occasionally hear of a referee carrying out a building himself, rather than give it to the competitors, but those cases were rare now, though common years ago. He thought, after all, they would have to admit that

COMPETITIONS WERE NOT ENTIRELY EVIL.

They had bad points, of course, but taken all and they probably got better buildings and architects, and young architects had better opportunities than they would have if competitions were entirely given up.—Mr. F. T. W. Oldsmith said it seemed to him that if the Institute or Association could be brought into touch with the promoters of competitions on their inception, at the very earliest stage, before they appeared in the public press, some good might be done, and some useful assistance might be offered.—Mr. Mansford Pite said there was a delight in signing a big building. Architects were amongst the people who built castles in the air, and it was delightful to be able to sit down calmly and solemnly to work out in their mind, to imagine, or to put on paper, a building that was going to run into several hundred thousand pounds, thanks to Phebe Barnst and all the wealth placed at the disposal of the Profession. How many of them were not boiling over for municipal and universal schemes?

THE ARCHITECT MUST PRACTICE DESIGN,

but that was the very thing he did not do. He acquired a knowledge of Art, and was ready to turn on the tap of Gothic, Queen Anne, Classic, or whatever it might be, when he had to design a library or a stable; but, when he practised design, he would never be expert in design. Probably the most sound advice to give to a student was to take one's self of design and work it, and, by continuous designing, master the Art. He ventured

to think that many of the successes obtained were the result of study by persistent practice. As a result of the Cole-Adams memorial about half of the competitions now had assessors. That was a distinct improvement on what previously existed. Competitions should be made more public.

THE EXHIBITION OF THE DESIGNS

must be insisted upon persistently. He had a radical suggestion to offer. He thought if assessors worked without a fee they would succeed in getting one for every competition. He would suggest that the Institute be prepared to offer an assessor to a competition committee gratis, on the sole condition that the Institute had the privilege of offering the conditions. Failing that system, let them do away with the assessor altogether, and allow the competitors, subject to conditions from the Institute, to insist upon having the assessing of the competition in their own hands. He thought no one would be able to assess a competition better than those who went in for it. There was enough honesty in the Profession to see the good points in designs, which, of course, would be exhibited without the names.—Mr. C. H. Brodie agreed with the lecturer that competitions were

ALTOGETHER DEGRADING TO THE PROFESSION.

It was easy to ask men, and especially young men, not to go in for competitions, but they knew such a request was futile, because the strongest instinct in human nature was the gambling spirit, and the competition spirit was nothing less than that, and would go on.—Mr. G. Fellowes Prynne deprecated the action of architects who obtained the award in a competition when they had engaged someone else to execute the designs. He did not think anyone could condemn competition, for it existed in almost every branch of work. It might have evils, but if conducted with fairness, and men of thorough experience were chosen as assessors, then he thought they must put up with it.—The Chairman (Mr. H. W. Pratt) also urged that it was important assessors should be above suspicion, and that the name should be published with the announcement of the competition.—Mr. Creswell briefly replied to the vote of thanks.

THE WASS collection of Royal, historical, and armorial china and coronation glass, which is at present lent for exhibition to Messrs. Goode, of South Audley Street, will be regarded with interest by the lovers of Worcester, Coalbrookdale, Minton, Derby, and Sevres china, and the more so as it includes more than thirty examples of the Worcester enamels of the late Thomas Bott. These are the enamels which the Prince Consort, according to Mr. Llewellyn Jewitt, declared to be "the best things he had seen." They are white, on a dark ground, usually of dark blue, but occasionally of other colours. Flaxman was Bott's chief model, but he sometimes copied the designs of Thorwaldsen and Gibson, and figures and heads by Raffaele, Guido, and other famous painters. More often, however, the work was wholly his own, for he was no mean artist. He had, as the pieces shown here abundantly prove, a great deal of invention, and as complete a sense of colour as of form and outline; so that, if he was not quite Flaxman's equal, he was at least a worthy successor. The specimens of Royal services date mostly from the earlier years of this century, with a few older pieces. There is a plate here from the Worcester service made for the Duke of Clarence about 1812 which cannot be surpassed, even by the fine services made much more recently for members of the Royal Family. The seven pieces of the glass used at the Queen's coronation, and formerly the property of the Duke of Sussex, are, perhaps, more curious than artistic, and more valuable than curious. One or two of them bear the Crown and Royal motto on silver, let in, we believe, while the glass was at a white heat. The other historical relics consist of pieces of Nelson's Worcester breakfast services, with a plate from the service presented to him by the City after the battle of Copenhagen.

KEYSTONES.

At Patrick Dean of Guild Court application has been made for sanction to erect a new chapel, presbytery, and school. The estimated cost of the buildings is £30,000.

SIR JOSEPH FAYRE, Bart., K.C.S.I., M.D., LL.D., F.R.S., has accepted the presidency of the Seventeenth Congress of the Sanitary Institute, to be held in Birmingham, commencing September 27th.

A LOCAL GOVERNMENT BOARD inquiry has been held at Barking, with regard to an application made by the Urban District Council for a loan of £15,000 for purposes of electric lighting, and at the same time a further loan of £8250 to erect public baths.

THE restoration of Bradford Parish Church is to be proceeded with. The Bolling Chapel, in connection with the edifice, is to be included in the restoration. There is to be a second holy table for week-day communions, a screen erected in front of the Bolling Chapel, and a screen in front of the chancel.

IN view of the adjacent works now in progress in connection with the construction of the Central London Railway and the subways in front of the Mansion House, a careful examination has been made as to the effect, if any, of these operations on the stability of the Mansion House itself, with the result that no cause of danger or alarm is found to exist.

A VETERAN architect has passed away in the person of Mr. George Williams, who died recently at the residence of one of his sons, in Virginia. Mr. Williams was a pupil of Decimus Burton, and after a tour in Greece, which he devoted to a thorough study of the ancient buildings, he began practice in Liverpool in the earlier part of the century. The great seaport on the Mersey, and its neighbourhood offer abundant testimony to the skill and industry of the deceased architect, whose work is to be seen in other parts of the country. He was a son of the late Lieutenant-Colonel Williams, and a brother of Sir Monier Williams, the celebrated Oriental scholar.

RECOGNISING the hopelessness of its original plans, the Channel Bridge Company has adopted a new scheme, still more sensational. It now proposes to build a submarine bridge across the straits of Dover, about 50ft. below the surface, and to put on this bridge three locomotive platforms, something like gigantic dining tables. The castors of these tables are to run upon rails laid along the submarine bridge, and the legs are to be long enough to carry the tables themselves clear of the water. Each table is to carry a train on a set of rails, and a train from Paris to London will simply run on to the table at Calais and off it again at Dover. Each table is to run on fifteen pairs of castors, and the motive power is to be electricity. The cost is estimated at £14,000,000—one-third the cost of an ordinary bridge.

THE New Gallery has seldom been able to show a more interesting collection of pictures than that now on view. In the first place, it is as varied as can be wished, almost every kind of work, except perhaps genre, being strongly represented, and the genre, if little gems such as Mrs. Alma Tadema's "impromptu" may be said to exemplify it, is at least good, if not abundant. In other respects there is no deficiency at all, but rather an embarrassing wealth of work by many of our best artists. Nor can anything be more catholic or more liberal than the principle that has admitted painters of all schools. The directors have regarded with equal eye Mr. Holman Hunt and Mr. Moffat Lindner, Mr. Sargent and Mr. Walter Crane, and if the result is a medley of all schools, it is at any rate a medley of much distinction. Here are three works by Mr. Watts, two by Sir E. Burne-Jones, two by Mr. Holman Hunt, four by Mr. Sargent, one by M. Carolus Duran, three by Mr. J. J. Shannon, and landscapes by Mr. East, Mr. Thorne Waite, Mr. Peppercorn, and many others whose work is well known and always of importance.

Professional Items.

ABERDEEN.—The question of dealing with Greyfriars Church has engaged the attention of the Aberdeen Town Council for some time. At a recent meeting a report was received from the Finance Committee, stating that they had had under consideration the letter from the University Court in regard to the gift of £10,000 from the anonymous donor, and the proposal to hand over the old building of Greyfriars Church to the University with the view of its restoration and incorporation for academic purposes. The committee met and conferred on the subject with a deputation from the University Court. They have also had before them the various memorials which were addressed to the Council in support of the retention and restoration of the church. After deliberation, they resolved to report that, in their opinion, it would not be advisable to retain the fabric if it were to be devoted to academic purposes. It was resolved, however, to recommend that in the event of the anonymous donor consenting to continue his offer of £10,000 to the extension scheme, the Town Council should agree to restore the church with the view of its being retained for the use of the congregation, on the understanding that the University Court obtain the concurrence of the Presbytery and the Kirk-session to the proposal, and that the requisite funds are raised for the completion of the scheme. The report was confirmed by the Council.

ALLOA (Scotland).—New public baths, costing nearly £30,000, have been erected at Alloa. The style of Architecture is a free treatment of French Renaissance. The architects were Messrs. Burnett, Son, and Campbell, St. Vincent Street, Glasgow. On either side of the entrance hall there is billiard and news-rooms. Immediately beyond is the principal booking and towel office. The bath is 75ft. long and 33ft. broad. The hall wherein the bath is situated is 98ft. long and 50ft. broad. The roof, an open timber one, rises to a height of 25ft. from the level of the floor. There are galleries for viewing aquatic sports. The gymnasium is a chamber 76ft. long and 28ft. wide, with an open timber roof averaging 22ft. in height. There are two sets of hot and cold plunge baths, a first-class set and a second-class set. A Roman bath has been provided.

ASHILL.—The timber and stonework of the church tower have become very much decayed with age, and it has been decided to put the tower in a thorough state of repair. The whole of the top is to be taken off, and a new one of Ketton stone and flint, with the addition of stringed courses and moulded battlements, put on. The whole of the timbers and lead work are to be new. The plans are by Messrs. Milne and Hall, architects, London. The church has recently been fitted with hot air apparatus. At the completion of the work to the tower the bells are to be rehung. The work is being carried out by Messrs. Waters and Son, builders, Watton.

BELFAST.—A new Orange Hall in connection with No. 9 District, West Belfast, has been erected. The structure, which is situated on the Shankill Road, has a frontage of 46ft. 6in., and extends from front to rear, along Brookmount Street, 105ft. A corridor, 6ft. wide, runs from the entrance vestibule down the centre, and communicates with the side entrance at the back. In the front entrance vestibule the stairway is located which leads to the large hall; behind it, on the left, are lodge and ante rooms, and on the right, the reading, arch, and box rooms. Between these and the further end of the building, where the caretaker has his apartments, are provided a back stairway, lavatories, hall, kitchen, yard, and other conveniences. The lower ceilings are 13½ft. high, and the large hall is 32ft. by 36ft. In front there is a gallery about 12ft. wide, off which are a number of ladies' and gentlemen's retiring rooms. The side walls

are 16½ft. high to wall plate. The roof is supported by five semi-elliptical rolled steel trusses, and two half ones at each end, all resting on moulded cut-stone corbels, and bolted to same. The walls are broken up by pilasters under corbels, and the large arch in the rear wall is ornamented with a moulded archivolt. An ornamental gable rises in front, and is furnished with neat gablet copings and parapet. The entire work was carried out by Messrs. Campbell and Lowry, contractors, from plans and specifications prepared by Mr. Wm. Batt, architect, Royal Avenue.

BISHOP AUCKLAND.—A cottage hospital is about to be erected at Bishop Auckland. It will be 150ft. by 90ft. On the right of the vestibule will be the male and female wards, each containing four beds, and having a southern aspect. The bath and lavatory accommodation will be arranged in close proximity to the wards. On the left of the vestibule will be the matron's room, from which she will have command of the whole building. On the north-west will be the surgeon's room and dispensary, whilst the operating room will be entered from the hall on the east, and will have a large top light. The kitchen, scullery, larder, mortuary, and disinfectant rooms will face the north. The drainage is arranged on the straight line principle into the inspection chambers. The exterior of the building will be treated in the domestic style of Architecture, with red tiles, stucco gables, red quoins and arches, and grey clamp burnt brick facing. The architect is Mr. James Garry, West Hartlepool.

BRIDLINGTON QUAY.—The contracts for the whole of the work to be done at Holy Trinity Church, Bridlington Quay, to plans by Messrs. Smith, Brodrick and Lowther, architects, Hull, have been let to Mr. Anthony Lyons, contractor, Norton, Malton.

CARNOUSTIE.—A clubhouse is about to be erected in Park Avenue, Carnoustie, for the Union Club Company. The building will be in the Classic style of Architecture, two stories in height, the front wall being finished at top with a panelled parapet, with moulded pedestal and caps at intervals. The building has a frontage to Park Avenue of 37ft. The contractors are:—Masonry, Messrs. A. Black and Son; joinery, Messrs. A. Watt and Son; slater, Mr. A. Hogg; plumber, Mr. D. McKay; plastering, Messrs. A. M'Ritchie and Co.—all of Carnoustie. The plans have been prepared by Mr. David Fraser, Carnoustie, and the work will be carried out under his supervision.

DERBY.—In the new Church of St. Augustine's, Derby, accommodation is provided for 430, but, when the finances will admit of it, and the chancel, vestry, and south aisle are built, the church will provide sitting room for 750 people. So far, an expenditure of £3225 has been incurred. The builders are Messrs. J. T. Tomlinson and Co., and the architects Messrs. Naylor and Sale.

EDINBURGH.—The new Home in course of erection for the Edinburgh Industrial Brigade occupies a commanding position. On the Fountainbridge and Ponton Street frontage it will consist of four stories and a basement, and towards Thornybank there will be three stories. The Fountainbridge frontage will have several shops. The frontage above the shops will be finished with stone, while those towards Ponton Street and Thornybank will be with terra-cotta faced bricks. The house will occupy an area of about 815yds., and will be built round an open court. The site for the building has cost £3000, and the estimates amount to about £10,500, making a total of £13,500. The plans have been prepared by, and the whole will be carried out under the direction and supervision of, Mr. Frank W. Simon, architect.

LEEDS.—The memorial stones have been laid of a Methodist New Connexion Sunday School. On the site of the new building a Sunday school had stood since 1856, and the chapel was erected twenty-five years ago. The old school building has now been pulled down,

and, from designs by Mr. W. S. Braithwaite, a new building is being erected. It is to be a two-storied edifice, the ground floor being an assembly room, and the upper floor comprising a preaching room and six class-rooms.

LOCKERBIE.—The new Parish Church at Lockerbie, which has been in course of erection since the demolition of the old building in the spring of 1896, has been opened. The new building is of red freestone. The style of Architecture is the Early English Gothic. The architect has adopted a square tower, with battlement and pinnaced parapet rising to a height of 65ft. A miniature octagonal spire of stone rises to a further height of 30ft. and finished with carved stone crockets, and is completed with a weather vane on the top bringing the total height of the tower up to 95ft. The total cost was about £5000. The architect was Mr. F. J. C. Carruthers, Dumfries.

LONDON, W.C.—The old Chief West Central District Post Office at the corner of Southampton Street, Holborn, has been closed for good, and the new building in Hyde Street, New Oxford Street, opened for the transaction of business. The lower sorting-room is a huge apartment 168ft. in length by 58ft. in width fitted with every modern appliance for facilitating sorting operations. Above is another reserve room equally large. In the basement there are recreation rooms and kitchens for the general staff. There is also an institute, but for messengers only—in this part of the building. The new post office is from the designs of Mr. Henry Tanner, architect, Her Majesty's Office of Works.

LUDDENDEN.—A new organ chamber, choir vestry, &c., are being added to the present church at Luddenden. The present organ now in the west gallery is to be substituted by one of greater capacity, and on a more modern principle, by Messrs. Abbot and Smith, Leeds. The organ chamber is provided with a basement floor, available for hydraulic lifting, and has well-proportioned double-arch openings into the chancel on the north-east side thereof, with cusped openings above and below gallery in nave. Beneath the new choir vestry will be cellaring for heating apparatus and coal store. The architect for the work is Mr. T. L. Patchett, of Halifax. The mason work is to be done by Mr. Thos. Pickles, Midgley; the contractors for the other departments being:—Carpenter and joiner, Messrs. Eli Alderson and Co., Luddenden; plumbers and glaziers, Messrs. John Nay and Son, Halifax; slater and plasterer, Mr. John Robinson, Luddenden.

PERTH.—Plans have been approved for the erection of a new theatre on a piece of ground between Mill Street and High Street. The new theatre will have an entrance from High Street, the principal street in the city. The plans show seating accommodation for about 1000 persons, but can be extended to accommodate 1300. It is intended to fit the place with wires with a view to the electric light being utilised. Building operations will begin immediately.

PORTSMOUTH.—The new buildings for the Pearl Assurance Company, to be erected at the corner of Commercial Road and Grigg Street, will be commenced immediately. The plans have been prepared by Mr. C. W. Bevis, Southsea. The block will consist of office with four shops, and a private hotel, and the Company has decided to widen the road at the corner to 60ft. by setting back the buildings to a depth varying from 18ft. to 9ft. the length of frontage. The tender of J. H. Corke, for £24,150, has been accepted for the work.

WOMBWELL.—The nave of the new church which is in course of erection as the Parish Church of St. Mary's, Wombwell, has been consecrated. The church is from designs by Messrs. Garland and Hadfield, Sheffield. The floor of the nave is set with wood blocks, side aisles paved with tiles. Only the chancel has yet been built, costing about £5000.

Under Discussion.

LIVERPOOL ENGINEERING SOCIETY.

At the twelfth ordinary meeting of the present session of the Liverpool Engineering Society, Mr. John A. Brodie was appointed President for the ensuing year, and Messrs. A. Comley-Holmes and Mr. John A. F. Aspinall were elected vice-presidents. A paper was read by Mr. Hugh Rogers, of the Liverpool City Board service, upon the "Liverpool Landing-stage Extension and Prince's Jetty."

SCULPTURE IN RELATION TO ARCHITECTURE.

The Edinburgh Architectural Society met recently to hear a paper by Mr. T. Duncan, M.D., on "Sculpture in Relation to Architecture." Mr. A. Lorne Campbell was in the chair. The lecturer, after bitterly lamenting the want of sculpture in modern work, and attributing it to the ideas of building committees and schools of Art, traced the history of sculpture in connection with Architecture, aiming that that was its highest branch. Mr. Rhind praised the present French school and system of encouraging sculpture.

INSTITUTION OF CIVIL ENGINEERS.

At the general meeting of the Institution of Civil Engineers, Sir John Wolfe Barry, President, in the chair, the result of the ballot for the election of officers was declared as follows: President, Mr. W. H. Preece, C.B.; vice-presidents, Sir Douglas Fox, Mr. James Managh, Sir William Anderson, and Sir William Hite; other members of the council, Mr. James Barton (Dundalk), Mr. Horace Bell, Sir Alexander Binnie, Mr. Thomas Forster Brown (Cardiff), Mr. Henry Deane (Sydney), Mr. R. R. Galbraith, Mr. George Graham (Glasgow), Mr. J. C. Hawkshaw, Mr. Charles Hawksley, Mr. G. H. Hill (Manchester), Dr. Hopkinson, Mr. J. C. Inglis, Mr. Alexander Macdonald (India), Dr. Alex. B. W. Kennedy, Mr. John Kennedy (Montreal), Sir James Kitson, Mr. P. (Leeds), Mr. A. G. Lyster (Liverpool), Mr. William Matthews, Sir Guilford Molesworth, Sir Andrew Noble (Newcastle-on-Tyne), Mr. Alexander Siemens, Mr. Thomas Stewart (Lape Town), Mr. F. W. Webb (Crewe), and Mr. Leader Williams (Manchester).

SOCIETY OF ARCHITECTS' ANNUAL DINNER.

The annual dinner of the Society of Architects was held at the St. James's Restaurant, Piccadilly, W. The president, Mr. Walter Paden, occupied the chair. Mr. Atherley-Mones, M.P., in proposing "The Society of Architects and Architecture," said the institution had not as yet attained very mature years; "had only reached the interesting age of sapling. But it had an object in view, which was to raise, not the individual status of its members, because that was scarcely a necessary object to aim at, but the standard of Architecture, and to secure greater benefits for the public at large. He regretted the difficulties that had hitherto stood in the way of the passage of an Architects' Registration Bill, but he could advise the Profession, in the face of the many difficulties before them, to resort to the system of lobbying in order to secure the passage of such a measure. The Legislature had, in his opinion, been neglectful of the interests of the architectural profession. The President, in responding, referred to the question of a Registration Bill, and said it was not his intention or desire of a society such as theirs that there should be a monopoly. All they asked was that in the future those who were to join the Profession should not enter it without some guarantee that they would pass qualifying examination.

SHEFFIELD SOCIETY OF ARCHITECTS.

The annual meeting of the Sheffield Society of Architects and Surveyors was held at the School of Art, Arundel Street, the President, Mr. R. W. Fowler, F.S.I., in the chair. Mr. J. Innocent, the Honorary Secretary, read the annual report of the Council, which stated that the past year closed with the highest

balance in hand the Society had ever known. Numerically, the Society had continued to grow, and, although there were two deaths, two withdrawals, and three lapses of membership during the year, there was a net increase of eight members. There were now 114 members, consisting of 31 fellows, 43 associates, 18 students, 5 honorary, and 17 lay members.

—Mr. F. Fowler, Honorary Treasurer, presented the balance-sheet, which showed a sum of £121 18s. 7d. in favour of the Society. The report and balance-sheet were adopted. On the motion of the President, seconded by the Vice-President, and supported by Mr. Fenton, a vote of thanks was passed to the Honorary Secretary, Mr. C. J. Innocent, who declined to be re-elected. Thanks were also passed to the other officers and the Council. The ballot resulted in the following elections for the ensuing year:—President, Mr. E. W. Fowler; Vice-President, Mr. J. Smith; Hon. Treasurer, Mr. F. Fowler; Hon. Secretary, Mr. W. C. Fenton; Council, Messrs. C. Hadfield, E. M. Gibbs, C. J. Innocent, T. Winder, A. Smith Denton, J. R. Wigfull, and J. B. Mitchell-Withers.

BUILDING FEDERATIONS.

At the annual meeting of the Newcastle, Gateshead, and Tyne District Master Builders' Association, Mr. Walter Lowry was re-elected President for the ensuing year. In his opening address, Mr. Lowry said during last year one matter of very great importance to the building trade had been accomplished. He referred to the formation of the Northern Counties Federation of Building Trade Employers. Great success had attended its formation, as the whole of the Master Builders' Associations in Northumberland, Durham, Westmoreland, and Cumberland (with the exception of one with whom negotiations were pending) had consented to join. He might mention that Federations of a similar nature were and are being formed in most of the other counties in England, with the intention eventually of all joining together and forming a National Federation of the Building Trade Employers of England. That there were great benefits to be derived from a combination like this it did not require any words of his to explain, but he wished it to be clearly understood that the objects of this Federation were conciliatory to the operatives, and that it would, in all cases of dispute with them, do its utmost by arbitration or otherwise to avoid strikes and lock-outs.

INCISED SLABS.

The Essex Archaeological Society recently gathered at Colchester Castle for their annual meeting, Mr. Henry Laver, F.S.A., presiding. —Mr. Miller Christy gave some information about two interesting rubbings—one from a slab in Brightlingsea Church, and the other from the matrix of a brass at Pleshey. The first presented a beautiful incised floriated cross, rising from a conventional Calvary, and having five smaller crosses—two at the foot, one at the left side of the main stem, and two above the arms near the top. He believed it to be of not later date than the twelfth century, and possibly of the eleventh. The rubbing from Pleshey showed the outlines of recumbent male and female figures. —The Chairman declared that the making of these incised slabs and brasses burst into perfection at once, without any preliminary period of less perfect Art. The earliest brasses and slabs known, those of the twelfth and thirteenth centuries, were the most beautiful the world ever saw, or probably would ever see. They were very rare in England, but most abundant in the churches of Holland and Belgium. —Mr. Lyman, F.S.A., did not agree with this, remarking that slabs and brass matrices were very common in the Midlands, though, owing to the coarseness of the stone employed (millstone grit), they were very rough at the edges. Incised work occurred very frequently in alabaster.

MR. GLADSTONE has promised £1000 towards the cost of erecting a new church at Shotton, Hawarden.

Correspondence.

ST. MARGARET'S CHURCH, WESTMINSTER.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—In a paragraph on page 199 of your issue of a fortnight ago, it is implied that the roofs of this church are ancient. This is not the case; they date probably from the last century. The plaster ceilings were renewed, and the oak ceilings, with three ribs, arches, &c., substituted during the restoration of the church some twenty or five-and-twenty years ago.

As the paragraph is misleading, you may like to make this correction.—I am, Yours faithfully, X.

CONCERNING COMPETITIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—In the *résumé* of my paper on "Competitions," published in your last issue, the value of the average competition should have been stated as £9000; the average cost of making a set of drawings, £30; and the number of competitors, 40.—Yours faithfully, H. B. CRESWELL.

Enquiry Department.

I. C. B.—Will I. C. B. please forward his address—not for publication.

COMMISSION ON AN UNFULFILLED CONTRACT.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Sometime ago I was instructed by a client to prepare plans, specifications, &c., for a house he proposed to build at an agreed remuneration of five per cent. on the cost of the work, such agreement including preparation of the contract drawings, specification, &c., obtaining tenders, submitting plans to the District Council, and superintending the erection of the house, and it was further agreed that if the plans, &c., were prepared and the tenders were too much, or for any other reasons that the work was abandoned, the charge should be 2½ per cent. After having prepared the plans to his requirements, and about half completed the specification, he instructs me not to proceed any further, as he has bought an adjoining house, and does not therefore require to build. As he disputes the amount charged by me, will you please inform me, through the medium of your valuable journal, what percentage you consider I am entitled to under the circumstances, and if such percentage should be charged on the estimated cost of the proposed house.—Yours faithfully, "DOUBTFUL."

We are of opinion that you are entitled to a commission of two or two and a quarter per cent. of the amount you were instructed to spend on the house.

MUNICIPAL AND COUNTY ENGINEERS' EXAMINATION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—In answer to "Subscriber," re Engineering Examination, I should advise him to procure the Surveyor for January 15th, 1897, wherein he will find a complete list of books pertaining to the four divisions of the Municipal and County Engineers' Examination—a list which I supplied to that paper, and which list was spoken very highly of by various municipal engineers, &c., in the country. The list contains both elementary and advanced books. With regard to books on hydraulics and the Public Health Acts, "Subscriber" will find all he requires in "Practical Hydraulics," by Bore; "Applied Mechanics," by Cryer and Jordan; "Elementary Hydrostatics," by Briggs and Bryan; Lumley's, or Glen and Jenkins' "Public Health Acts"; or "Practical Guide to Sanitary Legislation," by Angel and Morley.—Yours,

EGBERT RUSHTON,
Inspector and Surveyor to Cleethorpes-with-Thruscoe Urban District Council.

Trade and Craft.

MESSRS. COBBETT AND CO.

This firm of timber merchants' head depôt is at Virginia Road, Bethnal Green, E. Amongst the timbers always obtainable here are the American whitewood, black walnut, and oak, kept in a variety of thicknesses and widths. Mahogany is also extensively stocked, and can be cut to boards of whatever thickness required. Other timbers supplied by Messrs. Cobbett and Co. include satin walnut, Kauri pine, Oregon pine, Sequoia or redwood, pitch pine, birch (including American birch for chairmakers), Canadian ash, teak, veneers, &c., all of which is listed at various sizes. Yellow joinery deals, battens, flooring, matching, scantlings, and, in fact, any kind of wood used in constructional work is stocked by the firm, who also make a speciality of squares for turning, walnut and oak flats for framing, mahogany cut out for newels, birch and deal turned table legs, planks for picture backs, prepared panels, planed fret woods, and picture frame mouldings. They likewise make prepared flooring a feature, supplied in maple and quartered oak, tongued and grooved, hollow backed to prevent warping, bored for secret nailing, and with a surface ready for polishing.

CONSOLIDATED FIELD FENCING.

Wire fencing has been in vogue many years, but not till a comparative recent date have the developments taken place which have led to its present-day popularity. One of the latest improvements is the woven wire fence, invented and supplied by the Consolidated Steel and Wire Company, of New York, for whom the London agents are Edward Le Bas and Co., 18, Billiter Street, E.C. The woven wire fence is made in various styles and sizes to suit all requirements, a feature of the construction being the winding of the joint and the crimp in the strand wire which prevents its moving out of place. It is an adjustable fence, and by reason of the way the joints are made and of the square mesh can be stretched over uneven ground and always kept the same distance from the ground. The method of making the joint is such as to abolish the use of small wire, and leave greater strength; and it may be mentioned that on account of the extreme twist in forming the joints only the best steel is used. The crimp provides for expansion and contraction, so that there is no danger of the fencing being weakened by the influence of heat or cold. The catalogue published by the Company gives illustrations of the several designs and also full particulars for erecting the fencing.

THE TRUSTY OIL ENGINES.

The Trusty Oil Engines have of late gained considerable favour. The principle upon which they are worked is that generally known as the "Otto," or "Four Cycle." A vast amount of study has been devoted to this principle, with the result that many improvements have taken place, and now we have the Trusty Oil Engines, which can be worked with ordinary petroleum or kerosene oils. They can be adjusted to work as well and economically with the heavy mineral oils, having a flashing point of 250deg. Fahr. After close test. Amongst the other features of the Trusty Oil Engine is its simplicity by the fewness of parts, the easy access to the working parts, its compactness, hence its suitability for working in a limited space; the safety with which it can be worked, and the absence of chimney, smoke, water gauges, safety valves, &c., while it is stated that its use effects a saving of 50 per cent as compared with steam power. It is possible to convert a Trusty Oil Engine into a gas engine, or vice versa. The horizontal engines are suitable for electric lighting, pumping, sawing, engineers' shops, brick machinery, &c., while portable engines of the same principle are adapted for contractors' and builders' work, pumping, farming, &c.; in fact, either would be a good substitute where steam or other motive power is required. The Trusty Oil Engines secured the highest award

and gold medal at the Queensland International Exhibition, at Brisbane, last year. The works are at Cheltenham.

AN ELECTRIC LOW-WATER ALARM.

Wherever steam is used as a motive power, there danger is also. A simple and effective precaution against this danger is a need which has long been felt. Brown's Patent Electric Low Water Alarm for steam boilers appears to meet the want in many respects. By the aid of this invention an indication that the water in the boiler is getting too low is easily conveyed. A mercury tube, similar to the thermometer tube, is encased in a metal fitting, which is attached to the boiler front by a pipe and elbow inserted at low water level, or through the crown of shell (as in a marine type); two platinum wire ends are inserted in the sides of the mercury tube above the normal position of the mercury, one of which is attached to the fitting, thus forming the earth part of circuit, and the other to the insulated binding screw at the top. There is, therefore, only one wire to the bell and battery. So long as the water in the boiler is above the low-water level, it is forced up into the pipe and body of fitting; the temperature, by the cooling action of the atmosphere, quickly falls below boiling point, thereby keeping the mercury below the wire ends; but should the water fall below the low water line, the water, by its gravity, falls back again out of the pipe and fitting, which is instantly filled with steam, the higher temperature causing the mercury to rise above the two wire ends, thus making a mercurial connection between them, completing the electric circuit, and causing the alarm bell to ring. Upon the water being replaced the mercury falls, thus breaking the circuit and the alarm stops. The invention is recommended as having no working parts to get out of order, for its cheapness, and for its ready attachment to any boiler. It is supplied by Messrs. Arthur D. Studd and Co., of Montague Street, Kettering, who, as engineers, merchants and factors, also supply all kinds of contractors' and builders' machinery, metal fittings of every description, engineers' tools, oils, &c.

The Princess's Theatre has been closed for extensive alterations, necessarily occupying several months. The interior will be virtually rebuilt, the intention being to increase the pit and gallery, whilst making the slope less steep. There will also be more stalls and more private boxes. The reconstruction, under Mr. Blomfield Jackson, is to be thorough.

The scheme for providing increased church accommodation in the diocese of Manchester, is to build in the next five years sixteen churches, at a cost of £3000 each; and eleven mission-rooms, at a cost of £1000 each. £20,000 is required for the sites. All the churches and mission-rooms built are to be of a plain and commodious character, on the lines already laid down by the Bishop.

The annual exhibition of the work of the students of the Battersea Polytechnic shows that the appreciation of the advantages offered by the institution are well maintained. The work on view included carpentry, decorative and artistic design, carving, photography, iron-work, plaster models, brickmaking, and plumbing. Most of the trade and engineering work is carried on in the evening by young students employed at their various trades in the daytime.

In connection with the memorial to the victims of the Charity Bazaar, at Paris, last year, the first stone of a monument destined to commemorate the tragic event will be laid to-day, May 4th. The final plans of the monument not having yet been submitted to the committee, it would be impossible to give a full description of it. Suffice it to say that the monument will be a fine one, and will do the greatest honour to the two architects to whom the construction has been confided. The two architects are M. Guilbert, Inspector-General of Historical Monuments, and M. Trilhe, well known for his remarkable works in the Château of Combourg, belonging to the Comtesse de Chateaubriand.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BLETCHINGLEY.—Accepted for additions to work house, Bletchingley, Surrey. Mr. Fredk. Elliff, architect, Caterham. Quantities by Mr. G. H. Chapel. F. G. Minter, Westminster. £15,537.

CARLETON (Yorks).—For the erection of ten dwelling houses at Carleton, Pontefract, for the Carleton Coal and Brick Company. Messrs. Greaves & Sidebottom, A.L.E., Ropergate-chambers, Pontefract. B. Wormald. £1,125. Wilson Dixon. 1,325. Beilly and West, Pontefract (accepted). 1,310. Six Lowest Trades. 1,429.

CHADWELL HEATH.—For Contract No. 3, superstructure of lunatic asylum, Chadwell Heath, Essex, for the County Borough of West Ham. Mr. Lewis Angell, architect to the Corporation. Gregar and Son. £247,700. Chessum and Son. £221,433. Patman and Fotheringham. 235,000. Leslie and Co. 290,531. Shillitoe and Sons. 226,964. Pattison and Sons, Ruskington*. 198,211. * Accepted.

DEVONPORT.—For structural alterations to "The Wellington," William-street, for Mr. T. H. Bryant. Mr. Robt. H. B. Neal, architect, Central Exchange, Plymouth. J. P. Berry. £1,692 0 0. J. H. Blackhall. £1,451 0 0. J. Goad and Co. 1,535 0 0. H. Full. 1,340 10 0. G. B. Turpin. 1,495 0 0. J. H. Palmer (accepted subject to revision). 1,233 0 0. A. R. Lethbridge & Son. 1,468 0 0. F. O. Ambrose. 1,467 10 0.

KING'S LYNN (Norfolk).—For rebuilding business premises at High-street and Union-lane, for Messrs. Jermyn and Sons and Messrs. Jermyn and Perry. Mr. H. J. Green, architect, Norwich. J. S. Smith. £29,040 5 0. P. Banyard. £8,504 14 1. R. Dye. 8,996 0 0. Kerridge & Shaw. 8,373 0 0. R. M. Parkinson. 8,900 0 0. Cambridge*. 8,373 0 0. J. Youngs & Son. 8,635 0 0. Bardell Bros.†. 8,189 0 0. * Accepted conditionally. † Too late.

LONDON PLATE-GLASS INSURANCE CO. Ltd.

Head Office: 49, Queen Victoria St., E.C. Glass of all kinds covered by the Policies of this Company. MODERATE RATES. PROMPT REPLACEMENTS. SURVEYS AND ESTIMATES FREE. Ten per cent. of the Premiums returned every six years in cases where no claim has arisen. Applications for Agencies Invited. Liberal Terms for Business Introduced.

BOWER & FLORENCE, Polished Granite Manufacturers, ABERDEEN, N.B.

Above prices include dovetailing.

VIGERS BROTHERS, TIMBER MERCHANTS.

Head Office—67, KING WILLIAM STREET, E.C. Mills—LOTS ROAD, CHELSEA. Telephone No. 601 Avenue.

HADLEY Herts.—For the erection of three cottages, for Mr. G. Walter Davis, surveyor, 61 and 62, Ancery-lane, W.C. Quantities by Mr. E. A. V. Garnham, Great James-street:—
Messrs Ellwood ... £1,288 | H. Harrison, Hadley Green (accepted) ... £1,154

HARWICH.—Accepted for the supply and erection of a cast-iron tank to hold about 275,000 gallons, including sub and superstructure of steel stanchions, girders, and piping, &c., for the Tending Hundred Waterworks Company, Harwich:—
Pearson and Co., St. Dunstan's-hill, London, E.C. ... £2,182 12. 6

LEEDS.—For the erection of two houses, Victoria Park Estate, Bramley. Mr. H. Swanwick, architect, 101, Burley Lodge-road, Leeds:—
Bricklaying and Masonry.—W. H. Nichols, Wortley, Leeds ... £395 0 0
Carpentry and Joinery.—Irving & Bristow, Leeds ... 284 19 4
Plumbing and Glazing.—Story & Co., Leeds ... 92 12 0
Plastering.—J. H. Brook, Armley, Leeds ... 50 11 0
Slatting.—John Atkinson and Son, Leeds ... 38 0 0

Total ... £861 2 4

LONDON.—For pulling down and rebuilding 50, Rupert-street, Haymarket. Messrs. Chambers and Dewes, architects, 4, Bloomsbury-place, W.C.:—
Dove Bros. ... £2,195 | Whitehead ... £2,125
Anley ... 2,160 | Perkins ... 2,119
Lathey Bros. ... 2,130 | F. G. Minter (accepted) ... 2,100

LONDON.—For the erection of four shops in High-street, Harlesden, N.W., for Mr. F. W. Sanderson. Messrs. Saville and Martin, architects. Quantities supplied:—
J. O. Richardson ... £8,523 | T. E. Mitchell ... £7,464
Shurmer and Co. ... 8,450 | Burman and Sons ... 7,390
Patman and Fotheringham ... 8,231 | W. D. Palmer & Co. ... 7,350
Peacock Bros. ... 7,180

In Architectural Causerie.

Painters of architecture. A BUILDING or collection of buildings, whatever purpose it serves, is something which meets the eye, and whether it elicits or gives pleasure must tend to develop the architectural sense. Where the population is densest the contrasts must be the most startling. Put the case of our English cathedrals and the towns which have grown up around them. Mr. Hine it appears has lately painted them all, and the results of his—and of Mrs. Hine's—studies are to be seen at the Dowdeswell Gallery, where a collection of drawings of "English cathedrals and their Towns" is on view. Does the public require the writer to say exactly how they compare with others of similar kind, or may he be allowed for once to aver, avoiding the oath, that he has seen and enjoyed a great many? Looking back to past masters for examples of what architectural paintings should be, he finds Samuel Rout in the front, and, returning again to the present, the name of an artist occurs whose works contain in themselves the quintessence of Ruskin's preaching and Turner's practice. Whoever visits the Gallery will discover the artist's limitations at once. In his case, as in that of more eminent painters, they are things to be taken for granted. There are poetical aspects of churches and towns to which he is keenly alive, and has often successfully rendered. It is, then, not the landscapes to which buildings or indications of buildings are incidental, that we must thank these two painters, for "contraptions" of brick and mortar are inseparable from our modern conception of life, and there is no peace so profound as that which is felt in the time-hallowed precincts of cathedral churches and abbeys. So, leaving the details to the photographer, the artist may surrender himself to the mood of the moment. If not music there is at least its equivalent in the silent song of the poet-painter. Mr. Hine, it may be because he is not alone in the world, would appear to be most familiar with the unmiest aspects of things, and this is not remarkable considering the miseries due to our climate which the landscape-painter must suffer during three parts of the year at least. We could mention the name of an artist whose "snow scenes" are invariably painted in summer, and who, with his green umbrella, excites mirth in the heart of the country. There are none of them here, however, and Mr. and Mrs. Hine would seem to have been favoured, or blest, with protracted spells of warm weather. Excepting Ripon and Chester there are views of all the cathedral towns. Mrs. Hine's compositions are generally compact and well disposed. In colour she attempts less than her husband, and this imitation distinguishes her paintings from his. She draws at least as well, but drawing has been suggested or said is not their strong point, and there are cases, not a few, in which the want of precision is painful. In the paintings which are most strictly architectural, such as the views of Lichfield and York from the West but little is wanted but the mere fact of the matter,

and here the photographer has the advantage. The camera, though only a sun-trap, may be useful on occasion to the would-be architectural painter. In the Exhibition of the New English Art Club, where least they might be expected, there are one or two paintings which would point the moral of the foregoing remarks, and also adorn the tale. The drawing of the Church of St. Theodore, Athens, by Miss Mary Hogarth, exhibits, in the opinion of the writer, the perfection of architectural painting. While perfectly true to the fact, and forgetful of self, the painter is yet aware of the artistic worth of the subject.

PICTURES AT THE ROYAL ACADEMY.

SECOND NOTICE.

PROBABLY the best way of conveying to the reader a general idea of what there is in this Exhibition is to attempt a mental rearrangement of the collection, and let the pictures selected be regarded as the best of the class to which they appear to belong. In a sea-girt island like ours which is simply

A FIREPLACE. DESIGNED BY C. H. B. QUENNEL. MANUFACTURED BY J. P. WHITE, BEDFORD.

IN ILLUSTRATION OF "A PIECE OF FURNITURE."

The other, by Will Rothenstein, of Vezelay Cathedral, appears to be beyond praise. Here, indeed, is a picture, and yet the church in itself has hardly any external feature.

riddled with waterways the landscape is often a seascape as well, and the difficulties which beset the would-be methodical writer are not inconsiderable. As the hart panteth after the

water-brook the landlubber loveth the sea—or at least he pretends to—and the sailor in turn thinks of nothing so often as England's hills and vales. The girls he has left behind him may be held to account for this, but whatever the reason may be, we are near to being amphibious.

In so far as we are Celtic or Danish, we care less for merely pastoral scenes than the inhabitants of middle England, but the last are by far the most numerous, and their preferences must be respected. For them are the farmsteads and haystacks, the kine and the baa-lambs, the muck of the yard, and the duck-pond. To the Sun God, giver of life, the subject matters but little, and he glorifies all that he shines on. Love lieth in wait till he sinks in the west, and then there are "Twilight scenes" within! How many in this particular place we have not as yet ascertained, but the rooms would seem empty without them, and because Nature's aspect at evening is familiar to all we may be sure that they are not as a whole ill-painted.

For the delectation of the typical Saxon, we have imported our painters from France, and have Englished the art of Millet and the rest of the Barbizon school. There results a good deal of uncouth realism, but taking this along with the rest there is much to be thankful for in their contribution. Perhaps Mr. Wetherbee's paintings may be taken to represent the new school at its best, and it is natural in this connection to think of Adrian Stokes, George Claussen, William Padgett, La Thangue, and others. Turn we now from the land to the sea. There would be reason for shame, indeed, if we had not marine painters in almost infinite numbers, and amongst them the very best. Where so many are more than good it would be exceedingly hard to particularise, and within the limits of space it cannot be attempted. Mr. Bernard F. Gribble's great battleship, No. 433, is justly considered a most splendid work of its kind, and in striking contrast with this is Mr. Tuke's "Idyll," showing miles of the bluest sea.

The proportion of portraits must always be large, and, as love of the subject but seldom inspires the painter, we hear a great deal more about the exquisite Art than about the people depicted. The portrait of Johannes Wolff, Esq., by John S. Sergeant, R.A., is his most triumphant achievement. There are portraits of ladies here who remind one of Wordsworth's "Lucy"—"a maiden there were none to love, and very few to praise"; but the purse has secured the work, and the artist has done his best. A pity it is that the noblest and loveliest can be painted so seldom! The most beautiful and absolutely faithful portraits of children are those by J. Sant, R.A. One wonders that work of this quality can still be produced by a painter who, for at least fifty years, has been a most constant exhibitor.

Mr. Richard Jack—we judge by his fascinating "Circe," and by the "Portrait of a Lady," No. 200—is certain before very long to be ranked with our greatest painters. The former is certainly one of the loveliest possible creatures, but as a whole the painting wants something; a little more work, perhaps, that, when it came to be added, would in no way exhaust the painter. There are *lacunes* between the outbursts of impulse, and leisure for after thoughts. "Dorothy," the daughter of W. H. Kendal-Grimston, Esq., must take her place with the few that are perfectly pictured. The portrait attracts, as well by its delicate bodily grace, as by the subtle, semi-serious, amusingly sweet expression which the eyes have lent to the face. The painter is George Boughton, R.A. Before leaving the subject of portraits let "Summer," by Alfred Hartley, be mentioned, and No. 325, as Mr. Orchardson's best—a portrait of Mrs. Pattison.

We are lingering here in the Fifth Room, where "The Thurifer," by Miss Josephine M. White, was noticed with very great pleasure. In the Sixth Mr. Kennington's "Diana" is pleasing on account of the harmonious disposition of the principal figures, the reality of their ample forms, and the easy command of his art which the painter displays. Mr. Harold Swanwick's "Old Farm Yard" should have been mentioned just now when we were speaking of landscapes. If M. Carolus Duran is to be allowed, to the exclusion, perhaps, of others, to exhibit things like his portrait of the Duchess of Warwick, it should be seen whether the terms of our Extradition Treaty may not be made to apply to his case. The mood passes, however, for the painter, as everyone knows, is clever enough, and we presently come to a much better picture of his, "Madame Feydeau and her Children" (483).

In Room No. 7 the pictures of simple life are the best. In this department of Art the English painter who received his first inspiration from Holland is as nearly as possible perfect. The spirit which breathed in Morland and Burns inspires all our best painters and poets, and if we light upon anything that smacks not of the court or the studio, we may be sure that the intention at least is right. The best beyond doubt in this room are "The Cousin from Town," by Walter Langley, and Arthur Barrington's "Fortune Teller." The two works in point of style are as different as possible, but good work is good work, and it happens to be all that we care for. The principle by which we are guided, if it deserves so lofty a name, should be tolerably clear by now, and we may be allowed to indicate briefly the paintings which prove most attractive. Most certainly, one, in Room 8, is "A Fairy Tale," by J. Harland Fisher. It may do the artist good to be told how children love him for this. No. 597, by Walter Osborne, a picture of wife and child, and by the Hon. John Collier, "Trouble."

In Room No. 9 there are two, and probably more, to be noticed. Those who have known Dudley Hardy before, but only as a humorous pen-man, will be astonished, perhaps, to find him here represented by paintings in oil. The first, No. 721, reminds one of a similar painting at Dulwich, which is attributed to Brekelenkam, the Dutch master, and yet more of the modern man, Israels. And this is the same as saying that the painting, in point of treatment and style, is simply a perfect work.

Another most perfect picture which, by virtue of something indescribable, is strangely attractive, is the "Beryl Stone," by Hannah Myers, No. 772. There are other good things to be noticed, but a portrait study in the manner of Rembrandt comes last on the list, No. 328, by Ursula Wood. So modern it is, and yet so exactly like Rembrandt's own Saskia, that we seem to be with her again. It is the work of a painter undoubtedly clever, for Rembrandt was thought inimitable, and we like to imagine her laughing.

It was intended to conclude with a notice in brief of the sculpture, but time has not allowed, and the reader is offered instead our opinion of a single painting, the subject of which being "Sappho," No. 307, might well have attracted the sculptor. Whether we speak of the painter's style or his draughtsmanship, there is probably no abler nude study than this. But is it not better to know what her fate was than to attempt (in the manner of Doré) to realise the condition of the prostrate form that Death claimed when the crags received it? E. R.

ALL SAINTS' CHURCH, Matlock Bank, is to have a reredos, to cost £200, and a memorial screen, of lacquered brass, also to cost about £200.

AUSTRALIAN CAVES.

THE cave systems in Australia annually attract considerable numbers of visitors. The principal caves, those at Jenolan, are easily reached by rail from Sydney, and are the most largely frequented. They are of vast extent and singularly attractive, being remarkable principally for their stalactitic and stalagmitic formations. Among others may be cited the Bell Cave, whence the Belfry, as it is called, is reached, where are six singular stalactites hanging closely together, which, when struck, give out sonorous musical tones resembling a chime of bells; the Lucas Cave, a series of large chambers connected by narrow passages, whose principal features consist in stalagmitic formations of very massive form, a pool of exceeding clearness, a large white mantle beautifully folded, fine "shawls" of semi-transparent stalactite, and

SOME VERY PRETTY PILLARS;

the Imperial Cave, 500ft. high, with its swiftly running underground river, one of the most sensational of cave sights; the Easter Cave, the most beautiful and grandest of them all, and numerous others. There are also several remarkable rock formations in the immediate vicinity of the caves. Among these is the Devil's Coachhouse, a sight which many think finer and certainly more impressive than any of the underground ramifications of the caves. There are also the Grand Archway, the Carliotta Arch, a beautiful natural archway with its span ornamented with stalactites, the Meeting of the Greeks, the Pinnacle Rock, and adjacent woodland scenes. In the Wellington Caves some 250 miles from Sydney, the Breccia Cave is the principal feature, being rich in palaeontological remains, the red ceiling, walls, and floor being literally studded with the white bones of the carnivorous Thylacines and the herbivorous forms on which they preyed. The Yarran-gobilly Caves are situated in the mountainous district lying to the south-east of the colony. Among the many beautiful sights in these are groups of yellow, pink, and green tinged

STALACTITES OF IRREGULAR FORM;

a pillar of stalagmite 8ft. high; a group of stalagmites, which, forming a single mass at the base, gradually taper and separate, until only the central stalagmite reaches the roof; a forest of pillars formed by the union of stalagmites and stalactites, between which are stalagmitic basins full of water; a beautiful mass of stalactites resembling a frozen waterfall; and a chamber, the stalagmitic formations in which recall to mind the spires and turrets of some grand cathedral. The Belubula Caves are situated in the Bathurst district, and are entered by descending vertical pits and proceeding along narrow passages studded with stalactites, the leading feature including a phenomenal stalactite upwards of 6ft. in diameter and 18ft. in length, deeply fluted and resembling the pipes of a large organ; a display of beautiful white stalactites of varying lengths dependent from the ledge around the wall, suggesting the idea of petrified cascades; a couple of stalagmites 18in. in diameter and 6ft. high, pointed at the apex, conjoined at the base and rising from a conical mound of the same formation; some beautiful curtain-stalactites descending from the roof in drapery-like folds gracefully disposed; a white floor with

ORNAMENTAL CAVITIES

filled with clear water, and walls sparkling with calcite crystals. The Wombeyan Caves near Goulburn, are similar in character to those at Jenolan, with which they are supposed to be connected, forming a subterranean passage through the heart of the Blue Mountains. The principal of the Bendithera Caves resembles an immense straight drive into the mountains, and is about 250yds. in length, averaging in width and height 40ft. and 50ft. respectively. Some very fine specimens of dripstone formation, mostly massive, are met with, among which may be mentioned a large slab of calcite, over 20ft. in height by 4ft. wide, and 2in. thick, projecting from the wall in the form of a screen.

A PIECE OF FURNITURE.

By G. LL. MORRIS.

A PIECE of furniture, like every other inanimate thing on which the hands of man have lingered should have, as it were, a soul of its own, derived from the soul of him who fashioned it, to bear lasting witness to the personality of its maker—his intelligence or his stupidity. Sometimes the soul is beautiful; sometimes it is ugly; sometimes it appeals to us with open frankness; sometimes it is full of subtlety and elaboration of concealment. The furniture of the typical suburban residence, for instance, seems to have entered into the conspiracy of its owners to "keep up appearances," as the prime object of existence. Pretentious overmantels from Curtain Road seemed to have been mainly designed as dust-traps for the torment of the conscientious housemaid. Everything that it is possible to drape is swathed in silk, from the piano to the flower-pot and the photo-frame, as though the simple shape of things were something of which to be ashamed; the crowning triumph and pride being an ingenious contrivance by which some article has been constructed to deceive the beholder into supposing it to be something else, as when a receptacle for coals apes a shiny, polished book cabinet. Almost equally disturbing is

in William Morris's delightful description of the pothouse in "A Dream of John Bull."—"A quaintly carved sideboard held an array of bright pewter pots and dishes and wooden and earthen bowls, a stout oak table went up and down the room, and a carved oak chair stood by the chimney corner. . . . That, except the rough stools and benches on which the company sat, was all the furniture. The walls were panelled roughly enough with oak boards to about 6ft. from the floor, and about 3ft. of plaster above that was wrought in the pattern of a rose stem running all round the room, freely and roughly done, but with (as it seemed to my unused eyes) wonderful skill and spirit. On the hood of the great chimney a huge rose was wrought in the plaster, and brightly painted in its proper colours." In this little scene we are far away from modern pretentiousness and artifice, and all the articles described match the lives of the people who use them. *Naïveté* and simplicity are the chief characteristics of mediæval furniture. It is fresh and individual, and often gives one the impression that the craftsman was his own designer, and free to work at his own sweet will. The wood is jointed without concealment in a perfectly natural way. The cool and quaint devices used to overcome difficulties in construction are innocent of deception. Sometimes they might be called unscholarly and even childish, but they show a delightful freshness and resource, and are as frank and straightforward as the social life of the period—direct and unashamed as one of Chaucer's tales. It is only later, as Mr. H. Shaw says in his "History of Decoration in the Middle Ages," when the progress of civilisation tends to make articles of daily use objects of luxury, that we are unable to follow the workman, and to see, with brief examination, just how the article is put together. In the early examples everything had to be done by the ingenious and masterly use of few and simple tools, and beauty of form and execution was instinctively and spontaneously obtained by the way, so to speak. It was rather as a natural growth than something deliberately planned and striven after. Nowadays conditions are altered, and much of the *naïveté* which is charming for its own time and place would be a foolish affectation in modern days. One principle still holds good, however. The requirements and purposes of your building or furniture must make the basis of the design; the design is not to be a foregone conclusion to which the use and convenience of the objects themselves are to be wantonly sacrificed. It is this principle which lies at the base of all true style in Architecture, furniture, and in dress. It is, therefore, foolish to hark back in slavish imitation of what served the purposes for which they were intended admirably several hundred years ago, but which cannot meet the very different conditions of nineteenth-century life. As Mr. Halsey Ricardo tells us, in his Arts and Crafts essay: "That tables and chairs should have lasted a hundred years is indeed proof that they were well-made, and that the conditions of their making were better than they are to-day. Such a re-creation as their due let us hasten to offer. But to take advantage of their survival to increase their number by facsimile reproduction is to paralyse all healthy growth of manufacture." Unfortunately the machine offers a fatal facility for the production of imitations, whether old or new. Cheap and nasty floods the market, and the prevalence in every class of dwelling of imitations whose poor rickety skeletons support a prodigious polish for a brief and fading day, is, perhaps, less due to the taste of the public than the will of the manufacturers. It is the *fiat* of these latter despots which has also decreed "fashions" in furniture, and the fact that such "fashions" exists is surely indicative of the restless and uncomfortable lives of people whose furniture, like everything else, is in a whirling and chaotic state, and whose very armchairs are so unadapted for the use for which they were intended that they can relinquish them almost without a sigh. The conditions of machine production do not, as has been often pointed out, conduce to a high level of intelligence in

the average artisan, and the designer of furniture should bear this in mind to be successful. He must find out the simplest and most satisfactory way of shaping the component parts of a given article; on the one hand, that it may be reasonable in cost; and on the other, that the workmen may be able to make it. Only by such measures can he hope to modify the stupefying sub-division of labour that is entailed in the production of ordinary goods from the warehouse. Some readers may be inclined to cast a reflection on the workman who is unable to design and execute articles that would have been readily undertaken by his mediæval brother. It should never be forgotten, however, that the machine has placed him in a position of mere

A FIREGRATE DESIGNED BY O. B. BRYAN.

MANUFACTURED BY BRATT, COLBRAN AND CO.

the house of the gentleman with antiquarian tastes, who, with a holy horror of Tottenham Court Road and all its works, encourages quite other forms of commercial duplicity. Along with some undeniably genuine pieces of old furniture, he will possess carved oak sideboard and coffer of a suspicious blackness which has more to do with the action of chemicals than the flight of ages; and nearly every chair and table will be a slavish imitation of something "old," without regard to the fact that it may be quite unsuited to modern needs. From so much insincerity and affectation it is a relief to turn to some simple cottage interior, where every article stands in direct relation to the purpose for which it was fashioned. Everything is honest, straightforward, in its place, as

A CLOCK DESIGNED BY E. A. RICKARDS.

subservience, in which he is only the supplementary "hands," called in to supply the offices it is impossible for mechanism to perform. The more elaborate the piece of work, the more machinery and the more hands are employed in its manufacture, and the more unsatisfactory its final effect. As it stands before us it is uninformed by any harmony of thought or feeling. It is merely a soulless conglomeration of pieces of wood fastened together. But we have only to look around us to assure ourselves that a healthy reaction has set in against this slavery to "commercialism" and the machine. An ever-widening section of the public is eager to reject the works of Tottenham Court Road, and to substitute in their place articles that are at one and the same time fit, durable, and beautiful. The fact that there is a growing demand for furniture of the character of that depicted in our illustrations is significant of a spreading demand for real beauty in the homes of many. But the change has to be gradual. We must not grieve too much if chairs and tables such as these are sometimes found in the incongruous company of the ordinary suite. In a stage of transition we must sometimes expect to see beautiful furniture ignobly housed, just as beautiful houses are too often spoiled and desecrated within by glaring anomalies in decoration and upholstery. We may hope that time may remedy this want of harmony, and that the homes of the future may be delightful without as within. In all periods of transition with regard to every branch of Art, there is always danger that

new departures may be overlooked and neglected. Albert Jacquemart, in his "History of Furniture," warns us that valuable specimens of furniture are frequently set on one side. Originality in furniture, as in other things, is in direct relation to new forces in social life, and we shall do well to keep open minds, which will not hastily dismiss new, and it may appear at first sight startling, designs as mere fantastic aberrations, until we have satisfied ourselves that they are not significant of some new manners and customs, or a real re-awakening from within.

Some of us may perhaps remember the story of the unhappy manufacturer who, having warehoused his furniture on the bank of a river, arrived one morning in a time of flood to find his chairs and tables chairs and tables no longer, but a floating conglomeration of pieces. Let us hope that in a not very distant future the tide of public opinion will turn, and show itself just as inimical to the modern makeshift—glue, and that the intelligent craftsman may again come into the kingdom usurped from him by that enemy alike of beauty and durability—the machine in its abuse.

THE "West Australian" and "Niola" have arrived in London, the former with 501 loads of Jarrahdale Jarrah, to the order of McLean Bros. and Rigg, Ltd., 1, Fenchurch Avenue, London, E.C.

In the Consistory Court, the Vicar of St. Mary's, Hendon, has been granted a faculty to remove the gallery over the north-east chapel of that church, and for the erection of a stained-glass memorial window in the chapel.

An inquiry has been held by the Local Government Board into an application of the Darton Urban District Council to borrow £11,500 for the purposes of a sewerage scheme for which plans had been prepared by Messrs. Radford, engineers, Nottingham.

THE new buildings at the London School of Medicine for Women include a large block of laboratories, class-rooms for physics, chemistry, physiology, and anatomy, and smaller apartments for the use of teachers and for private studies and investigations. This addition is but the beginning of a large scheme, to be realised in time, by which the school hopes to have a really handsome and commodious pile of buildings.

LOCHES:

ITS CHURCH AND CASTLE.

LOCHES, with its castle towers and pinnacled church rising amid the masses of foliage which clothe the hill on which it stands, is of especial interest to an English traveller. The massive keep of its castle has often had pointed out its resemblance to the Norman keep of Rochester. The two structures were both built in the latter half of the twelfth century, the one by the side of the Medway some twenty-five years earlier than the other, beneath which flow the waters of the Indre. On my way from the riverside to

the castle (writes a special correspondent in the East Anglian Daily Times) I pass by the Tour St. Antoine, once attached to a church which has been destroyed.

THE TOWER,

which is of the period of the Renaissance, is now used as the town belfry, though it retains its ecclesiastical name. From the foot of the tower I ascend the Rue du Château, on either side of which are interesting houses of the same period as the belfry, until I reach the outer walls of the castle enclosure. This is of vast extent, the circuit of the walls being a mile and a quarter long. I pass through an arched gateway, and speedily see on my left one of the various groups of buildings that are within the castle precincts. At one end is a round tower, connected with a turreted Gothic structure, associated with the name of Charles VII., in contact with which, at its further end, is the Renaissance château of Louis XII., now used as the Sub-Prefecture of the department of Indre et Loire. I wander on to see the great keep, and La Tour Ronde and Le Martelet, two fifteenth century towers, within which it is possible to descend to gloomy dungeons, the gloomiest of all being the lowest or fourth story. In these Louis XI. took delight in keeping in hopeless activity those who attempted to thwart him in his wily policy, and his successors also made the like use of them for those who were traitorous or hostile to them. Within the castle precincts is

A REMARKABLE CHURCH,

which is of unique interest, not only among all the churches of France, but also among all in Christendom. It is Romanesque in its main features; but in France many churches of that style of Architecture have domed roofs, while many others have roofs that are vaulted. If on the map of France a curve be drawn enclosing the area occupied by domed churches, and another be traced around the area occupied by vaulted structures, Loches is seen to lie at the point where the two curves are most nearly in contact, and St. Ours, the church at Loches, is the only instance that presents itself of what may be looked upon as a structure whose style is transitional, between the domed and vaulted varieties. Externally the church has at its west and east ends towers, surmounted by low octagonal spires, while between and in a line with them, in contact almost with each other and with them, are two octagonal pyramidal spires, springing immediately from the roof of the nave. Beneath these there are no ceilings, and when I stand inside the church I

can look up into their sombre heights. These hollow pyramids, with the dim obscurity which veils their upper parts, are the chief peculiarities of this singular church. Beneath the western tower is a projecting rectangular porch, with an abundance of grotesque carved work, and with an ancient Roman altar, in shape a hollow cylinder, used now as a receptacle for holy water, though nearly fifty years ago it was described as being within the church and used as a font. What was once, however, associated with pagan solemnities has clearly undergone a transformation in harmony with the change which has come over human minds. In its present position it adds to the richness of the appearance of the magnificent portal. At the east end of the church is an apsidal projection, in which stands the high altar. Looking eastward from the portal, the succession of massive piers and arches, and the intervening stonework of the walls, have a very impressive effect. On either side of the church are curious side aisles, forming little chapels, entered by narrow doorways. The solemn beauty of the

INTERIOR OF THE CHURCH

has of late years been marred by the rearing up of a huge imitation grotto of Lourdes, in pasteboard and plaster. This, with its tawdry decorations of paper flowers, must shock the taste of those who come to look at the church, which in all its permanent features is so impressive from its strangeness and singularity. From the sacristan's remarks I felt assured that very emphatic protests have been uttered by visitors to the church against the intrusion of the sham rock work into the foreground of the solemn splendour of the church, which has no other like unto it in the whole world. The tower, which is seen at the first glimpse of the castle buildings, is called "La Tour d'Agnes Sorel." It was built for the favourite of Charles VII., and in it she sometimes lived. She was held in singular esteem, both in her own lifetime and in the days immediately succeeding her own, by reason of the influence she exerted upon the king. She is said to have roused him from listlessness, and to have inspired him with the patriotic energy which enabled him to respond afterwards to the still more urgent appeal made to him by Joan of Arc. When she died in 1450 she was brought to Loches to be buried, and a beautiful monument to her memory was erected over her remains by Jacques Cœur. She bequeathed to the church at Loches 2000 golden crowns, besides jewels and tapestry; but these bequests could only be received on the condition that her remains should be

ENTOMBED IN THE CHOIR

of the church. When Louis XI. came to the throne he had the crypt of St. Martin, beneath the church, fitted up for him as an oratory. On one of his early visits to Loches after his accession, the monks—for the church belonged to a college of regular priests—suggested to him that Agnes Sorel's life had not been such as to justify her lifeless body remaining in a position so honourable as the choir of their church. Though Louis had always been unfriendly to the Dame du Beaute, as Agnes was called after her Manor of Beaute, conferred on her by Charles, he replied to the monks that they might place the remains elsewhere. "But," said he, "as you will then be no longer entitled to her bequests, you can restore them to me, especially as they are unworthy to be touched by such pious hands as yours." The monks thought it well not to carry their suggestion into effect, and so did not disturb the mouldering remains. In the reign of Louis XVI., however, the tomb was removed into the nave. Later on it was somewhat despoiled by Revolutionists, but was in 1806 restored and placed where it now stands, in the turret, which, in her lifetime, had been for Agnes an occasional home.

An inquiry has been held at Morley with respect to an application by the Town Council to the Local Government Board for sanction to borrow £40,000 for purposes of street improvements, £2600 for the erection of artisans' dwellings, and £400 for works of sewerage.

A BIRMINGHAM COMPETITION.

PLANS FOR A PROPOSED ASYLUM.

THE Birmingham City Council has just considered a Committee's report on the competition arranged for securing plans for the new asylum at Hollymoor. The Committee invited six firms of Birmingham architects to send in competitive plans, their names including all those who were known to have erected or altered asylums, and Mr. George T. Hine, of Westminster, was appointed assessor. The City Surveyor examined the plans, and reported as to the comparative cost of the designs, the differences proving to be not material, and Mr. Hine spent three days in Birmingham, and supplied a report, speaking in high terms of the merits of the plans as a whole, but stating that no one plan could be adopted without alteration, and discussing in more detail the three plans, with their accompanying descriptions, which he considered to be the best. He subsequently recommended for approval the plan marked "Forward," which proved to be that of Messrs. Martin and Chamberlain. The Committee now propose to authorise that firm to prepare the necessary plans for submission to the Council and to the Commissioners in Lunacy, whose approval is essential before any plans for asylums can be carried out. Mr. Hine's report is appended. He says the designs as a whole display unusual merit, making it evident that the competing architects have very carefully studied

THE REQUIREMENTS OF ASYLUM DESIGN

as well as the Lunacy Commissioners' "Instructions and Suggestions." He has, he says, rarely before advised in a similar competition between architects who are not all experts in asylum construction with so satisfactory designs to report upon. He discovered defects, not at first sight apparent, which made it evident that not one of the plans could be pronounced perfect, or that it could be adopted without some modifications. Whoever the selected architect may be, he must be prepared to remodel his design to some extent to meet the committee's requirements and those of the Lunacy Commissioners. Referring in detail to the plan marked "Forward," Mr. Hine says the administrative department is well arranged, with plenty of light and air, but the steward's stores, boiler house, and laundry are all in one consolidated block, which is not a good arrangement. The entrance and official block is to the north-west, in a fairly convenient position, but would be better if brought nearer to the centre, as this would shorten the main corridor of the approach, which is now common to both male and female patients. The patients' wards show more originality than he found in any of the other designs, and in some respects are very well planned. It is undoubtedly a good arrangement to have all the infirmary wards on the ground floor, but the disadvantage is that wards for more noisy patients have to be placed over them on the first floor. This would necessitate a fireproof floor over the infirmary, so as to ensure perfect quiet. A feature in this plan is the opportunity afforded for future extension, which, although not demanded, is provided for by two blocks which can, if necessary, be erected at any future time without detriment to the present asylum.

POLYCHROME CHURCHES.

By PROFESSOR MEISSNER.

LECTURING before the Belfast Art Society on Polychrome Churches, Professor Meissner referred to the supposed colour blindness in Art of the Greeks, pointing out that that assumption was by no means well founded. When Mr. Gibson's tinted statue of Venus was exhibited a storm of protest was raised by the votaries of this theory, yet it had been subsequently shown that the Greeks had a keen and artistic eye to colour. Greek sculptors studied and reproduced the nude in their works, but the Christian religion objected to the nude, and therefore in the works of the sculptors of the Christian era draped figures instead of nude were the rule. In an

A FIREPLACE. DESIGNED BY C. E. MALLOWS. MANUFACTURED BY J. P. WHITE, BEDFORD.

Early Christian group of the Crucifixion, for instance, the figure of the Saviour was represented as fully draped. The lecturer went on to point out the influence and value of colour in the Art of the Middle Ages, showing that it was used emblematically and figuratively as well as effectively in the application of Art to sacred purposes. In the interior decoration of the churches colour was employed freely, but at the same time judiciously and figuratively. The phrase "dim religious light" was essentially a modern one, for it was the modern glass, not the ancient, which caused dimness in the churches. The old style of glass admitted the light in all its purity. As showing the wonderful influence of colour in Art as applied to sacred purposes of the Middle Ages, the lecturer quoted from a work published by a priest of the Middle Ages, under the title of "Theophilus Presbyter," which gave minute directions to the architects of his day for the decoration of churches from the emblematic point of view. Every colour had its figurative meaning. Green was symbolical of youth, red of love, blue of celestial things, yellow of the baser passions of human nature, violet of wisdom, and black of things infernal.

INTERIOR LIGHTING.*

REFLECTED LIGHT ESPECIALLY CONSIDERED.

BY W. ECKSTEIN.

THE treatment of light, or the proper distribution of daylight to any building, is of greater importance than anything else, except, perhaps, drainage, and daylight assists largely in the sanitary conditions and cleanliness of all buildings, whether for offices or warehouses. It is a common saying that "dirt cannot stand light," and when it is borne in mind that daylight is available to all and costs nothing, it is a great pity not to utilise it to the utmost extent. This should be done by covering any particular site so as to obtain the best result from the open air and direct daylight, and to assist same by the use of artificial means or devices, such as reflectors, pavement lights, &c. Daylight necessarily is brought in through the windows, and the light that enters the room falls on the floor at an angle up to about 45 deg., where it is nearly all absorbed, and consequently does not produce the full effect that is required for all offices. The arrangement of windows, of course, lends itself to assist or detract from the result obtained, and it will be found well to keep the head of the window as near the level of ceiling as possible, at any rate, not to be more than 12 in. below it. The part of a window is practically of little effect if brought within 2 ft. of the floor level.

The window should be placed so as to give an equal margin of wall on either side as near as possible, and the length of an office should not exceed about twice the height of the head of the window from the floor, which in the ordinary way would be a limit of about 16 ft. to 20 ft. The general depth of an office should be taken about 16 ft., as beyond that distance light is not generally good, and the extra space loses value, and there is a point where the extra size or depth can only uselessly increase the size of an office, and not produce its proportion of rent. A useful rule for the size of windows is that not less than one square foot for every 85 ft. of cubic space, and not less than one square foot for each lineal foot between the window and opposite wall inside should be given. Of course, all such rules would be varied by circumstances, as to whether on the ground, first, or any other floor, and also from what direction the light can be obtained. And generally the height of a window may be half the depth of a room, less 2 ft., and the width of a window one-third the width of a room.

Good, pleasant daylight is of the first im-

* Paper read before the Architectural Association on Friday night.

portance, and there is a general difference of opinion as to the proper aspect for this. Some hold that only the north light is good, while others that no building is well planned that is not so arranged that there is a little sun in each room during a part of the day. The latter opinion is certainly the best, and although this is a difficult problem, when the irregularity of the streets and frontages in most towns, and the height of adjacent buildings near are so very variable, under all circumstances it is better to lay down what is the best direction for the daylight to reach the windows on any site, and this, of course, can be more readily arranged on a fairly rectangular site. The first point to decide is the best axis for the open areas or well openings. Take the average day, and suppose that the sun rises at six (see diagram), 6 E. will equal six a.m., and 6 W. will be six p.m. The usual hours of business are, say, from nine to five, and then the angle, 509, if bisected, will divide the hours of sunlight equally, and it is this line which should rule the direction of the greater length that open areas and well holes should have. This will be found to be 15 deg. east of north.

The open area or court should be made rectangular, not square, and lengthways, north and south. If the line O O be taken as 15 deg. east of north, a well hole should be formed as A B C D. A portion of sunlight (every day that the sun is visible at all) would go into all the windows in the walls, A B, B C, C D, during each day, and in some seasons reach the bottom of the well hole, and, at any rate, it would reach the maximum distance at all times.

If you have followed this proposition carefully you will at once see that if in any town the roads have this direction of 15 deg. east of north, and the cross roads at right angles to them, then will be a great advantage. This is not often to be gained, but it has been noted that this happens to be near the prevailing direction in New York City, and the advantage must be considerable, although it will not be apparent to many.

Following up the proposition of the proper axis for open areas for obtaining the best and most useful daylight to buildings, I have taken the two sets of drawings and following remarks from the Architectural Record, December, 1893, and June, 1894. The conditions for a successful building for use as offices are:—

- I. Ease of access.
- II. Good light.
- III. Good service.
- IV. Pleasing environment and approaches.
- V. Maximum rentable area consistent with economy.
- VI. Ease of rearrangement to suit tenants.
- VII. Minimum cost with true economy.

The plans A and A A show two buildings as erected, and B and B B as it is suggested they should be.

For good light, experience confirms the statement that courts should have their long axis north and south. In the plan A it will be seen that the court is of irregular shape, but with the long axis east and west, and while the court area embraces 150 square feet more than in the plan B (as we say it should be), yet its service in lighting is decidedly less. The rentable area in B is apparent, and the fact that it is possible to have fourteen different tenants on each floor, instead of five as in A, is a consideration which would enhance

the value of the building, if erected as suggested. The arrangement in the plan B gives an area of 220 square ft., or about 10 per cent. more than in A. The other illustrations in comparison are made on the drawings A A and B B.

As to the arrangement for good light, it is generally accepted that the requirement is that every portion of the office should be within 20 ft. to 25 ft. of a window, and that that window should not open directly to the south. It is to be hoped that the disadvantages due to the direct south light to an office will soon be appreciated, and the advantage of a court or open area, with its long axis north and south, more fully understood. Offices, on a bright day, facing to the south have to have the blinds partially closed in order to reduce the glare from the sun, the consequence being the back portion of the office has to be lighted, possibly by gas or other means. The corridors in the plan B B, as suggested, would be sufficiently light with glass in the doors, and fanlights over. The comparison of these two sets of plans, showing buildings as erected and suggested, are presented as having a considerable bearing on the matter under discussion, and is also a subject in which architects in particular are so greatly interested.

Upon valuable sites, where the amount of available daylight is very limited, it is necessary that the least possible space be appropriated as mere open areas for light. To show the difference of opinions on this matter, Mr. Boulton, of Liverpool, compiled the accompanying table, which speaks for itself, comparing the different areas so appropriated in five different competitive drawings submitted for the new Stock Exchange, Liverpool, about fifteen years since. The plot was 49 ft. to Dale Street, depth 197 ft., back width 36 ft., and the total area 9195 ft., the only street outlet being Dale Street.

COMPARISON OF SPACE SACRIFICED FOR LIGHT.

Designs.	Basement.	Ground Floor.	First Floor.	Second Floor.
Argus	323 ft. 1 in 28'4	570 ft. 1 in 16'0	1030 ft. 1 in 8'9	1950 ft. 1 in 4'7
Grand Trunks	None.	4121 ft. 1 in 2'2	4121 ft. 1 in 8'2	4121 ft. 1 in 2'2
Shamrock	45 ft. 1 in 204'3	269 ft. 1 in 35'3	1822 ft. 1 in 5'0	3097 ft. 1 in 3'0
Coupon	None.	390 ft. 1 in 23'5	2283 ft. 1 in 4'0	2213 ft. 1 in 4'0
1877	None.	1186 ft. 1 in 7'75	1380 ft. 1 in 6'6	2859 ft. 1 in 3'2

It may also be useful to compare the rent-producing area shown:—

RATIO OF SPACE YIELDING RENT TO THE WHOLE AREA OF SITE.

Designs.	Basement.	Ground Floor.	First Floor.	Second Floor.
Argus	1 in 3'9	1 in 2'32	1 in 1'88	1 in 2'14
Grand Trunks	1 in 1'6	1 in 1'26	1 in 2'23	1 in 1'70
Shamrock	1 in 2'24	1 in 3'0	1 in 1'94	1 in 2'60
Coupon	1 in 1'76	1 in 2'30	1 in 1'75	1 in 2'35
1877	1 in 1'9	1 in 2'97	1 in 1'66	1 in 1'54

Notwithstanding the proper arrangement of well-holes and light openings in the lower floors, it is necessary often to assist the daylight by reflectors. These are so generally known, and their good effect so considerable, that it is only advisable to point out that where possible the reflectors should be fixed at the sill instead of half-way up the window, and be exposed directly under the sky, and the light should be thrown up to the ceiling of the apartment, and if this is polished in hard plaster it will greatly assist to distribute the light throughout the room. Where volume of light is required direct, light should be admitted vertically. The light passing through a skylight is very much greater than that through any vertical window, and consequently the light received from the horizontal pavement light is much stronger than from a vertical stall-board.

It is hardly necessary to dwell on the difference of reflection and refraction, but it should not be overlooked. All rays of light move in straight lines, and when they strike upon any object they glance off its surface, are wholly or partially absorbed, or pass through the object, as in a sheet of glass or a body of water. In the first place, the light is said to be reflected, and in the others refracted, because its course is partially diverted from the right line in which it left the luminous body, and its direction bent or broken back according to the difference in density between the two media.

The direction in which light is reflected depends upon that from which it proceeds; it is always such that a perpendicular to the surface at the place of impact bisects the angle formed by the arrival and departure of the ray. Each half of the angle represents the angle of incidence or the angle of reflection; those angles are always equal, and always in the same plane, one being known, the other is readily ascertained. The perpendicular is termed the axis of incidence, the first ray the incident ray, the other the reflected ray. It is by the reflection of the rays impinging upon them that objects become visible, and the reflective powers of the objects are very variable. At a perpendicular incidence, water reflects only eighteen rays out of every 1000, and glass only twenty-five, while mercury reflects 666. When the rays strike the surface obliquely, the reflection is augmented; at an incidence of 40 deg. water reflects twenty-two rays, at 60 deg. sixty-five rays, at 80 deg. 333 rays; while at an incidence of 89½ deg., where the light almost grazes the surface, it reflects 721 rays out of every 1000. Thus, as the obliquity increases, the reflection of water approaches and finally overtakes the reflection from mercury, but at no incidence, however great, is the reflection from water,

mercury, or any other substance total. Any beam of light meeting any refracting surface obliquely, it is obvious that one part of the beam will meet it before another; it is thus hindered in its motion by it as wind is hindered, but not stopped, by the trees.

Trace a ray A B (Fig. 41) to the refracting surface C D, marking off the assumed length of its waves by the transverse lines. The front will be retarded at E before it is retarded at F, and we may assume the retardation is such that the wave in the denser medium is only propagated to G, while in the rarer medium it reaches H. It is plain that the beam must swing round, but when the side F also reaches the denser medium at H, the whole will be retarded alike, and the beam will proceed as before, only slower and in a different direction.

As the beam emerges from the denser medium, the reverse of what has been described occurs, and, provided the refracting medium is of uniform density and thickness, the beam of light proceeds in a path parallel with its former course. In lenses and prisms the emergent beam takes an oblique path, and in the case of lenses either convergent or divergent (according to the kind of lens), and the position of the lens relative to the object. In Fig. 42 the upper side of the beam of light is still further retarded, and therefore the beam must swing round again, and pass out in quite a different direction to that of entry, so that a beam of light passing through (a prism) is permanently deflected. For example (Fig. 43), the sun viewed through a prism, as shown, will appear to the observer in a lower position; the light in this case is twice refracted—once on entering the glass, and again on leaving it.

The principle on which the measurements of refraction are based was discovered by Willebrod Snell, and is explained as follows:—Let W X Y Z (Fig. 44) represent the outline of a circular vessel containing water, and X Z the surface of the water. When the ray is incident along W C, perpendicular to X Z, it is not refracted, but reflected on the same line; when it is incident along A C, it is refracted at C, and strikes the circle at a; when it is incident at B C, it is refracted to b. From the ends of the incident rays let A A and B B be drawn perpendicular upon W Y, and from the ends of the refracted beams let the perpendiculars a a and b b be drawn. Measure the lengths of A A and a a, and divide the one by the other, and there is a certain quotient. Divide B B by b b and they give the same quotient—that is the ratio between the sines of the angles of incident and the sines of the angles of refraction is constant. Snell found this quotient to be a constant quantity for each particular substance, though it varied in amount from substance to substance. He called the quotient the index of refraction.

According to Brewster, the index of refraction is—

For glass, two of lead to one of flint ...	1.830
Plate glass ...	from 1.514 to 1.542
Crown glass ...	from 1.525 to 1.534
Water ...	1.336

In comparing the lenses used in pavement lights I assume the index to be 1.5; therefore the angle of refraction, on entering glass from the atmosphere, is two-thirds of the angle of incidence, and on leaving the glass it is half as large again.

Referring now to the lenses and prisms that are most useful in pavement lights and stall-boards, shop fronts, offices, windows, &c., the first kind of glass probably used in decks or floors was undoubtedly the common "ship's deck light," which is a solid mass of glass with a flange all round to support same in the adjoining floor, and with a heavy drop or triangular wedge on the under side. Whether this drop was originally intended for strength, or for increasing and distributing the light, is doubtful; there is no doubt about the strength, but if you look at the lens on the diagram (Fig. 1) it will be seen that all the vertical rays are reflected outward again from the sloping faces on either side. We now take practically the same block of glass (which for our purpose is cut in two) and open it outwards, and you will at once see the

marvellous result, and it is this principle which has been the foundation of "Haywards' patent semi-prism pavement lights," Figs. 2 and 3. It will be seen that the vertical, or nearly vertical, ray is thrown out through the upright, or nearly upright, front of the lens at an angle a little below the horizontal, and the rays falling on the top of the lens at various angles (Fig. 52) are thrown out in a fan shape, and the steeper the back slope, with the nearly upright face a little more inclined (as in Fig. 3) projects the light lower than in Fig. 2. Of course, such an important result, which can be obtained from a series of prisms grouped in a frame as a pavement light and protected by a patent, has been attempted by various other devices or sections of lenses, as in Figs. 4, 5, 6, and 7. The result is generally bad, and that the makers of such lenses should have been given a certain amount of encouragement by architects using them shows to a certain extent the comparative neglect in deciding such an important matter as to which is the best kind of pavement light for producing the best illuminating effect in any building.

It will be seen, too, from sect. 11 that some thought is required in assembling the lenses in a properly constructed frame, so as to produce a satisfactory result. Section 12 is an attempted improvement on sect. 11, but unfortunately there is a great difficulty in making such irregular shaped lenses perfect, when one part is so bulky and another so thin, on account of the inequality of the glass and tension in the lens, therefore this lens in practice is a failure. This tension also limits the size that can be safely made. Fig. 13 is a neat arrangement of a small prism in each pocket, and may be often of use when the area of pavement light can be large.

Now, coming to the vertical lights used in stall-boards, or applicable to shop fronts, windows, &c. The lenses used are "Haywards' reflecting lens" (as in Figs. 21, 22, 23, 24), which are made at different angles to suit different circumstances. Such lenses are usually employed under the shop or office front, and the application is better explained in Figs. 36, 37, 38. In plan Fig. 33 and section 31 and 32, the combined arrangement of pavement lights and stall-boards will be clearly understood. It should be noted that if any girder be introduced (as shown in dotted lines x, x, x in Figs. 36, 37, 38) a very considerable portion of the light would be lost, and a heavy shadow would be cast along the ceiling. Pavement light should be supported by bearers transversely, and as little obstruction or thickness of metal be introduced at the junction of the vertical stall-board with the horizontal pavement light, and this is easily arranged by turning up the

back edge of flange as shown in sections 11 and 13, which is generally called a "water bar."

The frames of the upright or stall-board lights are sometimes made with rebates to the horizontal bars only or vertical bars only, and, in others, with a perfectly plain sectional bar without any rebate, with a small button at the intersections to retain the glasses in their position. See Figs. 39, 40. Diagrams E and F are general sections of a basement and front, in which it will be seen that a combination of several devices, as already more or less explained, can be introduced to such an extent, either single or combined, as may be desired. It will be seen that the upper portion of the windows can be glazed with the reflecting stall-board lenses, to throw the light to the back portion of the ground floor in almost a horizontal direction, or to throw the light slightly upwards on to the ceiling, and thereby illuminate the back portion of the office.

In the diagram (E) it will again be seen the great disadvantage of running any transverse girders or beams below the level of the ceiling across the direct line of light. These girders or beams would throw heavy and objectionable shadows, so that the ceiling, instead of being light and bright, would be shadowed, and the major portion of the reflected light lost. Under the stall-plate stall-board lights can be fixed vertically as in the window above, and in the pavement light, "Hayward's Semi-prism Lenses," fixed horizontally, and these pavement lights could throw the light on to a stall-board light, fixed as shown when a partition is advisable to divide off the front part of basement, and this would throw a volume of light into the basement. In the other sectional drawing, F, the ordinary daylight reflector is introduced at window sill on first floor, and near the middle of the depth in well hole a series of pavement lights and stall-board lights to throw the light all round same are introduced, the arrangement of lenses throwing reverse ways should be noted. It will be seen that one or two of these plans can be adopted with more or less advantage.

Many modifications suggest themselves to architects and others, and with the information called for in diagrams 01, 02, 03, the best arrangement can readily be worked out. It will be noted that when light is obtained from definite sources, it must be taken to act in some line of greatest volume, and referring to the diagram 01, the best light falling on the pavement light at "D" will be at about one-third of the angle made by the front of the building, and the line of light from the coping of the opposite building, or in the direction "x," and from the stall-board lights at about two-thirds, or as direction "z." Again, if the street is very narrow, and a high building directly opposite, the light can be usefully assisted by such lenses as Figs. 26, 27, and 28.

In all cases, the tops of the lenses of pavement lights and front of stall-board lenses should be plain flat surfaces and kept clean. However, ornamental effects can be given, but this is generally done with a proportionate reduction or waste of light. Also a more ornamental appearance can be given by tile inlays between the lenses of pavement lights, or a good foothold by a non-slipping material, such as lead, cement, facing, &c. Specimens and samples of such lights are numerous and difficult to show to advantage away from the factory, on account of their weight, and where also they can be seen in position. In conclusion, I would add that an effective result can only be produced with the fullest information being supplied, as in the diagrams 01, 02, and 03. They should be carefully examined, so that every advantage may be taken to fulfil the particular result desired.

The Chairman (Mr. Hampden W. Pratt), opening the discussion, said that the question of light, and what could be done by reflecting light, was a very large one, and there was no doubt it had not developed to anything like the extent to which it was possible. A subject like this was more interesting and more applicable to architects practising in a large city like London than in any other part. On account of the value of land in the City they

had very narrow thoroughfares, which naturally suggested the use of reflected lights. When they looked into the question, they found it was an extremely scientific one, and it required a considerable amount of ingenuity in order to work out thoroughly a scheme to obtain the best results from the use of the lenses. In the narrow thoroughfares of the City, especially where the buildings were warehouses and large places of business with large areas for lighting, there was, as they saw in the Cripple-gate fire, great sources of danger. If the question of reflecting light could be more closely studied, and reflectors used to the extent which they might be, there was a great possibility of doing away with these dangers. He had had an opportunity of visiting a building in the City, at Hill Street, Finsbury, where he saw reflectors employed on a scale that he had never seen previously, and it would interest architects if they went to see the premises. The system there would show what could be done, for the light the reflectors brought into the basement was really most remarkable. It was also claimed that the system adopted there could be used not only for basements, but for any other place in the upper part of a building by reflecting the light right to the back rooms, and so on. We had never used this system in this country in that way, but it had been carried out in Chicago to a large extent, where some of the finest buildings had been lighted in this way.

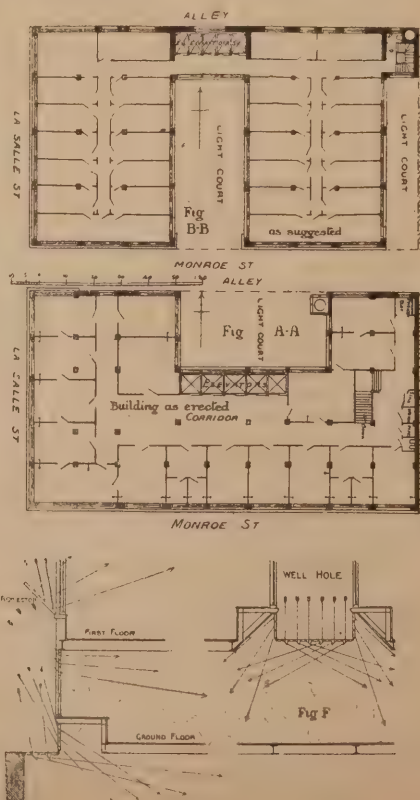

Mr. Banister F. Fletcher, proposing a vote of thanks to the lecturer, described the paper as being most valuable to architects, as it really amounted to a large extent to some practical treatment of the law of architects as affecting Architecture. The lecturer had given them a plan of areas as effecting the requirements of light, and referred especially to the two methods—one carried out and one suggested—for a building in Chicago. He happened to know the writer of the article quoted, and never could agree with his scheme. As suggested, the area was shown north and south. That, of course, was an excellent way when they could get it; but they had to work in areas as best they could. He had never seen the suggestion for using reflected light on upper floors carried out. He imagined it would be a very good treatment, but it would cause some inconvenience because of the necessary leaning of the lights.

Mr. F. G. H. Hooper, seconding, said the question of lighting was not confined to Architecture in the City, but it affected every building and window architects contrived. If

they compared the buildings street for street, they could realise some of the causes which made one street dull and another cheerful, and understand what led the fashion. It was novel, perhaps, to draw attention to Bond Street—which was such a favoured rendezvous—to compare it with a thoroughfare like Victoria Street. The one had an abundance of sunlight, and the buildings on either side enjoyed that advantage, while in the other the direction was east and west, and the sun struck down along it at very short intervals through the day. The lecturer had shown by the diagrams how the areas should be constructed if it was possible. Mr. Fletcher said the exigencies of many sites made it extremely difficult to carry out the principle exactly, but he (the speaker) thought if they had the principle in mind their plans might often be affected by the rules laid down by the lecturer. In regard to diffusing light, Mr. Eckstein had confined himself to two methods of lenses, which he had made a study of, and which were so much associated with his name. But no doubt many had noticed how glass with an irregular surface would distribute light in a room where clear glass failed to do it. The glass he had used of late was called mottled glass, and it was a very simple means of increasing the light in a small or large room where the window space might be small. If the clear glass was replaced by this with the irregular surface, they would notice how it carried out the rules the lecturer had illustrated, by conveying the light in certain directions and distributing it in many angles into the room.

Mr. Max Clark said he gathered from the remarks of the lecturer that he inferred stall-board lights were not so effective as floor lights. He would like to enquire what percentage of light was lost after six months traffic over the latter, and whether stall-board lights did become much more effective?

Mr. W. Eckstein, acknowledging the vote of thanks, said pavement light glass, of course, required cleaning. Although lenses did not require to be cleaned more than occasionally—say once a fortnight—of course, if they wanted light anywhere they must look after the glass a little. With reference to the wearing, he would like Mr. Clark to see the result of some lights that had been in use fifteen years. It was really astonishing to see the light they gave, after having worn down an eighth of an inch. They must bear in mind that the light came upon them vertically, and that was a great advantage.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
May 11th, 1898.

"I know what it is to live in a cottage with a cool floor and roof, and a hearth of mica slates; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but say this, emphatically, that the tenth part of the expense which is sacrificed in domestic utilities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the places to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE Royal Academy contains 1967 exhibits; 105 oils, 250 watercolours, 199 miniatures, 12 architectural drawings, 161 pieces of sculpture, 139 etchings, drawings, and engravings, and the address presented last year to Her Majesty by the Academy. The number of contributors this year is 1298—984 of whom are men, with 1534 works, and 314 women, with 433 works. Nine Academicians and Associates have sent nothing to this year's academy, but the other R.A.'s and Associates are contributed about 200 works. Mr. Sargent has the distinction of having sent the largest number of contributions, namely, eight; while Messrs. Herkomer, Goodall, Onslow Ford, Hacker, and Macbeth sent six each; and Messrs. Brock, Oulless, Hemy, Shannon, and Vyllie five each.

THE most coveted position which any artist outside the ranks of the Academicians can aspire to at the present time is a place on the line in the Burlington House Exhibition, and here are few of the thousands of artists who have contributed works who have not seen a vision of their picture in that position and who consider themselves most hardly treated if they do not attain to it. All such have but a little notion how slender their chance is, or the amount of space which is open to them after the fifty painters who constitute the elect contribute have satisfied themselves. We were at the trouble this year, says the *St. James's Gazette*, to count the pictures actually on the line in two of the rooms, and mark who they were by. In the large gallery forty are hung; of these thirty-five are by members of the Academy, and of the remaining five three are by foreigners, leaving two for British outsiders. In the first room the total pictures on the line are twenty-eight, of which even only are by outsiders. The Academicians do not exercise their full privileges (Mr. Sargent alone shows eight works, and the fifty painters between them contribute an average of under four each), or there would be no space whatever on the line for outsiders.

THE old glories of Chiswick are rapidly departing. Not long ago the picturesque old red-brick Manor House was pulled down to make room for unlovely little houses; Chiswick House itself, with its memories of Fox and Lanning, has been converted into a lunatic asylum; while still more recently, Rupert House, which is said to have been the headquarters of Prince Rupert at the time of the battle of Brentford, has had to make way for shops. Now Mawson House, in Chiswick Lane,

not many yards away from the vanished Manor House, is about to become the Fox and Hounds public-house, the license being transferred from the adjacent building of that name. It was at Mawson House that Alexander Pope resided before he removed to Twickenham.

THE Prefect of the Seine has found it necessary to check individual enterprise in the building and decoration of Paris. He has appointed a technical committee of artists and architects, and other competent judges, to whom all plans affecting the aspect of the city must be submitted for approval. Surely, says the *Globe*, it is a body of this kind that London wants. Enormous sums and much architectural skill are expended on individual buildings in London, but they are designed and erected apparently without the slightest regard to the style of buildings which adjoin them, or the aspect of the whole street or place. Hence the general effect of the streets is poor, irregular, unimposing, and freakish. London might be a fine city, but it will never be so, however much money be spent on it, until regard is paid to the whole, and the caprices of individual taste or the dictates of the purse are controlled by an authority representing artistic and architectural requirements.

It was suggested at a meeting of the Welsh Calvinistic Methodist Association that a competent architect should be employed to inspect the plans of all new buildings, and it was pointed out that there was great need to pay attention to beauty as well as utility in the construction of places of worship. Everyone who has travelled in Wales must have observed the painful contrast between many of the chapels and their surroundings. Turning the corner of some delightful valley, the visitor continually comes upon a Zion or a Bethesda which suggests anything but the beauty of holiness.

THE Select Committee appointed to inquire into and report upon the administration and cost of the museums of the Science and Art Department have agreed to a first report, in which they state that they are unanimously of opinion: (1) That the whole area on the east side of the Exhibition Road (except that occupied by the Royal College of Science, which cannot be sacrificed except at great cost) be exclusively devoted to the art museum and the art library, with provision for the conduct of the business connected with loans of art objects and the art schools. They are satisfied that the whole of this space is required for the art schools, the due exhibition of the art collections, and the administration connected with such a museum; and (2) that provision for the whole of the science collection, the science library, for loans of scientific objects, and for the science schools be made on the west side of the Exhibition Road. They also unanimously recommend that the Geological Museum in Jermyn Street be no longer occupied for the same purposes as now; and that the collections there exhibited be removed to the west side of the Exhibition Road, and made part of the science collections.

AT the Great Pulteney Street Galleries a beautiful exhibition of artistic furniture has been arranged by Messrs. Cooper. The most noteworthy feature is an entire drawing-room suite in the style of the First Empire. The tables, chairs, and sofas are of Spanish mahogany, decorated with elaborate brasswork in different classical designs. The handsome overmantel is of the same character. The framework of the mirror is perfectly plain but for the brasswork decorations. The influence of the enthusiasm which prevailed at the time for everything classical is plainly seen both in the design and decoration of the furniture. The chairs and sofas are upholstered in yellow brocade, with a wreath pattern. Among other interesting articles in the exhibition are the specimens of sideboards, cupboards, and other articles in the Old English style. These are made in oak, darkened in colour by a

process of fumigation, but not varnished or stained in any way, and hinges, handles, and ornaments are of polished copper. Some fine oak panelling is also to be seen. Among other antique treasures are a quaint Sedan chair, some carved Italian easy chairs, and a carved sideboard of the time of Louis XVI., with a heavy marble top. A number of beautiful examples of English silks and brocades show that the weavers of Spitalfields can compete successfully with the French manufacturers.

THE Lowther Arcade is to be sold at public auction this month. It will be offered, together with the two immediately adjoining houses on either side in the West Strand and two in Adelaide Street, in a single lot, at the Mart, by Mr. G. B. Smallpeice, in consequence of the death of Mr. William Bird, by whom it was leased from the Crown. The lease has yet rather more than thirty years to run, and the rental it produces is about £4000 a year. Of course, the future of the Arcade will depend upon the purchaser, and all predictions as to the ultimate occupation of the site—which range from a huge new store to a theatre, from blocks of offices to a restaurant—are purely surmise. The Lowther Arcade is not so old as its more fashionable rival the Burlington, which was built for Lord George Cavendish in 1819. Not till twelve years later was the one at Charing Cross set in hand, and was part of an immense scheme of improvement carried out under Lord Lowther, then Chief Commissioner of Woods and Forests, after whom it was named. Its architect was Witherden Young, and though probably not one in a thousand who visits it takes a glance upwards, it is not without a very considerable dignity and grace of outline. In length it is just 245ft., and there are in all five-and-twenty shops, each of which has a basement, a ground and first and second floors. London, however, has never taken kindly to arcades, and at best has accorded to them but limited favour. In Paris there are some twenty of them, many roomy, commodious, and popular as promenades, and those of Milan also are famed, but the old Exeter Exchange outlived its repute, and the only one that has been constructed of recent years is the very short one running from Bond Street to Albemarle Street. Brixton is, of course, the possessor of a handsome "Electric Avenue," which offers a pleasant possibility of studying the shop windows, independent of the weather, but for some inscrutable reason no arcade seems fated in this country to be for long a really favourite centre, either for business or for merely lounging, an art which the true Briton has certainly not yet acquired in Continental fashion.

THE long-promised new bridge at Kew is now on the way to become an accomplished fact. The local authorities, as well as the Thames Conservancy, have approved the Bill promoted by the Middlesex and Surrey County Councils, and the only opponent heard before the Select Committee was the West Middlesex Waterworks Company, which claimed an indefeasible right to lay pipes across the new bridge. The Committee unanimously found the preamble of the Bill proved, and rejected the demand of the water company.

IN the Consistory Court, an application has been made by the Rev. James Pulleine Thompson, vicar of Christ Church, Chelsea, for a faculty authorising certain alterations in that church. It was explained that it was desired to extend the chancel, to build a choir vestry and a clergy vestry and an organ chamber, to take into the church a space at present occupied by a porch, to construct two new porches elsewhere, to extend the front of the church, and to altar the galleries by lowering the front seats. There was also a proposal to build a church room on land adjoining the church given by Earl Cadogan. The alterations would cost from £3000 to £5000, of which £2500 was already in hand. The Chancellor decreed the faculty as prayed, being of opinion that the several alterations would greatly improve the church, and tend to the convenience and safety of the congregation.

AN INGLE FIREPLACE. DESIGNED BY C. H. B. QUENNELL. MANUFACTURED BY J. P. WHITE, BEDFORD.
IN ILLUSTRATION OF "A PIECE OF FURNITURE."

IN ILLUSTRATION OF "A PIECE OF FURNITURE."

In an article on "The Plumbers' Registration Bill" the *Lancet* says that "the amended draft of this Bill will, it is hoped, remove the regrettable opposition which the Bill has hitherto encountered. It is deserving of notice that the Worshipful Company of Plumbers have shown an unusual amount of public spirit in its promotion, and of tact in their endeavours to overcome opposition, and to present an effective measure thoroughly in accord with the wishes of the plumbing trade as a whole, while at the same time one which should meet the susceptibilities of other existing bodies interested in technical education. In a measure of this kind unanimity is essential to success, and powers are to be granted to the proposed Council to accept the examination of certain approved bodies as qualifying for registration, provided—and this is a most important clause—that such examinations shall include practical tests of workmanship in addition to theoretical knowledge.

EXCEPTION was taken last year to the constitution of the proposed General Council and to its assumption of educational functions, which objections are met by the present Bill. The Council in the present Bill is composed of master and operative plumbers elected under regulations of the respective Local Government Boards of England, Scotland, and Ireland, while power is given to the Council to appoint members from various sanitary, architectural, and other bodies, the following being mentioned in the schedule: the Incorporated Society of Medical Officers of Health, the Royal Institute of Architects, Ireland, the Royal Institute of British Architects, the Royal Institute of Public Health, the Sanitary Association of Scotland, and the Sanitary Institute, London. A measure, the object of which is one so closely associated with the improvement of the public health, is deserving of support from all sections of politicians. Unfortunately it is difficult to get the plumber taken seriously. He has so long been a target for weak and threadbare jokes that the most modest of wits is tempted to have a passing shot at him. It might, however, be well to bear in mind that there are hundreds of these men at work throughout the country, the result of whose daily labours means health or sickness, life or death, to thousands of their fellow creatures annually. The desirability of ensuring in them some measure of efficiency may surely be considered a matter worth serious attention."

MESSES. SOTHEY, WILKINSON, AND HODGE recently sold a collection of valuable engravings by masters of the English school, 121 lots realising the high total of £1216 2s. 6d. The more important were the following After George Morland:—"A Tea Garden" and "St. James's Park," by Soiron, in colours, margin relaid, £43; "Morning Amusement" and "Rural Employment," by J. R. Smith, finely printed in colours, 61 guineas; and the First of September "Morning" and "Evening," by Ward, finely printed in colours, £34 10s. "A Snake in the Grass," after Sir J. Reynolds, by J. R. Smith, finely printed in colours, £28. The following after G. Romney: "Mrs. Carwardine and Child," by J. R. Smith, first state brilliant impression, £116; and Louisa Lady Stormont, by the same, fine and very rare, £50. The following after J. R. Smith: "Thoughts on Matrimony," by Ward, in colours, £60; and a brilliant impression of "The Promenade at Carlisle House," £46; and a fine and complete set of thirteen, printed in colours, of "The Cries of London" series, after F. Wheatley, £300.

THE Executive Committee of the Imperial Institute are making arrangements for holding at the Institute an exhibition of apparatus and appliances for the generation of acetylene gas and its applications for lighting purposes. In order to ensure that no apparatus be admitted unless it has been proved to fulfil the requisite conditions of safety, the Council of the Society of Arts has appointed a practical committee to decide upon those conditions, and to lay down rules for the admission of apparatus. All apparatus intended to be shown in operation will be tested prior to admission. This is

intended to show which generators are so constructed as to be safely admitted to work at the exhibition, and does not imply any special approval on the part of the testing committee. It is intended that the exhibition shall commence on the first of June, and continue open until the end of August. Applications for space should be sent in at once.

At the Guildhall, before Mr. Alderman Smallman, Mr. J. Husbands, Basinghall Street and London Wall Avenue, was summoned at the instance of Mr. Edmund Woodthorpe, district surveyor for the northern division of the City, for that between December 21st, 1897, and January 5th, 1898, he did counsel and procure one James Atkinson Spencer, of Commercial Road, Lambeth, to contravene a section of the Building Act, 1894, by making an opening in the party wall used for the separation of 4, London Wall Avenue; James Atkinson Spencer, builder, was summoned for contravening section 77 of the Building Act by uniting 45A and 46A, Basinghall Street, with 4, London Wall Avenue.—Mr. Horace Avory, prosecuting on behalf of the London County Council, said the Building Act of 1894 was passed for the very purpose of protection from fire, and since the great conflagration in Cripplegate the importance of the matter now before the Court could not be over estimated. The complaint was that an opening had been made in these buildings—buildings which were not in one occupation, and so uniting what were practically two buildings, thus contravening the Act. Mr. Woodthorpe, the district surveyor, had been asked to give his sanction to this opening being made, but he had refused, and then, advantage being taken of the last Christmas holidays, a door was made on the second floor. No building could be so united legally except if it were wholly in one occupation or adapted to be so, and evidence would be given to show that it was not.—Mr. Edmund Woodthorpe, the district surveyor, stated that the whole of one of the buildings was in the occupation of Mr. Husbands, but the ground floor was tenanted by Messrs. Singleton and Bender. On December 21st he found a party wall had been made on the first floor, thus connecting Nos. 45A and 46A, Basinghall Street with 4, London Wall Avenue. He had never given his consent to this.—Mr. Elliot, on behalf of the occupier, contended that there was no uniting, because these buildings were practically one, and there was no party wall.—Technical evidence having been given, Mr. Benjamin Housgood, the original builder and owner of the premises, said they were built as a speculation, to suit either one or more tenants.—The case having been argued, the Alderman said: I find as a fact that these buildings were constructed and adapted so as to be wholly in one occupation, and therefore I shall dismiss the summons. I think the case has been very properly brought forward by the district surveyor and those instructing him, and under the circumstances I do not propose to allow any costs.—A second summons was adjourned for a week.

MR. JOHN CASSIDY, of Manchester, has just completed his statue of the late Ben Brierley, and it has been placed in front of the Museum in Queen's Park. The statue is in Portland stone, and is considerably larger than life-size. It represents the subject standing in what seems to have been a favourite attitude, the left arm raised and the right arm hanging by his side. In the left hand he holds some leaves of a manuscript, and his right hand rests on the papers which he has just put down on a block of stone. The right knee is bent slightly forward, and the head is erect. The figure is well posed, and has both dignity and character; there is an animated expression on the face, and the ugly modern clothes, especially the frock coat, with its stiff perpendicular lines, are treated unconventionally, so that with their creases and wrinkles they really help to make up a simple and natural portrait of the man as he lived. In making such a statue interesting from an artistic point of view, Mr. Cassidy has achieved no small success.

ST. ANDREW'S Roman Catholic Cathedral, Glasgow, which has so narrowly escaped destruction by the recent fire in that city, is over eighty years old. The building was begun in June, 1814, and was completed in 1816. At that time it was reckoned a very ornamental addition to the Architecture of the city. Whatever may still be said of the style of the structure, it is certain that if it had fallen a victim to the flames a more costly and more ornate church would have been erected in its stead. When the bishopric was restored, St. Andrew's naturally became the cathedral church of the diocese, over which the venerable Archbishop Eyre, formerly of Newcastle, now presides. It has only been during the present century that the Roman Catholics in Glasgow, since the Reformation, ventured to erect a place of worship of the architectural pretensions of St. Andrew's Cathedral.

At the International Art Exhibition at Vienna, British Art is represented by several pictures and drawings by artists of note among us. The chief works shown are Mr. E. A. Abbey's "Hamlet," Mr. Solomon J. Solomon's "Venus," Mr. Arthur Hacker's "The Cloister or the World," Mr. J. R. Reid's "Market in a Seaport," and "Foxhounds passing through a village," Mr. H. W. B. Davis's "Sheep in a Field," and other pictures by Mr. William Stott, of Oldham, Mr. Alfred Parsons, and Mr. Walter Crane. The whole collection of British work is well placed in a central position in the Exhibition.

A REMARKABLE feat is being performed at the Atlas Spinning Mills, Darwen. Some years ago the outside walls of the mill, which appeared to be constructed upon a foundation of sand, gave way, and the room floor and the machinery, &c., had a very irregular, switch-back form, work being considerably interfered with in consequence—in fact, some of the machinery was partly broken. When Mr. G. P. Holden, the new owner of the mill, realised the importance of this defect being remedied, he arranged with Mr. R. Shorrocks, contractor, to have the building placed upon a good foundation and the rooms levelled. A staff of men were set to work, and the process of dropping the building as it stood was commenced. In places as much as 11 in. have been cut from some of the bottom pillars, and the pillars above have been held up, along with the roof, by means of powerful jacks and packing. The whole of the rooms and the machinery have been lowered this distance without damage being done, and it is expected that the work of levelling the whole building in this manner will soon be completed.

SOME interesting discoveries have been made during the progress of excavations for the New Boveney Lock on the Thames, near Windsor. At the depth of 14 ft. the workmen came upon the bones and skull of an animal said to be a primeval ox, whose body had sunk with the movement of the quicksand, which is supposed to have undermined the bogland covering the area at that remote period. A skull and a flint battle-axe were also brought to light, the antiquities having lain buried, it is conjectured, since the Stone Age.

THE post of Keeper of the Royal Academy, made vacant by the death of Mr. P. H. Calderon, R.A., is regarded at Burlington House as second in importance only to that of the President. The Keeper is responsible not merely for the galleries of the Royal Academy and the pictures, ancient or modern, which they may happen to contain, but for the schools also, and the discipline and conduct of the students. Although the Keepership entails so many responsibilities, the post is a desirable one. The salary is £750 a year, besides a good house and studio. The Keeper's House stands in the corner of the Academy quadrangle, not far from the entrance to the Diploma Gallery. The vacant post must necessarily be filled very soon, and the name of Mr. Yeames, R.A., the Academy Librarian, has already been mentioned as that of a possible successor to Mr. Calderon.

Surveying & Sanitary SUPPLEMENT.

MAY 11TH, 1898.

THE CAMERA AS A SURVEYING INSTRUMENT.

By G. A. T. MIDDLETON.

THE idea of employing photography to aid land surveying work is an old one, but while a good deal of attention has been given to it, only recently have any practical results been achieved, and it can scarcely be said that perfection has yet been reached. At something has been done, and it is well at this something should be made more widely known to surveyors. Firstly, it is necessary that the surveyor should be a good technical photographer, understanding the mysteries of plate changing,

or three prints from each, sending at least one set home at the first opportunity, so that in case of the negatives being broken or lost, the record may be still complete.

A special camera invented a few years ago by Colonel Stewart, however, did more than this. It could be erected over the theodolite stations, and was so contrived that it rotated by clockwork, and when set in motion a long negative was obtained upon a broad strip of celluloid, giving a complete panoramic view. When printed, the strip would form a complete circle on its ends being connected, and it could then be used for map-making with considerable precision, similar films being taken at each theodolite station; though, of course, there would be slight errors owing to the film rollers varying in diameter as they un-

parts of the world it is much less noticeable than it would be in England, and could be put right by local intensification or reduction of the negative after development.

Quite recently an instrument called the Photo-Theodolite has been introduced, which in appearance is like a square box camera, resting on the horizontal limb of a Theodolite, and carrying the vertical limb. The compass is within the camera box, and cross hairs are stretched across a frame, which also supports celluloid graduated arcs with angular readings on them, varying accordingly to the lens used. When the dry plate is in position and the slide open, the carrier, together with its cross hairs and graduated arcs, is racked against the plate. The direction in which the camera points is determined by the Theodolite telescope, and

SIDE VIEW OF PHOTO-THEODOLITE.

BACK VIEW OF PHOTO-THEODOLITE.

posure, development and printing, so as to produce a clear sharp negative and an equally sharp print. Further than this, he must purchase the necessary expensive apparatus, and he must be engaged upon work which it would be a waste of time to do if he did not intend to spend a great deal of money in delineating. For ordinary plan surveying he must depend upon his usual instruments, but it is often useful to be able to take home a record of the topography of the country surveyed, that those who are not themselves technically capable of reading a map may understand the country through which a proposed railway or canal is to be constructed, and this in great detail.

Of course, any ordinary camera can be employed, and a series of negatives taken, ordered to numbers in an index, the only special precaution required being to develop the negatives at the surveying camp as soon as possible after being taken, and to make two

rolled and rolled up. If, however, the measurements be made from the negative, the results have been tested and found to be absolutely accurate, lifting the camera from the position of a toy to that of an almost perfect surveying instrument.

On such surveys as that of the North-West boundary of India, this instrument is of great value; but it has the disadvantage that, the speed of rotation once selected, it would make a complete revolution at the same speed, so that in many situations a piece of open, well lit country, say, to the south, might give an over-exposed portion of film, while a ravine or deep valley in the north would be just as greatly under-exposed.

This, however, can be compensated by taking two negatives, at different speeds of rotation (giving different exposures), to meet the two extremes; and in the clear atmosphere of many

on exposure the representation of the hair on the plate is exactly that of the hair on the telescope when level. The instrument is used over Theodolite stations, and Theodolite readings are taken in the usual way, the negatives being taken along lines which are thus recorded. It is usually the practice, when using such an instrument, to take two negatives of each view, giving them different exposures to provide against error.

It is somewhat of a disadvantage that the compass should be so awkwardly placed within the camera for general Theodolite use, particularly as all its parts have to be painted black, and it must also be awkward at times, especially when traversing, to have only one vernier on the horizontal limb. These are only minor objections, and both the instruments which we have mentioned are serious attempts to add the camera to the surveyor's equipment.

Power from Compressed Air.

SOME GENERAL MISCONCEPTIONS.

COMPRESSED AIR has been abused in its use most shamefully, and until recently none of its friends have been able to be seen or heard, so intensely has the interest of the world been centred upon the marvellous results of the investigation into electrical phenomena. The mysterious has such a fascination for the ordinary mind, and the meteoric developments of electrical science have come so thick and fast, and in so many fields of usefulness, that the average individual could be stampeded into the electrical camp by a mere mention of the name of this most elusive fluid. Now there has come a breathing spell, and the advocates of compressed air are calling attention to the fact that compressed air, properly generated and applied, owns a place in the economics of the day, and this they propose to maintain. Compressed air has been generally understood to be

A MOST EXPENSIVE FORM OF POWER,

and has been given sufferance only because of its utility, since for underground work it really has no rival at any price. Because the laws of compression and expansion of permanent gases belong to the realm of higher mathematics, few understood what they were dealing with, and many of these, unable to overcome the freezing of their motors, did as the public generally did—namely, used the air at practically full stroke, and threw away all the intrinsic energy of the air which we can develop by expansion. Theoretically they thus threw away two-thirds of their power, and practically about three-fourths. Ordinary direct-acting pumps and rock drills do not have an efficiency of even twenty-five per cent. No small wonder, then, that the wood piles have dwindled rapidly away and small power results have been produced. Everything was sacrificed to utility (says Mr. Edward A. Rix, in *Cassier's Magazine* for May), and compressed air did not take its proper rank until engineers began to realize that it must be

USED EXPANSIVELY.

To use air in an ordinary direct-acting pump is equivalent to throttling a head of water to one-fourth of its spouting velocity to accommodate the speed of a wrongly-gearred water-wheel. I fancy that most of the trouble on the whole subject has arisen from a misconception of what compressed air is in a power sense. Many believe that the power of the engine which compresses the air has been stored in the air compressed, and the more steam they give the engine and the harder it worries and flurries, the more work the air should finally yield up. They do not understand that a pound of compressed air at the same temperature contains the same intrinsic energy, no matter what the pressure is, and this is originally contained in the atmosphere before it is compressed at all. This being the case, no matter what power was expended to compress 1lb. of air to, say 90lb. gauge pressure, it will have at the same temperature but one intrinsic potential stored within it. Temperature is the head—if I may use a term applied to water—from it comes the power.

THE total length of the new Victoria Bridge across the River Ayr, is 220ft., the width between parapets being 40ft. The bridge is formed of three spans, the piers and the abutments being bedded in the solid rock. The cost of the bridge, with its approaches and the other work done by the town at this place, will amount to about £8000. Mr. William Clarke, builder, Ayr, is the contractor for the whole contract, his sub-contractors being Messrs. Alexander Findlay and Co., Motherwell, for the steel and iron work, and Messrs. Walker and Son, Ayr Chemical Works, for the bitumen and tar macadam work. The burgh engineer, Mr. John Eaglesham, C.E., prepared the plans, and Mr. W. Murray has acted as clerk of the works.

HEATING AND VENTILATING HOUSES.

THE subject of heating and ventilating houses is dealt with in an interesting article in the *British Medical Journal*: "The habits of different nations," it says, "in the matter of warming of their houses would afford a curious subject of investigation for some sociologist of leisure. Civilised people who inhabit countries which have a really cold winter—the Canadians, for example—arrange to warm their houses throughout by hot air or hot water, and keep rooms and staircases and corridors more or less at an even temperature, which can be regulated to within a few degrees, whatever the cold outside. In many countries with a hot summer—in Italy, for instance—

THE MEANS OF WARMING ROOMS

in cold weather are very inadequate, almost non-existent, and the inhabitants and their travelling guests shiver round a brazier, or boldly sit out the cold wrapped up in their warmest garments, which seem designed rather for use indoors than out. The Russian builds himself a flat brick stove in the middle of his room, and most of his time indoors he spends on the top of it. In Great Britain we have no system in particular, but after the manner of the noble savage when wild in woods he ran, we build a great fire round which we sit roasting our shins while the back freezes. The despairing suggestion is now made that we should keep 'the air inside the house nearly the same as the air outside, and dress accordingly.' If this means that we should take pains to keep our rooms well ventilated and free from what Dr. Ransome has picturesquely called

'AIR SEWAGE,'

no better advice could be given. But to attain this end there is no need to let the temperature of the house sink to the level of the exterior, nor, indeed, to do away with the open fireplace, the 'sea-coal fire' which Lord Byron loved, 'when not too dear.' The mischief of the fireless room, and of the stove-heated room, is that when the external air is very cold there is a natural tendency to close all doors and windows, so that the rooms become both stuffy and hot. The salvation of British rooms is the open fireplace. It is a very ineffectual warmer of the room, and, as usually constructed, does little or nothing to warm the air. When burning brightly it acts as a powerful extractor of air. As we do not, as a rule, provide inlets for the air at suitable places, it is drawn from doors and windows and floors, for bricks are pervious, whence draughts and cold feet. This is very stupid, for it is easy to get an open grate which will admit into the room a sufficient quantity of warmed air. Such grates are to be seen in many hospitals; why they have not yet found their way into most houses is a mystery which architects and builders may be asked to explain."

AN exhibition of plumbers' work, the result of a prize competition organised by the Council for Manchester and District of the National Registration of Plumbers, has been held in one of the rooms of the City Art Gallery. At the opening, Mr. J. W. Hurst, secretary, explained that the Council regretted that they had been able to offer only £75 in prizes, but it was believed that the quality of the work had not suffered on that account, and as a matter of fact there had been 241 entries in seven classes. The exhibition preceded the handing over the prize work to the Technical Instruction Committee, as a nucleus for a permanent sanitary museum. It was pointed out that the objects of the registration movement "are to secure a more scientific training for plumbers, and the enforcement of disciplinary powers, with a view to the protection of the public against the dangers arising from inferior workmanship." The specimens shown in the exhibition afford proof of the advance recently made in this department of sanitary provision.

Surveying and Sanitary Notes.

A DISTRESSING account is published of the insanitary condition of Perth, Western Australia. The town has a population of about 50,000, and not even the most elementary system of drainage. An Englishman, who went there in February last, recently wrote, saying:—"All the dirty water and refuse is run by each house into a hole in the sand, then rain comes and a hot sun, and then typhoid and diphtheria."

THERE is a difficulty at Derby about sewers. An action has been brought against the Town Council with respect to the disposal of the sewage of the town, and the matter was to have been submitted to the decision of the Derbyshire County Court Judge on May 5th. An arrangement has, however, been made, so that the threatened action is, at any rate, to stand over for the present. This will give the Council further time in which to complete a main drainage scheme.

It looks as if the bacteriological treatment of sewage is likely to prove a great success, and to solve one of the most difficult problems with which modern communities have to deal. The experiment tried by the Leeds Corporation with two tanks under Mr. Dibdin's supervision has proved satisfactory, and the Committee have now decided to construct four new tanks. That the purification by the bacteriological process is effective is shown by the fact that for four months three small carp have lived in the purified effluent with health and comfort. Meanwhile, Manchester is deciding to lay down bacteria beds.

AN important arbitration case has been decided by Sir Benjamin Baker, appointed by the High Court of Justice, and sitting at the Westminster Palace Hotel. It arose out of a claim by the Manchester City Council for £12,000 damages against Messrs. Perkins, Graham, and Co., contractors, for certain sewers in Deansgate, Manchester. On behalf of the Corporation it was stated that the work was so badly and imperfectly done that they had to practically reconstruct the whole of the sewers. On behalf of the contractors the scamping was acknowledged, but it was laid to the door of the working bricklayers, who were charged with cheating contractors and Corporation alike. Mr. Perkins and his agent, Mr. Tomlinson, had occasionally inspected the work, and all had appeared to them to be right. When the defects were discovered the contractors offered to make good the deficiency, and to hand over the sewers finished properly in accordance with the contract terms. This the Corporation refused to allow them to do. They were willing to pay what was fair, and they had deposited £1900 in court.

SIR BENJAMIN BAKER, the arbitrator found that the defendant company committed breaches of the contract set out in the statement of claim, and that such breaches consisted in part in the fraudulent substitution by workmen employed by the defendant company of works not in accordance with the terms of the said contract for the works which the defendant company were bound to execute, and which the said workmen were employed to execute. "It was the duty of the defendant company and the defendant James Perkins to have prevented the said fraud, and to have discovered and remedied the improper substitution of works, and that by the negligence of the defendant James Perkins, or those for whom he and the defendant company were responsible, the defendant failed to prevent or discover the same," but his failure to do this was due to negligence, and that owing to such negligence the defendant "was not aware of the said fraudulent acts, and that he was not party or privy to any fraud in the matter and that neither he nor any other director or agent of the company having any duty on

authority to make any representations to the plaintiffs on the subject made any fraudulent representations." In respect of the contract in the statement of claim, the Arbitrator finds that the plaintiffs were entitled to retain the sum of £464 16s. 2d., and to receive out of the sum of £1900 paid into court by the defendants, and to receive from the defendant company a further sum of £1849. In respect of contract No. 11 in the counter-claim the plaintiffs were entitled to retain the sum of £350 in satisfaction of the breaches of that contract. The Arbitrator further finds that the defendants Godfrey Heathcote and Richard Jessop Dearden are liable upon their bond as sureties for the defendant company to pay to the plaintiffs a sum or sums not exceeding £1000 in discharge or part discharge of such part or any of the said sum of £1849 as the defendant company shall fail to pay in pursuance of the award and judgment entered thereon. Accordingly he directs that the sum of £1900 paid into court in the action, and any interest that may have accrued hereon, be paid to the plaintiffs, and that judgment be entered for the plaintiffs against the defendant company for £1849, and against the defendants Godfrey Heathcote and Richard Jessop Dearden jointly and severally for £1000, but the judgment be not enforced against the last-named defendants except for such part of the sum of £1849 as the defendant company shall have failed to pay. He orders that each of the parties shall bear his and their own costs of the action and counter-claim and all proceedings thereon, including the trial, and that the costs of the award, which are fixed at £296 15s. 6d., shall be paid, as to one moiety to the plaintiffs, and as to the other moiety by the defendant company. In conclusion the Arbitrator declares that, save as aforesaid, no party to the action or counter-claim is entitled to any relief against the others or other in respect of the matters referred to him.

In the Chancery Division of the High Court of Justice, judgment has been delivered in the case of Fielden v. The Mayor and Corporation of Morley, by Mr. Justice Byrne. His Lordship held the plaintiff sued the Corporation, claiming an injunction to restrain them from constructing a certain catchwater, or in any way causing or allowing water to collect and flow on to the plaintiff's land, and also to restrain the defendants from trespassing on any part of the plaintiff's land. The plaintiff so nominally asked for damages, but only by way of raising the question of his right. It had been argued that the Corporation were not entitled to make a certain weir, or bye-wash, because by so doing they had failed to make the catchwater for conveying the water from

the estate watertight. The real question was whether the defendants were entitled to construct this bye-wash. He did not think it offended against the provisions of the Act that the catchwater had to be made watertight, and he had a strong body of evidence to show that the bye-wash was properly constructed, and in the proper place. He therefore came to the conclusion that the bye-wash was a proper work, and did not infringe upon the provision that the catchwater was to be constructed and maintained watertight. Assuming the injury to have been caused by the leaking, overflow, or failure of the works, the statute provided for the remedy under Section 140 of the Railway Clauses Act, 1845, which pointed out the method of determining the amount and of enforcing payment. As to the blocking-up of the catchwater by stones and sand, it was only done for a temporary purpose, and as to the technical trespass committed in this regard, his Lordship said that no injury had been done to make it actionable. The plaintiff's action, therefore, failed, and judgment would be for the defendants, with costs as between solicitor and client.

THE Birmingham Public Works Committee report that plans have been submitted for the laying out of the estates lying between Balsall Heath Road and Edgbaston Road, and it is found that the sewers in the district are too shallow to effectually drain the area. It is also found that, owing to the development of property in this part of Balsall Heath, the sewers which were constructed by the late Local Board are already overcharged, and that the sewers in Court Road and Clevedon Road are in an unsatisfactory condition. Under these circumstances, it has been necessary to devise a scheme of main drainage for the low-lying portion of Balsall Heath, between Balsall Heath Road and Edgbaston Road. The city surveyor has prepared a scheme by means of which the whole of this area can be effectually and satisfactorily drained, utilising the sewer in Alexandra Road, which is of adequate dimensions for the purpose. The new sewer will be an oval brick one, 3ft. 4in. by 2ft. 6in. as far as the junction of Cannon Hill Road and Edwardes Street, and from that point to its termination in Edgbaston Road a 2ft. 3in. stoneware pipe, the estimated cost amounting to £5500, presuming that the ground is of fair average quality.

SHOULD everything go well, the reconstruction of Jamaica Bridge, Glasgow, will be completed early next year. The first two arches have been built with Cornwall granite, and so will the seventh, while the other four will be chiefly constructed with Fife and Aberdeen blocks. There have been 54 cylinders sunk, most of them to a depth of

75ft., although others as deep as 106ft., the latter being the greatest depth. A capital bed of freestone rock was got. It was found that an air pressure of about 45lb. was required at a depth of 106ft., and this was too much for the men to work at. The engineers and all concerned were satisfied that having secured a splendid hard and pure gravel bed at a depth of 75ft. this was quite sufficient, and work could be fairly comfortably conducted with something like 34lb. of air pressure. Upon what has become known in the works as the test cylinder, one of those reaching a depth of 75ft., there was placed 1100 tons of rails, and in the course of three months the yield was only one-eighth of an inch. It was the intention originally to replace the balustrade of the old bridge in its simple dressed condition; but the Corporation seem to have acted judiciously in ordering that every block of granite be polished. Messrs. Morrison and Mason are the contractors.

MR. HERBERT VIVIAN, in his recent book on "Servia," states that the sanitary service is very well organised. There are medical officers for departments and districts, and they have power to impose the minutest sanitary regulations, and even to prescribe the food of the people, which they do not hesitate to do whenever occasion requires.

In the Queen's Bench Division recently the case of the Cuckfield Rural District Council v. Goring was heard. It was an appeal by the defendant from the decision of the County Court Judge of Sussex sitting at Worthing. The action was brought under section 25 (2) of the Local Government Act, 1894, which provides that "where a highway repairable *ratione tenuræ* appears on the report of a competent surveyor not to be in proper repair, and the person liable to repair the same fails, when requested so to do by the district council, to place it in proper repair, the district council may place the highway in proper repair, and recover from the person liable to repair the highway the necessary expenses of so doing," to recover the cost of repairs executed by the plaintiff council to two foot bridges, which it was alleged the defendant was liable to repair *ratione tenuræ*, as owner of two farms. The County Court Judge held that a liability to repair the foot bridges attached to the farms in question, and he further held that under section 25 (2) of the Local Government Act, 1894, proceedings might be taken against the owner of lands to which such an obligation attached, and he gave judgment for the plaintiffs. The defendant appealed. The appeal was allowed.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF TENDER.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
14	Sherburn-in-Elmet—Additions, &c., to One Cottage ...	Governors ...	Wm. Bakewell, Architect, 38, Park-square, Leeds.
14	Downpatrick—Alterations and Additions to Infirmary ...	School Board ...	County Surveyor, Downpatrick.
14	Paisley—Public School ...	Leeds Co-operative Society ...	John Hutchison, 112, Hope-street, Glasgow.
14	Pudsey, Yorks.—Twelve Terrace Houses ...	School Board ...	Herbert Hodgson, Architect, Old Bank-chambers, Bradford.
14	Athlone—Schools and House	P. J. Prendergast, Northgate-street, Athlone.
14	Willenhall, Staffs.—Infant School and Alterations	J. P. Baker, Architect, 33, Market-place, Willenhall.
15	Tullamore, King's County—Church	W. Hague, Architect, 50, Dawson-street, Dublin.
16	Accrington—Infant School	Henry Ross, 15, Carron-street, Accrington.
16	Fowery, Cornwall—Erection of Buildings ...	Fowery Wine Company ...	Sampson Hill, Architect, Redruth.
16	Garlands, near Carlisle—House for Patients ...	Lunacy Committee ...	G. D. Oliver, Architect, 5, Lowther-street, Carlisle.
16	Garlands, nr. Carlisle—Additional w.c. Accommodation ...	Lunacy Committee ...	G. D. Oliver, Architect, 5, Lowther-street, Carlisle.
16	London, E.C.—Foundations ...	Commissioners of H.M. Works ...	H. Turner, 15, Whitehall-place, S.W.
16	Western Point, near Runcorn—Reconstruction of Church Spire ...	Weaver Navigation Trustees ...	J. A. Saner, Engineer, Norwich.
16	Aintree, near Liverpool—Erection of Shops	W. P. Hartley, Aintree, Liverpool.
16	Mount Pleasant, E.C.—Foundations at Parcel Depot ...	H.M. Office of Works ...	H. Turner, 15, Whitehall-place, S.W.
16	Southampton—Erection of Lodging-house ...	Corporation ...	Borough Engineer, Municipal Offices, Southampton.
16	Wednesbury—Erection of Fire Station, &c. ...	Corporation ...	E. Martin Scott, Borough Surveyor, Town Hall, Wednesbury.
17	Ipswich—Erection of Classroom ...	School Board ...	T. W. Cotman, Architect, Northgate-street, Ipswich.
17	Croydon—Store and Workshop ...	Corporation ...	A. Broad, Architect, 22, George-street, Croydon.
17	London, E.C.—Underground Conveniences ...	Corporation ...	Corporation Engineer, Guildhall.
18	Patricroft, Larcs.—Erection of Infirmary ...	Guardians ...	Hurrell and Taylor, 25, Brazennose-street, Manchester.
18	Burslem, Staffs.—Erection of Facing, &c. ...	Agricultural Society ...	Secretary, Newcastle, Staffordshire.
19	Lancaster—Wing for Royal Albert Asylum	Austin and Paley, Architects, Castle Hill, Lancaster.
19	Marsden, near Huddersfield—Five Shops and Houses	J. Kirk and Sons, Architects, Huddersfield.
20	Banstead—Drill Hall and Gymnasium ...	Kensington and Chelsea School District ...	C. Sharp, 59, Finchchurch-street, E.C.
21	Annan, Scotland—Erection of Slaughter House ...	Burgh Commission ...	A. Tweedie, Surveyor, Lady-street, Annan.
21	Draperstown, Londonderry—Erection of Church ...	Rev. P. Grant ...	E. J. Toye, Architect, Strand, Derry.

COMPETITIONS.

DATE DESIGNS TO BE SENT IN.	DESIGNS REQUIRED.	AMOUNT OF PREMIUM.	BY WHOM ADVERTISED
May 18	Wrexham, Denbighshire—County Intermediate Schools	£50, £20	W. R. Evans, 56A, Hope-street, Wrexham.
June 1	Wallsend—Laying-out Park	£50, £20	Wallsend Urban District Council.
" 7	Salford—Designs for Chapels, &c., at Cemetery	£50, £20, £20	Corporation.
" 24	East Ham—Offices, Fire Station, and Public Baths	£105, £52 10s.	Urban District Council.
July 1	San Francisco Bay—Designs for University Buildings	£10,000 (divided in two competitions)	Trustees of the Phoebe A. Hearst Fund; represented England by the R.I.B.A.
1	Formby—Schemes for Sewerage	£100, £50, £25	Formby Parochial Committee.
2	Warrington—Designs for Police Station, Court House, &c.	£100, £50, £25	Town Council.

A SHIP FRIEZE. DESIGNED BY F. HAMILTON JACKSON. MANUFACTURED BY WYLIE AND LOCHHEAD.

Two Wall-Paper Friezes.

WE illustrate on this page two wall-paper designs for friezes, by Mr. F. Hamilton Jackson and Mr. Arthur Gwatkin respectively, manufactured by Messrs. Wylie and Lochhead, 35, Maddox Street, W. The original drawing of the chrysanthemum frieze was exhibited in the architectural room of the R.A. and the Arts and Crafts in 1896. The outline only of the design is in relief, the colour decoration, entirely brush work, gradating and slightly colour relieved. While the colour is wet, the whole frieze is rubbed off, leaving the outline in places more or less free of colour. The colour scheme is executed either on the material or on the material covered with aquerred metal. The latter course gives richness, and the outline after the rubbing off appears as gold or bronze, whichever lacquer has been used. The same process is carried out with the "ship" frieze. This design looks exceedingly well in plain white; however, the lines of the drawing are sufficient with the decorativeness of the light and shade of the relieved outline. Messrs. Wylie and Lochhead have also tried bronze and copper lacquer treatment of this design without other colour, with splendid result. Wylie and Lochhead, we think, have greatly advanced their collection of designs and the method of printing, and careful consideration of colour should make their set useful and trustworthy. Besides these relief friezes, the firm has a number of designs with a printed outline, and colour decoration with brushwork. The value of the outline relief is lost, but the friezes are much less expensive, and the decorativeness of the handwork and the possibility of making a scheme for its particular site is retained.

At the Southwark Police Court James Car-chael, builder, of Wandsworth, has been summoned for beginning the foundations of a building without having given seven days' notice to the Bermondsey Vestry. The magistrate fined the defendant £5, with further penalties of 10s. a day for fifty-six days, and costs of the summons, making £33 2s. all.

R.I.B.A.

THE ANNUAL GENERAL MEETING.

THERE were not many matters of interest to be decided at the sixty-fourth annual general meeting of the Royal Institute of British Architects, held on Monday week, under the chairmanship of the vice-president, Mr. H. L. Florence. The Hon. Secretary announced the decease of the following members: Augustus Laver, Hon. Corr. Member (San Francisco), elected in 1879; and Walter Seckham Witherington, Fellow, elected in 1881. The meeting approved of a recommendation of the Council to admit the Aberdeen Society of Architects to alliance with the Institute. The report of the Council for the official year 1897-98 having been submitted and taken as read, its adoption was formally moved by the Chairman, and seconded by Mr. B. Ingelow. The Secretary then read the

REPORT OF THE AUDITORS,

Messrs. Edmund Woodthorpe and Owen Fleming, which stated:—"We have examined the vouchers, books, and accounts generally of the Institute for the year ending December 31st, 1897, and it is with great pleasure that we are able to report our entire satisfaction. The books have been carefully and accurately kept, and an efficient control over the expenditure has been maintained. We have examined and verified the several securities, and note that the Certificate of the £40 Madras Railway 4½ per Cent. Stock, purchased on December 3rd, 1897, has not yet been delivered by the bankers. The year's working shows a net profit of £1116 1s. 11d., this being £516 1s. 11d. in excess of the estimated profit. The total cash balance of ordinary funds in the hands of the bankers on December 31st, 1897, was £1568 17s. 8d. In addition to this, the invested funds have been increased by donations and transfers from income to £4970 0s. 6d. The Institute therefore occupies a better financial position than it has done for some years past."—A general discussion on the annual report ensued, in the course of which Mr. Max Clarke, Hon. Secretary of the Science Standing Committee, asked for an explanation

of the omission from the printed report of that Committee of a clause relating to the publication in book form of the results of the

BRICKWORK TESTS,

as contained in the report originally sent in to the Council; and moved that such clause either be inserted in the printed report, or the words "Revised by the Council" be added after the heading thereof.—The Chairman having pointed out that some misapprehension existed, it was ultimately agreed that a footnote should be added to the report stating that the Council would consider the advisability of publishing the results of the brickwork experiments in the form proposed by the Committee.—The report was then approved and adopted.—The lists of attendances of members at the several meetings of the Council and Standing Committees during the official year having been submitted and taken as read, the following members were appointed scrutineers to direct the election of the Council and Standing Committees for the ensuing year of office, and report the result thereof to the business general meeting of June 6th, namely, Fellows: H. P. Burke Downing, John Hebb, F. Hooper, Delissa Joseph, Zeph. King, Hugh Stannus, and others to be appointed by the Council; Associates: W. A. Forsyth, H. Hardwicke Langston, F. W. Marks, H. A. Satchell, E. Wimperis, and H. A. Woodington.—On the motion of the Hon. Secretary, a vote of thanks was passed to Messrs. Edmund Woodthorpe and Owen Fleming for their services as auditors of the past year's accounts; and Messrs. Zeph. King and F. W. Marks were nominated auditors for the ensuing year.—The Statutory Board of Examiners were re-appointed as follows:—Messrs. Lewis Angell, Francis Chambers, Professor Banister Fletcher, Ebenezer Gregg, F. W. H. Hunt, E. B. P'Anson, Professor Kerr, J. Douglass Mathews, Lacy W. Ridge, Professor T. Roger Smith, Benj. Tabberer, and T. H. Watson.

The Baptist and Congregational Union have decided to build a new chapel at Beeston. Mr. C. Nelson Holloway, of Nottingham, has been appointed architect for the building, which is to be proceeded with at once.

THE CHRYSANTHEMUM FRIEZE. DESIGNED BY ARTHUR GWATKIN. MANUFACTURED BY WYLIE AND LOCHHEAD.

ART OF THE YEAR.

THE ROYAL ACADEMY BANQUET.

THE annual banquet of the Royal Academy took place on Saturday week, under the presidency of Sir Edward Poynter, the President. There was a distinguished company present. The Prince of Wales, in responding to the toast of his health, said in the course of his speech:—Allow me to thank you for having made reference to the Committee about to be formed to erect a suitable memorial to your illustrious predecessor, Sir John Millais. I sincerely hope that such a memorial may be in all respects as suitable as the one which was instituted for his lamented predecessor, Lord Leighton. It is not for me on this occasion to allude to the merits of that distinguished artist, Sir John Millais; but a few weeks ago, in these very halls, we had ample opportunity of seeing and admiring his works. It was marvellous that during the course of his life he was able to produce such beautiful works of Art, works which I am sure will go down to posterity. I am grateful to you, sir, for the allusion to the Paris Exhibition. I sincerely hope, as I am sure, that under the auspices of the Committee to be formed British Art may be well represented. I regret to think that there is not space for works of Art illustrative of former periods, but I am in hope that there will be a small exhibition of Old Masters, which can be shown, if those who possess them will kindly lend them, in a pavilion erected illustrative of

OLD ENGLISH ARCHITECTURE.

You alluded to matters connected with Art which have taken place during the last year. In connection with that subject I cannot help thinking that not only the artistic world but the whole nation may be congratulated on having had left to it perhaps the finest bequest ever made during the century—that of the Wallace collection at Hertford House. Every one who sees it will admit that such a collection is not only unique, but magnificent, and it was a kind thought on the part of Lady Wallace to bequeath so fine a collection to us. It has been envied by many nations. I had also the pleasure at the close of last summer to inaugurate the Tate Gallery. This was due to the munificence of Mr. Tate, who not only erected a very handsome building, but himself gave sixty pictures. In this building there are found also not only a certain overflow from the National Gallery, but also the pictures of the Chantrey Bequest, which are so much admired. As regards this Exhibition it is not for me to say anything, but, from the cursory examination I have been able to make of the galleries, I have little doubt that this Exhibition is the equal of those that have preceded it. I congratulate the artists who have pictures on the walls, and it is my fervent wish that Art may long flourish in this country, and that we may hold our own with other countries in this respect.—After the toast of "The Army and Navy" had been received, the President proposed "Her Majesty's Ministers," and, in replying, the Duke of Devonshire offered his congratulations on the success of the Exhibition, which more than sustained the standard of its predecessors. For the high standard which British Art had now reached no Government could claim any credit. But at the same time he did not think the State was open to the reproach which had sometimes been levelled against it, of utter indifference to

THE INTERESTS OF ART.

Through the Science and Art Department the State had established a School of Art and of artistic instruction, a school wide in its operation, although strictly limited in its scope and aim. The prosperous state of our finances, and the liberal spirit in which the Chancellor of the Exchequer had dealt with the question, had provided a very large sum to be applied to the completion of the necessary accommodation of the public offices and, he was happy to say, for the completion of the South Kensington Museum. The sites which were at their disposal offered great opportunities, and he was happy to be able to state

that they had been fortunate enough to secure the assistance and the advice of Professor Aitchison, President of the British Institute of Architects, and a member of the Academy, in regard to the great building scheme which was now under the consideration of the Government, and he hoped that they might succeed, as it was their intention to succeed, in erecting a series of buildings which should not be

UNWORTHY OF THE SITES

upon which they were to be erected, or of the purposes to which they were to be devoted. As to the gracious action of her Majesty the Queen herself in opening the palaces of Kensington and Kew to the public, the President of the Royal Academy was largely responsible for calling public attention to the condition of that beautiful building—the work of Sir Christopher Wren—at Kensington, known as the Banquet House. That building was lately in a deplorable condition, the result of past neglect. That neglect was now being rectified, and a really beautiful work of Art would soon be restored to the possession of the public. The same might be said of Kensington Palace, which, owing to the neglect of past generations, was falling into a state of decay. Fortunately, it was not too late to remedy that neglect, and in a very short time he trusted that London, and especially Kensington, would benefit by the placing at the public disposal of a most interesting historical relic, and also, possibly, a still more interesting historical museum, if the intentions of Her Majesty's Government were fully carried out, and certain works of Art, illustrative of the reigns of the sovereigns who occupied the Palace, were placed there as soon as it should be in a condition to receive them. While the Government believed that British artists neither required nor desired State inspiration, State guidance, or State regulation, they felt at the same time that it was the duty of the Government to do everything within their proper sphere to promote the interests of Art, and to make it possible that our people should be known throughout the world, not only as a practical, but a cultivated people.

The foundation-stone has been laid of St. Aidan's Church at Bradford, Manchester.

The prize drawings of the Royal Institute of British Architects were last week on exhibition at Liverpool.

MR. FRANK WALTON, R.I., has been elected president, and Mr. S. Melton Fisher vice-president, of the Institute of Painters in Oil Colours.

A new school building has been erected at Sellack, Ross. The building is built in red bricks, covered with Broseley tiles, and is 40ft. long by 18ft. wide.

JAMES CUTHBERTSON, jun., carting contractor, Raise Street, Saltcoats (Scotland), has been fined £2 for deviating from plans passed by the Commissioners, by constructing the inside partition walls of lath and plaster instead of brick in two dwelling houses.

The London County Council has agreed to a recommendation of the Building Act Committee to the erection of the Sir John Cass Technical Institute on the east side of Jewry Street, to abut also upon George Street and Little George Street. The plans are by Mr. H. W. Cooksey.

Church extensions and improvements are engaging attention at Devonport. At St. Stephen's a new aisle has been built. St. Aubyn Church is undergoing interior restoration. The prospective undertakings are the erection of a new parish church, and the provision of church accommodation in the neighbourhood of the Royal Naval Barracks.

The Birmingham Museum and School of Art Committee, in their annual report, recommend that they be authorised to purchase 1780 square yards of freehold land, at the corner of Moseley Road and Lime Grove, with the three dwelling-houses thereon, at a cost of £2250, and to erect thereon a branch School of Art, at a further cost not exceeding £7750, inclusive of buildings, fittings, examples, architect's commission, and any other charges.

KEYSTONES.

A new Conservative club has been opened at Plasmarl, Swansea.

A new chapel has been built at Senghenydd. The architect was Mr. Bruton, Caerphilly, and the builder Mr. Joseph Howells, Caerphilly.

The north aisle has been added to St. Alban's Church, Sneinton, in accordance with the designs of the complete scheme.

The Croydon County Council has resolved to erect new fire brigade stations at Croydon, Thornton Heath, and South Norwood, at a cost of nearly £5000.

The Strand Board of Works has decided to ask the London County Council to include in their next General Powers Bill a clause prohibiting advertising by means of "search" or "flash" lights thrown upon the public highways.

There has been placed in St. Magnus Cathedral, Kirkwall, a memorial stained-glass window. The subject depicted is Christ's story of the good Samaritan. The work was executed by Messrs. Ballantyne and Gardner, Edinburgh.

A scheme is on foot for the construction of a road tramway from London to Oxford. The service will, of course, be completed sectionally, but when the scheme is fully worked out it will be possible to travel from tram to tram between the Metropolis and the University.

A SYNAGOGUE is about to be erected in Fieldgate Street, Whitechapel, near the Great Eastern Railway Company's dwellings. The contracts have been signed, and the work is to proceed at once. The architect for the building is Mr. Wm. Whiddington, of 71, Queen Street.

The well-known timber merchants of the North, "Bennetts Limited," have purchased a large site in Trafford Park, Manchester, near the Ship Canal. The contract for their new offices on this site has been given to Messrs. Wilson and Toft, builders. Mr. Charles Heathcote, Manchester, is the architect.

The Chapter has met to consider the alterations and extensions in connection with St. Ninian's Cathedral, Perth. Various plans were examined, and, as a result of the deliberations, it was determined to go on with the larger scheme. This scheme involves the renovation of the choir, and making side aisles, and also the shifting of the present screen.

The interesting old tower of St. Caltwg and Illtyd Church, Neath Valley, Glamorgan, is about to be restored under the supervision of Mr. C. B. Fowler, of Cardiff. The fabric windows and roof, etc., are in a very dilapidated condition. The old battlements were bodily taken down some thirty years ago, and an unsightly erection built up above corbel table. It is intended to remove this and rebuild the upper portion on the old lines of the towers of the district, it is also contemplated to add three new bells to the existing three making a peal of six. Mr. W. A. James, of Cowbridge, is the contractor who has been entrusted with the work.

ANOTHER well-known British artist, Mr. Philip Hermogenes Calderon, has passed away. Since 1887 he was keeper of the Royal Academy, succeeding in that position Mr. Pickersgill, and resided in Burlington House where his death occurred after a long and painful illness. Mr. Calderon was born in France, at Poitiers, of Spanish parentage, his father being a clergyman. He commenced his studies at Mr. Leigh's School of Art, in London, and continued them in Paris. Had he lived a few days longer he would have celebrated his 65th birthday. His life was busy one, and the list of paintings, chiefly historical and imaginative, which he exhibited at the Royal Academy since 1853, extensive. Many of them have found place in leading Art galleries. Among his works are the "Burial of Hampden," "The Orphans," "Joan of Arc," "Ruth and Naomi," "Demande en Mariage," "Les Coquettes," "The Waters of Babylon," also many portraits and water-colours. From the Paris International Exhibition in 1867 he received the medal awarded to English Art, and was a Knight of the Legion of Honour.

HOLYWELL.—The new Intermediate School at Holywell, Flintshire, is built in the domestic Tudor style, of red Ruabon brick and terracotta dressings, and is roofed with Nantile

green slates. It stands on an eminence overlooking the estuary of the Dee. The building is in two sections, being divided by a large assembly hall. The contract was let for £2500 to Mr. Matthew S. Rogers, builder, Flint, who has worked from the designs of Messrs. Grierson and Bellis, architects, Bangor.

HUDDERSFIELD.—A Liberal Club has been opened here. The principal entrance is in Westgate. On the ground floor are a porter's room, a telephone room, cloak room, and lavatories. The walls of the entrance hall have been painted in a warm brown red, and stencilled so as to give a rich appearance. The principal staircase leads to the first floor, on which are most of the chief rooms. There is a large smoke-room. Adjoining it is a writing and reading room; and beyond that a "still" room, the office, small dining room, a larger dining room, and a hot-plate room. On the floor above there are two billiard rooms, a card room, rooms for the committee and for the secretary. There are on the upper floors the kitchens and servants' rooms. The furnishing of the rooms has been carried out from designs supplied by Mr. G. Faulkner Armitage, of Altrincham, near Manchester, and Mr. F. Armitage has superintended the work of furnishing. The contracts have been carried out by the following firms:—Painting and decorating, Messrs. W. and P. Holroyd; tables and chairs for the dining, smoke, card, and reading and writing rooms, sideboard for the dining room, and bookcase for the reading room, Messrs. Hobson and Son, Limited; ironmongery, &c., Messrs. T. A. Heaps and Co.; plumbing, sanitary appliances, Mr. Thos. Armitage; blinds, Mr. Joe Heywood; structural alterations, Mr. F. Calvert, Moldgreen; and electric lighting, Messrs. T. W. Broadbent and Co.

LEWISHAM, S.E.—A new priests' vestry is to be added to the Church of St. Stephen, Lewisham, one of the late Sir G. G. Scott's erections, at a cost of about £160. The architect for the alterations and additions is Mr. Philip A. Robson, 9, Bridge Street, S.W.

LINCOLN.—A new mission hall for the parish of Monks' Liberty, Lincoln, has just been opened. The hall is a simple red brick building, covered with red tiles, and having as little ornament as possible. It affords seating accommodation for 200. The total cost is between £700 and £800. Mr. C. Hodgson Fowler, Durham, was the architect, and the builders were Messrs. M. Otter and Co.

LIVERPOOL.—A movement is on foot to erect a cathedral mosque in true Saracenic style in Brougham Terrace, West Derby Road. Mr. J. H. McGovern, of Liverpool, has made the designs and prepared the plans. The khan will have a frontage to Brougham Terrace, and at the rear of the hostel will be a terrace, courtyard, and central dome tomb. Facing Baker Street and at the corner of Marsden Street the cathedral mosque will be erected at an estimated cost of £6000. Fully 1500 persons will find accommodation in the mosque. Owing to the position of the site, special treatment has been given to it by Mr. McGovern, the architect, so that the Mihrab, or niche for the Koran, which really constitutes a mosque, shall indicate the Kiblah, or direction of Mecca. The mimbar (pulpit) and dikka (tribune) will follow the same direction. Above the aisles will be the galleries, exclusively used by ladies. There will be two minarets in Baker Street. The north one will form the main entrance, and from the south one the azan, or call to prayer, will be given. A third minaret will be situated in Marsden Street. The flat iron concrete roof of the building is to be crowned by a Saracenic dome, which will differ from the Italian dome in its geometrical form.

Two years and a half have been occupied in the construction of the new Central Fire Station, Hatton Garden. The new station is lighted throughout by electricity. The engine-house, stables, general offices, and superintendent's office are situated on the ground floor, and may be approached from either front or rear, the superintendent's office being con-

nected with his private residence, which immediately adjoins it. The first floor is set apart for the night rooms of the firemen and mounted police. From the sleeping room to the engine house runs a brass rod, down which the "on-duty" firemen will slide when alarm is received. There are two spacious kitchens on the second floor, a dormitory for the men not actually on duty, but who will be within call in case of emergency, and bathrooms and lavatories of modern design. The brigade have now at their disposal a hose tower 90ft. in height. The horses are stabled immediately in the rear of the engines.

LONDONDERRY.—A special meeting of the Governors of the Londonderry District Lunatic Asylum has been held to consider the plans and estimates for the new asylum at Granshaw. A letter was read from Mr. Roberts, architect, in which he stated that the plans had been revised by Messrs. Owens and Fuller, with a view to bringing the cost within the amount which the Governors had approved of being expended, £110,000. These plans as revised were now submitted for the consideration of the Board. The estimate for the design amounted to £118,341, and this being an excess of the amount referred to, further reduction had been made by means of which the cost had been reduced to £114,370. But if the Governors considered a further reduction absolutely necessary, a saving of £1700 could be effected by omitting a section of the chronic block on the male side, and probably as the new temporary building would afford accommodation for the same number as this portion of the chronic block would, the Governors might consider it desirable to adopt this revision, which would reduce the total cost to £112,677. He thought it right to state that the revision of the design for the asylum had received very careful consideration from the inspectors and from himself. The plans provided in the most approved and economical form the accommodation required, and the cost of supervision and maintenance in the working of the institution had been most carefully considered. But owing to the increase in the cost of building which had taken place during the last three years, it was difficult to keep the cost of building the asylum within the limits originally contemplated. It was proposed to construct the building altogether of brick in a plain and substantial manner, heated by hot water circulating at low pressure and lighted by electricity. It was decided that notice of motion to rescind the resolution on the minutes with reference to the previous plans should be given at the next monthly meeting.

MAGHERALIN (Ireland).—A new tower and peal of bells in connection with the parish church have just been dedicated. The tower is finished with red sandstone corners and ornamental terminals, and was erected by Mr. J. Campbell, builder, Belfast, under the superintendence of Mr. Drew, architect, Dublin. The bells were cast by Messrs. Taylor, Loughborough.

MANAFON.—The Parish Church at Manafon has been restored. The walls of the east end of the building, which were found to be badly cracked, have been repaired and strengthened by the addition of two buttresses. All the old floors have been relaid—the chancel and sacristy with glazed encaustic tiles, the aisles with red tiles, and under the seats with wood blocks. New heating apparatus has also been put in. The church is entirely re-seated in oak, and two new prayer desks have been added. An oak traceried screen has been placed across the church, forming the chancel, and a lych-gate has been erected at the entrance to the churchyard. All the woodwork is of oak, and the stone has been obtained from the Welshpool quarries. Additions to the furniture of the church are a carved oak pulpit and a fine oak eagle lectern. The work of the restoration has been carried out by Messrs. J. Ward and Sons, Uttoxeter, under the superintendence of Messrs. Douglas and Minshall, architects, Chester.

MARKINCH.—The new United Presbyterian Church at Markinch has been opened. The architect is Mr. Hippolyte J. Blanc, who has adopted the Early English style of Architecture. The building consists of a nave, with transept and aisle, and besides the church proper, which will seat about 500, there are the hall, capable of holding fully 100, vestry, and other conveniences. The building has cost about £2800.

MORECAMBE.—The driving of the last pile in connection with the construction of the Morecambe West End Pier has marked the completion of a scheme, the cost of which is estimated at £60,000. The total length of the pier from the entrance on the promenade is estimated at about three-quarters of a mile, the pierhead being carried out well into deep water. The head of the structure covers about half an acre, and at the sides there will be three landing stages, whilst the top will be utilised for dancing. On this portion it is intended to erect a large bandstand, ladies' and gentlemen's cloak-room accommodation, shelter and temperance refreshment saloons. The contractors are the Widnes Iron Foundry Company, and the architects Messrs. Magnall and Littlewood, of Manchester. Altogether, 198 piles have been used in the structure.

PERTH.—A new consumptive hospital is to be built at Perth. The buildings are proposed to be set so as to have the sun in the rooms all the day long. They are in three blocks, the centre one being the administrative, and the side ones the hospitals. Mr. J. Murray Robertson, Dundee, is the architect.

TERENURE.—The foundation stone has been laid of a new Roman Catholic Church (St. Joseph's) at Terenure. The church will comprise nave, side aisles, transepts, side chapels, spacious sanctuaries, and two sacristies, with heating chamber. The total length will be 120ft., with a width of 30ft. The aisles on each side of the nave will be 48ft. long and 14ft. wide. The height from floor to ceiling will be 51ft., and from floor to apex of roof, 63ft. The columns throughout in the internal arrangement of the building are to be of polished red Aberdeen granite. The height of the spire will be 160ft., and the style of the entire building will be Romanesque. The architect is Mr. Wm. H. Byrne, of 20, Suffolk-street, and the builders are Messrs. Michael Meade and Sons, Great Brunswick-street.

USK (Mon.).—The Grammar School at Usk is to be transformed into an Higher Grade School, and sundry alterations are thus necessitated. The plans have been approved by the Education Department and also by the Scholarship managers; and the work is to proceed immediately under the superintendence of the architect, Mr. P. A. Robson, of Palace Chambers, Westminster. The lowest tender has been accepted from Mr. John Morgan, of Blaenavon, for £487.

WELLINGTON.—All Saints Church, Wellington, is to undergo extensive alteration and repair. The plans have been prepared by Mr. Dalgleish, of Wellington. It is proposed to remodel the interior altogether. At present the wide expanse of plain-coloured walls and ceilings gives the church a somewhat gloomy look, and this will be much modified. The existing unsightly iron columns will be cased with marble, making them more massive and attractive. The new columns and entablature will be of the Doric order on the ground floor and of the Corinthian order above. One new feature will be a lofty and imposing oak screen separating the chancel from the nave, and forming a morning chapel and chamber for the organ.

WOOLWICH, S.E.—A scheme for the alteration and adoption of the National Schools of St. John, Woolwich, has been prepared. It is anticipated that a small outlay will bring them up to modern requirements. The architect for the reconstruction is Mr. Philip A. Robson, of Blackheath, S.E., and Palace Chambers, Westminster, S.W.

Under Discussion.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on the 2nd inst., Mr. W. Worby Beaumont, President, in the chair, the discussion on the paper "On the Protection of Underground Water Supplies," read by Mr. John C. Thresh, D.Sc., M.D., at the last meeting, was resumed and completed.

SANITARY INSPECTORS AT SWANSEA.

A meeting of the South Wales and Monmouthshire Sanitary Inspectors' Association was held recently at Swansea under the presidency of Dr. Williams, health officer to the county council. A paper on "The Construction of House Drainage" was read by Mr. Llewelyn Davies, chief sanitary inspector to the Swansea Corporation, and it was followed by discussion. Mr. David Jenkins, chief port sanitary inspector at Cardiff, also read a paper on "Port Sanitary Work."

THE INSTITUTION OF CIVIL ENGINEERS.

The Council of the Institution of Civil Engineers has made the following awards for papers read and discussed before the Institution during the past session:—Watt medals and premiums to Messrs. H. L. Callendar and T. Nicolson, B.Sc.; a Telford medal and premium to Mr. A. H. Preece; George Stephenson medals and premiums to Messrs. Whately Elliot and W. O. E. Meade-King; a Crampton prize to Mr. E. W. Anderson; Telford premiums to Messrs. L. B. Atkinson, Henry Fowler, and L. Strange.

DRY DOCKS.

At a meeting of the members of the Belfast Natural History and Philosophical Society, in the Museum, College Square North, Mr. James Maxton, M.I.N.A., M.I.M.E., read a paper in which he gave a brief but comprehensive outline of the evolution of dry docks. In comparing the advantages of the floating dock to those of the graving dock in a harbour at Belfast, he said the former was much cheaper than the latter, and the price can be infinitely stated at the commencement of the tract. It was a self-contained structure, not being affected by doubtful foundations, upward land springs, or the nature of the ground at all. Hence no contingent allowances are required.

LIVERPOOL ENGINEERING SOCIETY.

The annual general meeting of the Liverpool Engineering Society was held at the Royal Institution. Mr. John A. Brodie was elected president, and Messrs. A. B. Holmes and A. F. Aspinall vice-presidents, for the forthcoming session. Mr. A. Musker was appointed honorary librarian, Mr. C. S. Pain a re-elected honorary treasurer, and Mr. C. F. Annett was again elected honorary secretary. The annual report stated that the membership of the Society numbered 384, as compared with 363 at the close of the previous session. The treasurer's statement of accounts showed that at the close of the year there was a balance in hand of £236. Mr. Andrew Hamilton, M.I.N.A., read an interesting paper on the subject of "Diagrams as Illustrating Ship and Engine Performances."

AN ANCIENT SCOTTISH CHURCH.

The Aberdeen Ecclesiological Society recently had the pleasure of hearing a communication by the Rev. W. Macleod, Buchanan, relating to discoveries at the site of an ancient church on Lochmood. The paper described the discovery, an excavation had been made, of the doorway of the ancient church of the parish. The building was abandoned as a place of worship long ago as 1621, it being then in a ruinous state. Subsequent excavations revealed a stone door, with other interesting parts of the ancient fabric. Mr. Macleod indicated that he intends to have the discoveries examined and reported on by a competent architect.

NEWCASTLE OLD TOWN WALLS.

At a meeting of the Newcastle Society of Antiquaries, Mr. R. O. Heslop referred to the discovery, during the excavations at the Guildhall, of part of the old town walls. In the first place, the workmen found three large balls of sandstone, and a second discovery resulted in the finding of four more balls; and as the work proceeded, outside, and at a depth of 3ft. to 4ft., a complete nest of fourteen of these sandstone balls was found. The curator had been able to secure the greater part of these finds for the Castle, and they were now in the guardroom. They were in possession of a good many of these sandstone balls previously, and visitors frequently said, banteringly, that they had come from ornamental garden posts. The stones were found just at the place where they would gravitate from the Half Moon Battery and become embedded in the sand of the Sandhill; and this showed that they were missiles fired either from the Keep or from the walls of the Castle. Some of the smaller stones already in the Castle, which had been dredged from the Tyne, were marked with the Roman figure XII., and some of the balls just found bore the corresponding numeral. The smallest stones measured 12½ in. in diameter. The largest was 21 in. in diameter, but that was rough-hewn, and was probably intended for the next size, 20 in. in diameter. There were no fewer than nine of these 20 in. balls. The balls weighed from 3cwt. to 4cwt., and the catapult by which they were thrown must have been very great indeed. Probably the stones were used for defence; rolled along the parapet into a shoot, they would form a formidable weapon of defence.

ECCLESIOLOGICAL GLEANINGS.

At a recent meeting of the Aberdeen Ecclesiological Society, the President, Rev. Dr. Cooper, read a paper on "Ecclesiological Gleanings from Dr. Crammond's Session Records of Elgin." He proposed to deal more particularly with references to the ecclesiastical buildings in which Elgin and its neighbourhood was rich. Referring first to Pluscarden Priory, he said that building was in use in 1584, the year in which the records of the parish kirk of Elgin began. The Priory was one of the great churches of the district at the Reformation. Dr. Cooper then proceeded to deal with the ecclesiastical buildings in Elgin at the time of the Reformation—St. Giles Kirk, the great Cathedral of Moray, Blackfriars, Greyfriars, and the Chapel of Our Lady, on Lady Hill. The cathedral, he said, seemed to have been abandoned as a place of worship at the Reformation. He noted, however, that the Session Records recorded the interesting fact that divine service was conducted in the building on so late a date as Sunday, 21st April, 1644, and on the following Sunday, proving that the ancient cathedral did not suffer at the hands of the Reformers, but from the cold neglect and indifference of later generations. The records show that for upwards of 200 years after the Reformation, the cathedral continued to be frequented by persons who went either to pray or to amuse themselves. St. Giles Kirk was old in 1560, and it had been designed for quite a different form of worship from that now introduced. Hence the records contain numerous references to alterations on the fabric of the church. One entry records that the people taxed themselves to the amount of £100 for the purpose of providing a bell.—At the close, in commenting on the neglect from which Elgin Cathedral had suffered, Mr. Sibbald condemned the practice of charging for admission to Glasgow Cathedral.—Mr. Patrick Cooper thought they should protest against the Government charging for admission to such buildings as Glasgow Cathedral, St. Giles Church, Edinburgh, and the Cathedral at Dunblane. It was a disgrace to the country.—Dr. Cooper also strongly denounced the system, particularly with regard to St. Margaret's Chapel at Edinburgh Castle. This building, certainly one of the most interesting places in Edinburgh, had been turned into a booth for the sale of photographs.

Views and Reviews.

"THE SCULPTOR."

We have received the numbers for March and April of that new monthly magazine, "The Sculptor," and they are most creditable productions. The illustrations are well done. The magazine's aim is to give effective representation to the sculptor's art. It is not limited to any school or country. The April number contains articles on the Alfred Millenary, Egyptian Sculpture, Flaxman, the Milton of English sculptors, the Work of the Thornycrofts, the Composanto at Genoa; Sculpture in Poetry and Fiction, Art as a Mirror of Civilisation; besides which there are many short articles on both the practical and artistic sides of sculpture. The magazine is beautifully printed on good paper, and its price is sixpence.

"The Sculptor," The Sculptor Publishing Co., 20, Bucklersbury, E.C.

Enquiry Department.

"SPECIFICATION"

Enquiry and Legal Departments.

The replies to queries in the "Enquiry" and "Legal" Departments of the "Builders' Journal" being necessarily limited by consideration of space, readers who wish to obtain more complete and exhaustive answers are recommended to apply to the "Legal" and "Enquiry" Departments of "Specification."

Legal advice and opinions on Professional and Constructional matters will promptly be sent through the post.

Rules with regard to these enquiries will be found on page 2 of "Specification."

Terms of Subscription:—12s. per annum, payable in advance, for the first four quarterly numbers, carriage paid to any part of the United Kingdom. Subscribers abroad are requested to remit an additional 2s. 6d. to cover the extra cost of carriage.

I. C. B. — Will I. C. B. please send us his address? We hold letters which we are unable to forward.

TO BUILD A VILLA.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Your recent correspondent, I. C. B., gives the size of a house he requires a working plan for. The dimensions of the rooms, put into working order, would cube out at about 24,000ft., which at the moderate sum of 4d. per foot, means £400. This he asks for at a sum of £250 to £200.—Yours truly,

A. B.

INSTITUTE EXAMINATIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly tell me the best way to obtain particulars of the R.I.B.A. examinations, and of how to become a student?—I am, yours truly,

STUDENT.

All necessary information is given in the Institute Kalendar for 1897-8, which is to be had on application to the Secretary, R.I.B.A., 9, Conduit Street, Hanover Square, W. The price is half-a-crown.

An inquiry on behalf of the Local Government Board has been held respecting an application by the Bootle Corporation for permission to borrow £2734 for street improvements.

Trade and Craft.

MESSRS. ROTTMANN AND CO.

Messrs. Rottmann and Co. inform us that they have taken additional premises at 25, Garlick Hill (adjoining 26), where they will exhibit their latest novelties in mural decorations for the new season.

MESSRS. ESSEX AND CO.

We have received from Messrs. Essex and Co., the well-known wall paper manufacturers of Westminster and Battersea, their book of new season's designs, which forms a portly volume of decidedly artistic excellence. The book comprises samples ranging in price from 6d. to 8s. per piece, and includes specimens of leather, tapestry, silken, raised flock, cretonne, sanitary, and oil-painted papers, in addition to which there are lithographs of the majority of the designs at about one-eighth of full size, of about 1½ in. to the foot, which are decidedly helpful to those making a selection for furnishing purposes. One of the best designs for a sitting-room is that known as the Bertha, with a trail frieze; and another for similar use is the Maisie design, with a Lancelot frieze. A bold dining-room design is the Aurora, with the Myra frieze, while the Malmsley would go well on staircase and corridor walls. We have selected these at haphazard, but the book is full of good things, which will be obtainable till the end of 1899.

MESSRS. COLLEDGE AND BRIDGEN.

The 212 pp. illustrated catalogue, issued by Messrs. Colledge and Bridgen, of Church Lane, Wolverhampton, is indicative of the very extensive business of the firm as builders' ironmongers, and hardware merchants. A list of buildings where the locks and fittings, which are a special feature of the firm's productions, have been fixed, shows that not only in London, but in the chief towns throughout the provinces, they have commanded great attention. That Messrs. Colledge and Bridgen have established a reputation for themselves in this respect may be better realized, perhaps, when it is stated that no less than eighty pages of their catalogue are entirely devoted to locks and door furniture, including all kinds of rim and mortise locks, stock or plate locks, gate locks, night latches, padlocks, cupboard locks, &c. The firm has a remarkably large selection of handles, finger plates, letter-box plates, centre door knobs, and knockers of an ornamental and plain design. Bolts of all sizes and descriptions are also stocked, as well as sash and casement fasteners and handles, and other window fittings. Hat and coat hooks, and other household fittings which the builder is sometimes directed to supply and fix, are included in the specialties of Messrs. Colledge and Bridgen. Brass and iron butts, from the smallest to the largest size, are catalogued, and likewise brass stair-treads, ventilators, gratings, cast-iron air-bricks, manhole covers and frames, &c. Cisterns, hot and cold water apparatus, and sanitary appliances are amongst the goods supplied from this firm, who also keep a stock of kitcheners and register stoves among their many other house requisites.

PREVENTION OF BOILER INCRUSTATION.

From time to time experiments have been made with a view to finding a means of preventing the formation of incrustation in boilers, and the Carbotron Heating Company, of London and Derby, are the patentees for the United Kingdom of a system which is said to

be effective and reliable. The process consists of the use of chromate salt (bichromate of sodium), which is added in small quantities to the feed water. The calcium contained in the water, in the form of bicarbonate or sulphate, is thrown down in the form of a light sediment at the bottom of the boiler; but the inside surface of the metallic shell remains perfectly clear, without being attacked or corroded in the smallest degree. The sediment thrown down can at once be removed by blowing out the boiler, as it does not adhere to the walls so long as the water contains sufficient chromate salt, and therefore is not detrimental. Neither will an excessive use of chromate salt damage the boiler connections or the packing materials. The advantages of such a system must be obvious, both in the working and wear of the boiler, and in the saving of fuel and the cost of boiler cleaning. The right to use this patent process must be obtained by license from the Carbotron Heating Company.

MESSRS. W. RICHARDSON AND CO.

An excellent series of illustrations of horticultural buildings has been issued by Messrs. W. Richardson and Co., horticultural builders and heating engineers, of Darlington. The first view is a conservatory erected at Oxford, and which was awarded first prize and gold medal at the International Horticultural Exhibition at Earl's Court, in 1892. The design is of a building of 19ft. 6in. in length and 16ft. wide, with four gables, turret, and ornamental details. Several views are shown of other conservatories, attached and detached, constructed in different parts of the country, all of which show skilful execution in design. Other views illustrate the style of work carried out by Messrs. Richardson and Co. in the erection of fruit and plant houses, greenhouses, vineries, band stands, and winter gardens, amongst the most prominent being the two conservatories and band stand constructed by them in the public park at Newport, Mon. and the winter gardens at the Harrogate Hydropathic, and in the public park at Hanley, Staffordshire.

MESSRS. J. D. F. ANDREWS AND CO. LTD.

It is considered that we, on this side of the Atlantic, have been somewhat slow in our appreciation of the value of electricity, but it cannot be denied that to-day electrical work is engaging greater attention than ever previously in this country. In the competitive race the firm of J. D. F. Andrews and Co. Ltd., of the Fulham Electrical Works, Putney Bridge Station, S.W., hold a good position. The patentees of several fittings and systems, they specialise in nearly all branches of electrical work. A speciality is their process of concentric wiring, of which they are the inventors, which is recommended for every kind of installation, as being more economical than the wood casing. The security, double, and conduit wiring systems, for which the firm hold patents, are also highly recommended. Amongst the fittings they have introduced is a new conductor, known as Andrews' Patent Kopperklad, being an insulated conductor enclosed in a copper tube; and the Pull-push Wall Switch, which has a snap action, and is stated to possess unique advantages for contact breaking. The firm has also patented improved distributing switch and fuse boards, and a controlling switch board, the last mentioned being intended for accumulator and dynamo combinations, and combinations of dynamos, shunt or compound. Its principal feature is its simplicity and compactness, it having been designed in such

a way that the engineer can easily ascertain the exact position of the relation of the apparatus. The Andrews' inventions also include two ventilated resistances, designed to occupy little space, and to keep cool. One known as the Louvre pattern, and is for use in cases where the resistance must be stood upright or placed flat against the wall; and the other is the chimney-pot pattern, in cases where the resistance can be placed projecting from the wall or over the space behind the controlling board. The firm possesses several other patents, both for electric-light installation and for telephonic communication.

The Brighton Sanitary Committee have instructed the Borough Surveyor to prepare amended plans and estimates for the artisan houses to be erected on the Lewes Road site, showing a room in the roof instead of back offices, in accordance with the proposed new building bye-laws, and also showing kitchen and scullery combined.

A LOCAL GOVERNMENT BOARD inquiry has been held at Dublin into the applications for loans by the Dublin Corporation of £1300 for converting the site of Green Street Prison House into an open space; £1000 for repaving Bachelor's Walk; £3000 for concreting certain paths; £1900 for new paving; £4800 for repaving; a further sum of £2700 for concreting footways, and £364 for asphaltting.

A SPECIAL meeting of the Liverpool Finance Committee has been held to consider designs for the redecoration of the Town Hall. Originally, designs were obtained from local tradesmen for the interior embellishment of the hall, but the City Council declined to accept any submitted, and it was decided to commission Professor Simpson to furnish designs. These have been on view at the Town Hall.

WRITING to the Times, "A Non-Competitive says: "The distinction of being 'hung' by the Royal Academy is one that lack of space enables the few to realise, yet many pictures are accepted and at the last 'crowded-out'. Could the Committee not be induced to make some official acknowledgment of these works as distinguished from the 'rejected'? might be of the utmost value to unknown struggling artists, as well as serve in a great measure to soften their disappointment, if full list of the names of the 'crowded-out' were once in each season published in your columns. Surely the extra trouble involved to the Hanging Committee would be well repaid by the gratitude such action on their part would invoke?"

LONDON.—For work at "Gwynne House," Woodford, E. Mr. Herbert Riches, 3, Crooked-lane, King William-street, London, E.C., architect:—

T. Osborn and Sons, Work to greenhouses, stabling, etc. (accepted) ... £390
W. Tagg, General decorations to house (accepted) ... 250

LONDON.—For the erection of the "Lord Clyde" public-house, Leyton, E. Messrs. Foulsham and Herbert Riches, 3, Crooked-lane, King William-street, London, E.C., and Bromley-by-Bow, E., architects. Quantities supplied:—

T. E. Mitchell ... £4,516 | A. Porter ... £4,457
Harris and Wardrop ... 4,620 | S. R. Lambie ... 4,493
T. Goodall ... 4,581 | G. Dearing and Son ... 4,370
J. and H. Cocks ... 4,565 | G. E. Todd and Co. ... 4,327
T. Osborn and Sons ... 4,498 | Percival Hart* ... 4,151
*Accepted.

LONDON.—For repairs to shop premises, Newington Green-road, London, N. Messrs. Foulsham and Herbert Riches, 3, Crooked-lane, King William-street, London, E.C., and Bromley-by-Bow, architects:—

B. Blissenden (accepted) ... £205.

RESPECTABLE BUILDERS WANTED
R—to cover Fourteen Plots of Land at Broadstairs. Close to sea. Liberal advances.—Plans, &c., of A. J. SHEFFIELD, 35, Eastcheap, E.C.

FOR SALE, a large quantity of NEW BROKEN DUTCH TILES, suitable for lining lavatories, passages, &c.—Apply to R. C., 20, Great Titchfield-street, W.

R. I. B. A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

ARCHITECTURAL INSTITUTE and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, personally, or in residence. Fourteen first places.—G. A. T. MIDDLETON, 19, Craven-street, Strand, W.C.

PARTNERSHIP.—Young ARCHITECT, good London training, DESIRES WORKING PARTNERSHIP in established firm. Is an able designer and draughtsman, with good practical experience.—Address ARCHITECT, care of J. R. Farrar, Esq., Solicitor, Halifax.

Agency Offices—1, FENCHURCH AVENUE, LONDON, E.C.

GREAT SAVING OF COALS BY USING THE TUBULAR BATH BOILER CO'S RANGES

In which COAL or GAS can be Used.

NOTE.—The Tubular Bath Boiler Co's Range is the most Economic, most Simple, and the most Expeditious Method yet discovered for Heating Bath and Domestic Supply, by either Coal or Gas, without affecting the cooking capacities of the Stoves.

It is recognised by the Leading Architects and Builders to be a

REVOLUTION IN WATER-HEATING.

The Company has patented an unique invention, whereby

NO FURRING OR DEPOSIT IN PIPES IS POSSIBLE.

Inspection of these Ranges is Invited.

CIRCULARS GIVING ALL PARTICULARS ON APPLICATION—

184, GRAY'S INN ROAD, W.C.

WILSON'S PATENT "Safety" Pavement Lights.

PREVENT SLIPPING. Lead Frames.

Level Tread for the Foot. Deaden the Sound. Do away with Studs.

Used at Hammersmith Town Hall and elsewhere.

WILSON'S PATENT DRIPLESS Lights.

Prevent Condensation Falling.

Used at North British & M. I. Co., Threadneedle St.; Commercial Union I. Co., Cornhill; Bankers' Clearing House, and elsewhere.

WILSON'S "DIOPTRIC" Lenses.

Utilise double the light of any other. Cost the same as semi-prism.

WILSON & CO., 24, HARRISON STREET, GRAY'S INN ROAD, LONDON, W.C.

A SPLENDID ART GIFT.

VOL. TWO OF THE Architectural Review

NOW READY. PRICE 5/6.

WHAT THE PRESS SAY OF "THE ARCHITECTURAL REVIEW."

"That stately publication! THE ARCHITECTURAL REVIEW. . . . Thanks to that new and sumptuous monthly periodical, THE ARCHITECTURAL REVIEW, compensation is at last accorded to the neglected Architects. . . . This noble number."—*London Daily News*.

"The Number more than maintains the excellence of its predecessors. . . . The whole emphasis of this Magazine is laid upon taste and thought; it attempts to get down to fundamental principles in use, stability, and beauty, and to offer suggestions which are worth considering even by the masters in—for they are drawn from the masterpieces of—the science and art of building."—*The Speaker*.

The Volume contains over 300 Pages of Letterpress
and 258 Illustrations.

The Artists who have Illustrated this Volume are :

Sir E. J. POYNTER, P.R.A.
GEORGE C. HAITÉ, R.B.A.
THOMAS R. MACQUOID, R.I.
R. PHENÈ SPIERS, F.S.A.

An Architectural Causerie.

Architect and Engineer
at the A.A.

A MOST inter-
esting discussion

was held at an
architectural Association meeting a short time
ago on the relations between the architect and
the engineer. It seems to have been generally
agreed to by everyone that the present-day
architect is expected to know and to do too
much; and that, taking into account the many-
sided functions he is called upon to fulfil, it

tural design necessitates being a specialist
in construction. An artist in construction
who cannot construct is an impossible
absurdity—a contradiction in terms. If
he has not the knowledge to construct
in steel and iron, why does he use these
materials? So far as they are concerned,
he is no architect at all. To cover up
another man's construction with a piece
of decorated fibrous plaster is not Archi-
tecture; the Architecture lies in the con-
struction. If the engineer would only feel
as well as think, he would be the architect.
There is a saying—attributed to Mons.
Charles Garnier—that "an engineer is an
architect who has not completed his educa-
tion." If engineers in this country could
only realize how little knowledge and skill is
required to produce what passes for Archi-
tecture nowadays, they would soon complete
their education, and we should find our occu-
pation gone. It is, perhaps, an open question
whether iron is, after all, a suitable material
for building purposes; that is, for buildings
of a permanent and monumental character.
Many architects do not think it is, and there-
fore do not use it. Such an attitude is con-

temporary, for it is natural for man to take a
delight in the work of his hands. The men
who build such structures might well have a
special name to distinguish them from archi-
tects, only there does not seem to be any
particular need for them. A good work of
Architecture is just as convenient, just as
scientific—in fact, includes every excellence
of a work of engineering. Why then have
the less, when we can have the greater?
Why put a lighthouse, for instance, into the
hands of a man who looks upon its erection
as a purely commercial or professional trans-
action, when it might have been given to
another, just as scientific, just as practical,
but who added to that a passion for beauty,
and a capacity for sacrificing himself and his
interests to obtain it? A. R. J.

Colour of Materials in Architecture.

In passing through
an English town we
are continually
brought face to face with new buildings
which irritate us by their lack of form and
unhappy combinations of colour. It would

SIR WALTER RALEIGH'S HOUSE AT YOUGHAL. IN ILLUSTRATION OF "A PICTURESQUE IRISH SEAPORT."

out of the question that he should be able
to compete, on his own ground, with the
specialist in construction—the engineer.
Therefore let the architect avail himself of
the special knowledge of the engineer; let
the bonds of friendship, of mutual co-opera-
tion, be drawn closer; so that the specialist
in construction and the specialist in design—
the man of Science and the man of Art—
may combine to produce a superior building,
to the honour and glory and material advan-
tage of both. Such a conclusion as this,
though it seems at first sight to be eminently
sensible and reasonable, is yet really based
on a total misconception of the true nature
of Architecture; and although, in the present
confusion of ideas and absence of knowledge,
such a division of labour may have some
practical value as a temporary makeshift, yet
it is a settled policy—as an ideal—it leaks
nowhere, and is calculated to destroy the only
raison d'être of the architect. The archi-
tect is an artist—that has now come to be
understood; but his art is the art of build-
ing, of construction—that seems here to be
overlooked. To be a specialist in architec-

ture is not fit for use there is no
need to be acquainted with its properties;
but if it is fit for use it must be understood,
and forms must be given it suitable to its
nature and functions. To build with iron in
this way is Architecture, just the same as to
build with stone or brick or wood. There is,
therefore, no need to invent a new name for
it. There is no doubt that, in this age of
keen competition, the architect, like the
student of science, finds it necessary to
specialise; to limit his activities as much as
possible to one thing, so that he may excel
in that. But is he going the right way
about it in handing over construction to
the engineer? Architecture no doubt is
a strenuous calling; it is no fit occupa-
tion for the weakling or the dullard,
but if a man confines himself to the real
essence of his work—the art of construction
—and does not waste his time and energies
on surveying, estate agency, ancient lights,
&c., a competent knowledge would not be
beyond his scope. It may be that there is a
demand for structures of a purely utilitarian
character. If so, it is probably only tem-

porary, for it is natural for man to take a
delight in the work of his hands. The men
who build such structures might well have a
special name to distinguish them from archi-
tects, only there does not seem to be any
particular need for them. A good work of
Architecture is just as convenient, just as
scientific—in fact, includes every excellence
of a work of engineering. Why then have
the less, when we can have the greater?
Why put a lighthouse, for instance, into the
hands of a man who looks upon its erection
as a purely commercial or professional trans-
action, when it might have been given to
another, just as scientific, just as practical,
but who added to that a passion for beauty,
and a capacity for sacrificing himself and his
interests to obtain it? A. R. J.

colour outraged our senses; add, however, the happy relation in which one material stands to another, and we get almost perfection. This selection of bricks, tiles, slate, and the different kinds of wood and stone used in ordinary building might receive more careful choosing than we are in the habit of giving to such practical matters. It is not altogether a question of sentiment that a house should be built as far as possible with the materials of the district in which it is erected, for, by so doing, the probability, all things being equal, of the building harmonising with its surroundings is enhanced. It is possible, perhaps, to carry this idea too far; for, while we may now think it advisable from artistic motives to do so, there is little doubt that the house builders of the Middle Ages built in this fashion for economical reasons, just as the modern architect fetches his materials in the majority of cases from the cheapest markets. To attribute to the mediæval builder a conscious artistic thoughtfulness in erecting his building with such materials as he found in the district is a pleasing notion, but the more we know of that period the less likely does it appear to be accurate. Difficulties of transit, and the almost complete isolation of one village or town from another, gives a more likely reason for the use of materials that were to hand. Nowadays the conditions are reversed. Experience over and over again goes to prove that stone and other ordinary materials found in the district where it is proposed to build are very often more expensive to obtain than those sent by rail some distance away, where a quarry is in full working order. However much, therefore, we might wish to use the materials of the district, the conditions of building have so changed as to render it well nigh impossible—at any rate, to the same extent as of old. The choice of colour of material should, for this very reason, be even more carefully selected when obtained from other districts. Without laying down any hard and fast rule for the ways in which colour in materials should be utilised, there are one or two methods which seem to be effective. Keep each material in masses, and not fritter away the breadth of the building by dotting the materials about the structure. Supposing the building to be mainly of brick and stone, let it be used like, say, Norman Shaw's building on the Embankment, the University Settlement in Tavistock Place, or the second premiated design for the Colchester Town Hall. Each of these buildings arrest attention by the happy use of colour in the materials employed. The simpler a building is in form, the stronger, we are inclined to think, the colour of the materials may be. Where there is a tendency to lose sight of form as a primary consideration in design, brilliant colour in the materials should be avoided. In some of Sedding's work we find a tendency to combine playful form in strongly coloured and marked materials, the result seldom being successful. Of all modern architects, Phillip Webb and Norman Shaw would seem to be the best for studying the many legitimate effects to be obtained by the juxtaposition of materials and colour in Architecture.

G. LL. M.

THE restoration of the tower of St. Leonard's Church, Malton, has just been completed. The work has cost £1400.

THE new Mission Church at Draughton has been built in the Gothic style from plans prepared by Mr. B. Emmott, of Addingham. The total cost is about £450.

A MEMORIAL WINDOW has been erected in St. Mark's Established Church, Dundee. The window consists of four panels in stained glass. Each contains a symbolic figure. The work has been executed by Messrs. Stephen Adams and Son, Glasgow.

SOME CHURCHES OF SICILY:

AND SOME NOTABLE INTERIORS.

THE Palatine chapel at Palermo, and the cathedral of Monreale, Sicily, stand among the world's most distinguished examples of sumptuousness in church interior decoration. Both are frequently cited by architectural critics as instances in which ornament, while carried to an extreme of elaboration and richness, has yet been subordinated to a devout and worshipful feeling. Both buildings survive from the period of the Norman dynasty of kings in Sicily, and both present features in the details of their ornamentation which perpetuate the Eastern style of the Saracenic period which preceded the Norman. The Palatine chapel is not a building by itself. It forms part of the group which constitute the

OLD ROYAL PALACE AT PALERMO.

It is in fact but a room among rooms, having but one entrance from the open air, and a few small windows in the lower walls. Practically the whole of the lighting is from eight windows in the cupola; the nave is thus left in comparative darkness, while the choir and chancel are illuminated, with striking effect. We cull the description of Palatine chapel given by Mr. William Agnew Paton in his book on "Picturesque Sicily." "The interior, consisting of a nave, aisles, and triple apse, is 108ft. in length, including the eastern apse, and 42ft. in width. Ten columns of Egyptian granite and Greek marble, 16ft. in height, uphold Saracenic pointed and stilted arches, which in turn support walls encrusted with mosaics; and above all is a curiously carved wooden roof resembling the vault of a cavern of stalactites in the early stages of their formation. In modelling, the ceiling reminds one of that in the Sala de los Abencerrages in the Alhambra, save that what is there pearly white is here bronzed, painted, and golden; that

SHOWING LIKE WHITEST MARBLE,

this like jasper. Five marble steps lead to the choir, over which rises a dome 75ft. in height, solidly encrusted with mosaics, except where eight windows pierce the wall. All the floors of the chapel are covered with inlaid marble plates, and the walls above 'cipollino' wainscoting, in the aisles and above the capitals of the pillars in the nave, are overlaid with exquisite pictorial mosaics, in which large quantities of lapis lazuli, not to mention more precious stones, have been lavishly used. All the mosaics are on a golden ground, ornamented, radiant with Oriental colours, harmonious, splendid. The pictorial mosaics in La Palatina, as do those in the Cathedral of Monreale, the paintings on the walls of Campo Santo, in Pisa, and the frescoes by Giotto in the Arena chapel in Padua, represent subjects drawn from the Old Testament, the life of Christ, and the lives of His apostles, particularly from the life of St. Peter, who is said to have preached in

THE PRIMITIVE CHURCH

which he established on this same site when he was returning from Africa to Rome to meet his death on the Janiculum, where is now the Chapel of San Pietro in Montorio. On the right of the nave, by the steps leading to the choir, is a pulpit (a plain cube of red porphyry with a frieze of white marble encrusted with mosaics and inlaid with dainty geometrical patterns of the same material), borne aloft on four marble columns exquisitely engraved and delicately carved. The frank simplicity of the design and the unostentatious enriching of the work are most charming. To have highly embellished the rare material of which this piece is composed would be 'to gild refined gold, to paint the lily.' By the pulpit stands a very ancient carved white candelabrum 14ft. in height. Some say King Roger imported it from the East, others that it was wrought by Norman-Sicilian artists. In either case, it bears witness to the wonderful degree of perfection to which the art of carving in stone was carried in the days when it was chiselled from the solid block. Between the shadows of the nave and the brightness of the choir,

almost directly above the steps leading to the latter, there hangs a large silver lamp, said to have been also the gift of King Roger. It is a fine specimen of repoussé work, the great size and beauty of which testify to the wealth and munificence of the donor and to the skill of his silversmiths. But in the midst of the splendour of general effect the richness even of such details of adornment is overlooked.

THE CATHEDRAL OF MONREALE,

situated about four miles from Palermo, was founded in A.D. 1174, by William II., called 'The Good,' with the avowed purpose of erecting a church which should surpass in magnificence all others in Sicily. The building was finished and consecrated in A.D. 1182. The exterior of the cathedral is very unpretentious. It was never finished, and it entirely lacks the enrichment which was bestowed on the interior. Monreale has a nave and two aisles; two rows of nine columns of Oriental granite support stilted and pointed arches, above which are nine windows in the clerestory; other windows admit light to the aisles. The choir and transept (the latter taking in the width of the aisles) form a Latin cross; the floor is here raised above that of the nave, and is reached by seven steps within a beautiful altar rail of carved marble. The nave and aisles have apses at their eastern extremities; that of the nave, in which is the high altar, is of striking proportions and impressive size; the other two, less elevated, contain smaller altars. All the openings, the

GRAND ARCHES OF THE CHOIR,

the vaulting of the aisles, the windows and doors, are of the style adopted by Arab architects of the eleventh and twelfth centuries, but in the details of construction and ornamentation Monreale belongs to no one school of art. The splendid work of Norman-Sicilian artists is 'Latin in its shape, Roman in its colonnade, Byzantine in its mosaics, Greek in its sculpture, Saracenic and Norman in its many mouldings' (and, we may add, baroque as to its restorations), exhibiting a 'most curious combination of styles.' The eighteen columns of Oriental granite are monoliths taken from Greek and Roman buildings. Some of the capitals are antique, but a greater part are of the age of the founding of Monreale. These last are of similar patterns, 'exhibiting foliage, volutes in the shape of cornucopias with figures intermixed,' and all are of the most delicate workmanship, such as the Byzantine Greeks knew how to fashion. On one capital is a curious group representing King William in the act of introducing the archbishop to the Holy Virgin, emblematic of the subordination of Church to State, a characteristically Norman way of asserting the divine right of heaven-anointed kings. The lower walls of both aisles and of the choir and apse are wainscotted with plates of cipollino, surmounted by a Saracenic trefoil of rich marble on a ground of mosaics, which, as in the portico of La Palatina, has the appearance of white satin hangings with embroidered silk borders."

A NEW wing to Salisbury School has been erected at a cost of over £2000.

ST. HELEN'S Town Council has decided to construct a subway for gas pipes, water mains &c., in Church Street, the principal thoroughfare of the town, at a cost of £6750.

THE Streets and Buildings Committee of Edinburgh Town Council has recommended approval of plans of a new bridge proposed to be erected over the Water of Leith at Bonnington, at a probable cost of £5500.

THE Launceston Town Council has approved of the plans for the new cattle market at Race Hill prepared by Mr. Horace Kittow. Accommodation will be made for 2240 sheep and about 700 bullocks, the expenditure to be limited to £3500.

THE East Sussex County Council has decided to purchase the greater part of the Hellingly Park Farm and part of the Park Wood, containing altogether about 400 acres, as a site for the proposed new asylum, and have appointed Mr. George T. Hine, of 35, Parliament Street, S.W., to be the architect.

IN AND ABOUT YOUGHAL.

BY H. F. WARING.

I.

SITUATED in the South of Ireland, at the mouth of the River Blackwater, the small old-fashioned seaport town of Youghal, seen from the coasts, presents an appearance which is decidedly foreign, and with the river reaching far away, backed by the distant hills of Waterford, the picture is one of great beauty.

The place was anciently called Eo-chaille, which signifies the forest of yew trees, many remains of which are constantly found beneath the surface of the neighbouring country. In this neighbourhood, at the beginning of the sixth century, Christianity had almost supplanted Druidism. The early preachers, however, with the hope of doing less violence to the native feelings, retained many of the olden sites and relics and changed alone their name and object. The sites deemed religious were continued as such, and the Christian Church began to take the place of the Pagan altar. In the early part of the sixth century St. Molanfidé founded an Abbey of Regular Canons at Dair-Inis, a celebrated establishment of the Druids, who found in the leafy solitude of Glendyne all the accessories required by the forms of their religion.

About the year 680 a church was founded at Eo-chaille, the old site of which is now partially occupied by the later church of St. Mary's. The doorway of this early church was built up in the thirteenth century, and an Early English window inserted in the wall above, but the outline may still be seen in the wall of St. Mary's. It is a plain circular arch, without columns or mouldings, and has not even a chamfer around its edges, the workmanship being of the rudest description.

In the middle of the ninth century a great storm broke over the country, which had the effect of changing the course of the Blackwater, its mouth being now several miles from the original situation. A few years later three Norwegian brothers landed in Ireland with a large army; Dublin was seized by one, Limerick fell to the share of the second, whilst the third built himself the city of Waterford. A detachment of these troops entrenched themselves at Eo-chaille, on the newly-formed embouchure of the Blackwater, where they built a fortress, and laid the foundations of a commercial seaport.

In the beginning of the eleventh century Christianity received a great impulse in the neighbourhood of Eo-chaille, and many small primitive chapels were rebuilt in the Norman style, many interesting relics being found in the district. The early Saxon church having fallen to decay, a large Norman church was erected on the old site. This, however, was shortly to be replaced by a still more spacious building, in order to find room for the rapidly increasing population of the now thriving town.

In 1183 the Order of the Knight Templars was confirmed, and soon after a preceptory was erected on the summit of the commanding promontory of Rhincrow, which overlooks the Blackwater. Certainly these old knights had an eye for the beautiful! The ruins of this feudal fortress are extensive, covering a considerable part of the top of the hill. Numerous heaps, overrun with bramble and covered with moss and weeds, give the outlines of a large, irregular quadrangle, and the chapel, cloisters, refectory, kitchen, and dormitories of the Pilgrim Knights may be traced. The chapel is an open ruin, measuring in the interior 58ft. by 27ft., the walls of which are 3½ft. in thickness. The lower proportions of the east window, which was wholly destitute of mouldings or ornament, are in good preservation, and in the side walls are two circular-headed Norman windows, fixing the date of the edifice. At the west end there still remain portions of the great doorway, on either side of which is a narrow lancet. Of the cloisters some low broken walls are the only remnants.

The dining hall, or refectory, forms, according to usage, a right angle with the chapel, and stands north and south. It measures inside walls 41ft. by 7½ft., and at the springing of the arch of the vaulted ceiling, which still covers in the old building, the walls are 5½ft. thick. The stones, like the rest of the material of the abbey, are very small, as if quarried on the top of the hill.

The refectory was lighted by seven deeply splayed spike-holes, four in the east wall, two in the south, and one in the north-east. There were three entrances. The great portal, which stood between the chapel and cloister, a second lesser door opening upon the cloister, and a third for servants communicating with the kitchen. This latter building, with its cellars, is at the north end of the dining hall. As was customary, over the refectory and kitchen were the dormitories, the walls of which are in part standing. From this upper floor the view of the town and harbour, as well as of the county Waterford—as far as Ardmore, is exceedingly fine.

The Collegiate Church of the Virgin Mary is of considerable interest, and was rebuilt on the site by the Earl of Desmond in 1464. It is cruciform in plan, the nave being 135ft. long and 66ft. wide, and until quite recently was the only part used for worship, the remainder of the church being roofless. The east window is in very good repair, and is an excellent specimen of the Early English Flamboyant style. On the north side, away from

FONT, ST. MARY'S CHURCH, YOUGHAL.

the church, stands a square tower 63ft. high, overlooking the town walls which are very near, and it was evidently intended to answer as well for a place of defence as for a belfry, to which it is now appropriated.

The transepts were used as chapels, and in 1606 the Earl of Cork purchased the southern one from the mayor and corporation, and in it erected a large and very quaint tomb for himself and his family.

The Perpendicular font is extremely good. It is octagonal, supported on four moulded pillars, terminating in four ogee arches, their spandrels sunk and filled in with vine leaves. In the centre of the four pillars is one of larger size, from which arches spring to the outer ones, forming a scarce example of Perpendicular vaulting, in which several arches sprung from a single central column. It has an oak ogee-shaped canopy of the Tudor period surmounted by a gilt dove. Recently this font was cleaned under the superintendence of Dr. Jones, the vicar, and Mr. Stewart, the curate, who take a great interest in their church, and during the process of cleaning eleven coats of paint were found upon it.

The chancel was unroofed by the last Earl of Desmond, who sacked Youghal in 1579, and it remained in ruins until about thirty years ago. The church formerly terminated in an apse, but this in the restoration has been done away with.

The entrance to the choir at the south side is through a recessed porch, for which purpose use is made of a large buttress with good effect. At the south side of the altar are triple sedilia and piscina grouped in one design. Opposite this is a good Perpendicular altar tomb.

The Bishop of Cloyne, as warden, has a throne in the nave, but this has no pretensions to beauty.

Although no trace of the rood screen remains, the steps which originally led up to it are still intact.

In the old portion of the building, probably the thirteenth century work, ancient masonic marks may be seen. It is generally supposed they were put there by the builders.

Adjoining the church is the house where that fine old gentleman, Sir Walter Raleigh, resided during the years 1588—89, when he filled the office of Chief Magistrate of the town. In 1602 he disposed of his Irish estates to Sir W. Boyle, created Earl of Cork; the house was afterwards tenanted by Sir Lawrence

A STREET IN YOUGHAL.

Parson and Sir William Hedges. The windows have unfortunately been modernized, and instead of the leaded lights, sash windows are inserted. The position of the staircase is also changed. From the large dining-room a subterranean passage used to connect the church tower. In one of the kitchens the ancient wide-arched fireplace remains, but is disused. The walls are mostly wainscotted in oak, which is not however improved by being covered with canvas, grained in the typical manner of twenty years ago. The present tenant, however, is taking this down. The drawing-room contains a magnificent carved Elizabethan mantelpiece, rising to the ceiling. The cornice rests upon the three figures representing Faith, Hope, and Charity, between which are enriched circular panels, and a variety of emblematical devices fill up the rest of the structure. In this room there is also some good furniture, especially a small table. I was unfortunate in not being able to get any interior sketches here, but the present tenant was away. In an adjoining bedroom is another good mantelpiece of oak with Dutch tiles, and lately, behind the wainscoting of this room, a recess was revealed in which part of the old Monkish library, hidden at the period of the Reformation, was discovered.

The grounds are remarkable for the luxuriant growth of myrtles, bays, arbutus, and various exotics in the open air, the myrtles flourishing so well here that they gave rise to the name of Myrtle Grove. Of course, the visit to the grounds is not complete without having seen the spot where the unfortunate accident to Sir Walter took place with reference to his first pipe of tobacco. Here also one is shown where potatoes were first planted in Ireland.

OUR PROGRESSIVE POLICY.

We again announce a further increase in size of "The Builders' Journal and Architectural Record." The steady progress we have made in three years—signalled, as it has been, at regular intervals, by increases in the number of our pages—has secured the appreciation of readers and advertisers alike.

It is this never-failing mark of approval which prompts us to further enterprise. In the present issue is included, in place of our ordinary four-page "Surveying and Sanitary Supplement," a special **EIGHT-PAGE SUPPLEMENT**, which it is intended shall appeal as strongly to the Builder, the Surveyor, and the Sanitary Engineer as the body of the Journal does to the Architect and the Craftsman.

We also give, as an Extra Supplement, Two Double-page Litho. Illustrations.

Our aim is to make "The Builders' Journal and Architectural Record" the most representative of the many interests bound up with the Profession of Architecture and the Trade of Building, and we believe that we have already attained an unparalleled success in this direction. In "The Builders' Journal" the subscriber has a Magazine of nearly fifty pages, all for One Penny—twenty-five per cent. below the price of the old-fashioned professional fourpenny weeklies.

ANCIENT REMAINS.

RUTHLESS DESTRUCTION IN MONMOUTHSHIRE.

THE old remains at Llanhilleth, on the mountain top between Aberbeeg and Pontypool, have been very largely destroyed. It seems that about eight years ago the inhabitants instituted a sheep and cattle fair here, which has met with some success, and, in order that more facilities for the fair might be obtained, the proprietor determined to take advantage of the glut of labour caused by the strike to put on a number of hands to completely level the old tumps, rings, &c., and pick out the stones from the old ruins to build a wall around the fair ground; and so much speed has been made that more than half of

THE TWO PRINCIPAL MOUNDS

are scattered abroad, and mounds of the stones have been formed in readiness for the proposed wall. The digging in the most westerly mound has disclosed walls, square and well built, and of considerable thickness, with an apparent doorway. At first appearance this wall seems to be built of dry stones. A closer examination discloses that they have been mortared, but that the mortar had in a great measure perished. Near here a small fragment of Roman-British pottery, and a very tiny scrap of Samian, is to be seen, but it is so little, says Mr. John Storrie, writing in the Western Mail, that it would not be safe to infer therefrom that the walls were Roman. About 4yds. further east the interior wall-face of an octagonal apartment was found,

about 8ft. in greatest diameter, but the outer wall-face had been stripped off and put on the stone pile. From the earth removed from this octagon I was able to discover a metal ring, like a button mould, and a round metal object which, when carefully cleaned, turns out to be a billon Roman Imperial coin of Trebunius having on the reverse a draped figure, with sceptre in the left hand, and holding out an olive branch with the right, the inscription being "Pax Aeterna." It is a little larger than a third brass. In Cox's "Monmouthshire," Vol. II., pp. 252-4, he says:—"At Llanhiddel (the way he spells it) we baited our horses in a public-house, and strolled in the midst of a violent shower to the church, which is situated on the summit. It is a small but ancient Gothic building, constructed in the most simple form,

WITHOUT A TOWER OR BELFRY,

the bells being under the roof, and the ropes descending into the church. The churchyard is planted with twelve old yew trees, which surround the church, and add to the solemnity of the scene. It is dedicated to St. Ithel, with whose merits or genealogy I am totally unacquainted. On the north-eastern side of the church are the remains of a fortified post, consisting of a small tumulus and a circular entrenchment, which communicated with others. Within the latter are vestiges of subterranean walls, faced with hewn stone, and no less than 9ft. thick. At a little distance to the west is a high mound or barrow. These are the remains of an ancient fortress, called Castell Taliurum by the natives, who could not explain its meaning, but said it was neither Welsh nor English. These words are supposed to be a corruption of Castrum Italiorum."

NATIONAL GALLERY.

THE DANGER OF FIRE.

A LETTER emphasizing the risk from fire run by the National Gallery has just appeared in the Times, over the name of Mr. I. H. Spielmann. The writer enumerates the inadequate safeguards in operation, and proceeds:—"The roofs and lantern-lights on the eastern portion of the building were stated not to be fireproof at the last Parliamentary inquiry into the affairs of the National Gallery, and I cannot ascertain that the deficiency has ever been remedied. There is a double roof over Barry's extension, and over Sir John Taylor's a single roof, but there is no iron setting over the skylights such as would afford a simple and effective protection against falling embers from a neighbouring fire. The floors are of wood, and the risks from such embers are obvious. Surely, situated as the National Gallery is in the midst of danger, reproof flooring is desirable. Furthermore there are, if I remember aright, two open fireplaces in the small rooms—exhibition rooms in the very heart of the Gallery.

THE ROOFS ARE COVERED WITH LEAD, and the danger of which in the event of a fire need hardly insist. The iron roof-shutters on the north side of the Turner room, which in absolute contact with the canteen end of the barracks—shutters on which so much reliance is placed—have actually been removed; and no one in the Gallery, so far as I could ascertain when I made this discovery, knew of the trick that had been played them. This matter urgently demands attention. None but those who have personally examined the building, both from below and from the roof, can fully realise the danger with which the Gallery is continuously threatened by the barracks, in which more than one outbreak

has already occurred. It is years since the Duke of Cambridge officially declared that these barracks had no strategic value, and it is now some time since the Government promised their removal. As so long a time is to elapse, may it not be asked that the canteen and married soldiers' quarters should be transferred from the house carefully selected for them against the wall of the National Gallery to another portion of the partially-occupied building? In Hamptons' block on the west, a rookery of dilapidated and highly-inflammable buildings on the north-west, and the contiguous barracks on the north, we have three distinct and separate sources of imminent danger, between them ensuring almost certain catastrophe if the wind should blow from any of these quarters. Portions of the Wellington Barracks and the Chelsea Barracks have already been gutted; probably the turn of St. George's Barracks is not far distant, when the National Gallery will possibly go with them. Yet all the Government has

done—besides promise—was done years ago, when Mr. Shaw Lefevre erected a water-pipe in the Gallery in order to put out the fire which Government would not make improbable, and thus added to the danger from flames and smoke the almost equal risk of damage from water. If a report were obtained from an expert upon this matter I have little doubt that it would prove as sensational as that which has startled the Government into rescuing South Kensington from a condition hardly more serious."

THE Town Council of Lowestoft has applied to the Local Government Board for leave to borrow £1300 for sea defence works, and £2200 for the purchase of the South Beach.

THE Llanelly Borough Council has received the sanction of the Local Government Board for the borrowing of £5000 for the raising of the sea embankment at Machynis. The Council proposed to raise the height by 3ft., but the Board of Trade stipulated for another 3ft., which will now be carried out. The work will be completed under the supervision of the Surveyor.

The Birmingham Competition.

COUNCILLORS AND THE ASSESSOR'S AWARD.

AT a recent meeting of the Birmingham City Council, Alderman Lloyd presented the report (summarised in our last issue) of the Lunatic Asylums Committee, dealing with the competition for the plans of the new asylum to be erected at Hollymoor, and for which Messrs. Martin and Chamberlain were the successful competitors. He stated that before Mr. Hine (the assessor) saw the plans sent in in the competition they were carefully examined by the two medical superintendents of the City Asylums, who also recommended the plans marked "Forward" as being more adapted to the requirements than the others. It was naturally gratifying to the committee that their original recommendation should, after being submitted to the test of competition, have been so unanimously proved to be right, and his only regret was that so much public money and valuable time had been expended on the matter, and that

SO MUCH DISAPPOINTMENT

should have been occasioned to the unsuccessful competitors. He hoped that the long-delayed work would now be allowed to proceed, and he moved that Messrs. Martin and Chamberlain be instructed to prepare the necessary detail plans for submission to the City Council and to the Commissioners in Lunacy.—Mr. Hughes seconded.—Mr. Howard Lane put a long string of questions to Alderman Lloyd, as chairman of the committee, and prefaced his inquiries by

SOUTH DOOR IN ST. MARY'S CHURCH, YOUGHAL.

an expression of opinion that there was not much disappointment among the unsuccessful competitors, because they had not much expectation of success. Each had got his £100, and some at all events did not expect anything more. The questions he put were categorical, and as follows:—(1) Did Mr. Hine, in his first report, select the plans of Messrs. Martin and Chamberlain? (2) Were there any reports of the assessor submitted to the committee which were not contained in their report to the Council? (3) If Mr. Hine advised the adoption of Messrs. Martin and Chamberlain's plans in his first report, why was there any necessity for a subsequent conference with him? (4) What were the names of the competitors who came in second and third in the competition? (5) What steps were taken to ensure that

THE ORIGIN OF THE PLANS

should not be known when delivered by the messengers of the respective architects at the Council House? (6) What guarantee have the committee that the estimate of £220 per bed will not be exceeded by more than 10 per cent. usually allowed as a margin for contingencies? (7) Why one competitor was allowed to submit two sets of plans and the other competing firms confined to one set each?—Mr. S. D. Balden, who moved the resolution which resulted in the competition, expressed himself perfectly satisfied that the committee had honourably fulfilled their agreement, but objected to the suggestion by the chairman that there had been a waste of public money. The committee had, for the expenditure they had incurred, obtained the right to appropriate the plans sent in, and to use any idea they contained, and if they did use some of the ideas and features of the unsuccessful plans, as he had no doubt they would, the citizens would be gainers and not losers by the competition. Moreover, it had probably spurred Messrs. Martin and Chamberlain to put forth their best efforts.—Mr. Murray wished to know if the committee had any idea to provide in connection with the new building separate accommodation for lunatics whose friends could afford and were prepared to pay for their maintenance, considering that there were grave objections to such patients being treated in exactly the same way as the pauper lunatics.—Mr. Hennessey declaimed against the

INFRINGEMENT OF THE RULES OF THE COMPETITION,

as he described it, in favour of Messrs. Martin and Chamberlain, by allowing them to send in two sets of plans.—Mr. Barber said a good word for the plans selected as the best of the lot for the particular kind of work.—The Lord Mayor remarked, in reply to Mr. Lane, that he was responsible for the interview with Mr. Hine, and he had desired it because he wished some further information on one or two points in the report, and that as a matter of fact three of the competitors submitted alternative plans, six competitors sending in nine designs.—Alderman Lloyd said Mr. Hine sent in only one report. The mottoes attached to the plans ranked second and third were known, and anyone who desired could find out who the authors were, but he did not think it desirable their names should be published.—Mr. Lane pressed for publicity in the interests of the architects concerned, but Alderman Lloyd stood firm, and the Lord Mayor supported him by declaring that it was entirely in his province to withhold the names.—As to the precautions taken to secure anonymity, Alderman Lloyd answered, amid laughter, that he was in Egypt at the time and could not tell, but he knew

SPECIAL PRECAUTIONS WERE TAKEN

to prevent Mr. Hine from knowing the names. There could be no guarantee as to the cost per bed, because the plans were not yet settled, and as to the alternative plans every one of the competing firms could have sent in two if they had desired, though the committee discouraged sending in more than one. To Mr. Balden he replied that he did not suggest there had been a waste of public money, but merely his own regret at the expenditure.—The resolution was then approved, and the report of the committee adopted.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

May 18th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

WITH reference to the proposed municipal buildings competition at Godalming, the Town Council has selected twelve names from the forty-seven sent in response to the advertisement issued. The selected twelve, whose names are appended, will be invited to send in drawings in competition: Messrs. Ardrow and Dawson, Westminster; C. Bell, London, E.C.; Colson, Farrow, and Nisbet, Winchester and London; J. Johnson, London, E.C.; Lancaster, Stewart, and Rickards, London, W.C.; H. Moon, Godalming; E. R. Robson, Westminster; J. W. Stevens, London, E.C.; A. H. Tiltman, London, W.C.; A. H. Verstage, Godalming; S. Welman, Godalming; Woodhouse and Willoughby, Manchester. Mr. E. W. Mountford, F.R.I.B.A., has been appointed assessor.

THE President of the Royal Academy having undertaken to prepare cartoons of St. David, St. Andrew, and St. Patrick, as a preliminary to the filling in with mosaic work of the vacant panels in the Central Hall at Westminster, there is at length a prospect of completing the scheme of decoration of which the presentment of St. George, executed some years ago over the entrance to the Lords' corridor, was the initial step. Watercolour sketches in harmony with Sir Edward Poynter's design of St. George have been in existence for a considerable period; that for St. David is the work of the same artist, and those for St. Andrew and St. Patrick are from the brush of the late Mr. Albert Moore. The cartoon elaborating the St. David design is now in so advanced a stage of preparation that Mr. Akers-Douglas hopes to see it reproduced in mosaic in the panel over the entrance to the Commons' corridor during the forthcoming autumn recess; and it is expected that Sir Edward Poynter will have finished his companion enlargements of Mr. Moore's sketches in time for the remaining panels to be filled in before Parliament meets for the Session of 1900.

It is to be hoped that the very bold, and, at the same time, most important, enterprise of the Glasgow Corporation—namely, to spend the sum of £15,000 at least upon sculpture for the front of their new Art Galleries—will not be allowed to fall to the ground; but at present a feeling of timidity seems to have infected the Committee which has it in hand, and the matter is, if not in abeyance, at all events hanging fire for the moment. The details which have been published of the proposal are interesting, and show no niggardly hand. Mr. George Frampton, A.R.A., is to

have for a bronze group £2000, for six spanrels £1800, and a supervision fee of £600. Messrs. Shannon and Young are to have £1600 for eight stone figures, and £850 for three bronze figures; whilst Mr. Lawson is to have £2800 for eight figures. The carving, which is to be placed in the hands of Mr. Aumonier, is to cost no less than £12,000. It is a bold enterprise, but it is one which we hope may be carried out, as it may give encouragement to London to do a little in the same way.

THE Burlington Fine Arts Club, to whose exhibition we have previously referred, may be congratulated on the manner in which they have filled their large room at 17, Savile Row. The seventy-five pictures which have been sent to them by various English owners show how rich the country is in examples of Early Italian Art, and illustrate most adequately, not with absolute completeness, the history of the Milanese School of Painting. Forty of the pictures shown here have never before, it is believed, been publicly exhibited. Mr. Herbert F. Cook, in his introduction to the catalogue, defines the geographical limits of the district with which the exhibition is concerned, and, after remarking on the meagreness of our materials for its Art history, describes the series of invasions by which Lombard Art was influenced. These "invaders" were Giotto, Pisanello, Bramante, and Leonardo da Vinci, whose genius successively dominated the schools of Lombardy. "It is scarcely to be expected," says Mr. Cook, "that a homogeneous art could have sprung from such diverse elements, and the task of disentangling the composite quality of the final expression of the Lombard ideal is thus unusually difficult." Milanese Art, then, was subject to several distinct influences, but most of all to that of Leonardo, who lived in Milan from 1481 to 1499, and again from 1507 to 1516. He altered the current of Art in Milan so completely that few Milanese painters entirely escaped his influence, and some would appear to have become mere imitators of the master. Mr. Cook observes that while hardly ten pictures exist that are indisputably by Leonardo, at least twenty are usually ascribed to him, of which twelve are in this room.

A GREAT deal has been said about the iconoclastic acts of the Puritans, but the churchwardens of the last century and the building contractors and restorers of our own period are responsible for the destruction of many features, both of artistic and historical interest, in our old village churches. There is no doubt that many memorial brasses have disappeared in this way. One of these—interesting to Goosnargh and to Preston—has just been restored to the old church of Goosnargh. It is no less than a memorial brass to William Bushell, the founder of Goosnargh Hospital. Some years ago, when the church was restored, it disappeared, and was eventually rescued by Mr. T. Harrison Myres, architect. Mr. Myres has had the brass cleaned, and has offered it to the vicar and churchwardens of Goosnargh, who have, of course, accepted it, and agreed to put it in the most fitting place in the church.

BERLIN, we are told, in addition to its many other advantages, can now boast the possession of the best-lighted thoroughfare in Europe—the famous Unter den Linden. The Berliner now hardly knows whether he is under the limes or under the limelight. A long time the Globe fears, must elapse before London will be able to put forward anything like the same claim. Up to a certain time at night the streets are fairly well illuminated, owing to the flaring gas-jets of the tradesmen, and the intermittent brilliance of the electric advertisements of the soap and beef-juice mongers. But when business is done for the day, when the shops are closed, and London has to depend for its light upon the exertion of the public authorities, the streets present a dismal spectacle. Humble gas-lights, 100yd apart, or highly-placed arc-lights at still longer

intervals, shed a feeble radiance not much more than sufficient to make darkness visible.

A FEW years ago Mr. William Morris, writing in the Nineteenth Century, called London "the shabbiest, ugliest, and most ridiculous capital in the world;" and, according to a later utterance of another writer, our metropolis is said to be "frankly, simply, and ostentatiously hideous." These are strong words, which it is now difficult to justify when speaking of London as a whole (remarks a writer in the Leisure Hour). Years ago there would have been a far larger measure of truth in the assertion than there is in our day. The "Great Wen," as Cobbett called it, has still many portions—notably some of the roads leading to the suburbs—unrelieved by a line of architectural beauty, and monotonously dull. In too many cases also fine positions and fine buildings have been marred by colossal deformities like the railway sheds at Cannon Street and Charing Cross. Many so-called improvements have failed to improve our streets, and there is an air of vulgarity in some places due to flaunting advertisements that is eminently offensive. Another defect that belongs to recent days is the custom of raising buildings to a height which excludes the sun, a blunder in a chilly climate like ours, though our tallest structures are low as compared with the thirty stories of New York. Then, too, we have smothered many of our fine buildings by erecting shops or warehouses or houses round them, so that architectural work of a high order has often to be hunted for in odd corners. A writer who lately published a scheme of London improvements complains, too, that the metropolis probably contains "the most irregular, inconvenient, and immethodical collection of houses in the world." All these deficiencies or peculiarities may be admitted, and yet, so far from calling London the ugliest of capitals, we believe with Mr. Hare that in Europe at least it is one of the most picturesque, "more so than Paris or Vienna; incomparably more so than St. Petersburg, Berlin, Dresden, Munich, Brussels, or Madrid." Everybody interested in the subject knows that mistakes have been made by too eager reformers which are now irreparable, but when we compare the London Architecture of forty years ago with what is to be seen to-day, we may well be proud of the progress effected. There is surely an infinite beauty in this mighty City for those who have an eye to see it, and sometimes wonderful glory of colour, as well as poetry of mist and shadow. Nathaniel Hawthorne, although an American, was not slow to discover it. London, he said, had been the dream city of his youth, and he had found it better than his dream.

WE remarked in a recent article (says Engineering) that a serious—almost a disastrous—drawback will attend the Paris International Exhibition of 1900. This is the lack of covered spaces, which will be little, if any, more extensive than those of 1889. It is the misfortune, but by no means the fault, of the Administration, which has done all in its power to increase the space available by including a large part of the Champs Elysées and all of the quay space within the Exhibition boundaries. The reluctant cession of the Champs Elysées, or, rather, a part of it, by the Municipality of Paris, was accompanied by severe restrictions, especially relating to the preservation of the trees; so that, after the great show has disappeared, the beautiful gardens of Paris shall be restored not much the worse. This municipal precaution was certainly worthy of all praise, and the Exhibition authorities have made the most of the restricted area at their disposal. That many beautiful pavilions will be built in the Champs Elysées may be assumed, while the river fronts on each side will be crowded, largely with restaurants and recreative shows. The Champs Elysées will be permanently enriched by the beautiful art palaces now being reared to replace the ugly but long-respected Palais de l'Industrie; and Paris itself will be benefited by the new monumental bridge over the Seine. The matter, however, of chief interest between now and 1900 is as to where the vast number of appli-

cants to exhibit can be accommodated. Broadly speaking, the reply is that a considerable proportion will not be able to exhibit, while the remainder must be contented to participate under restricted conditions.

SOME interesting discoveries have been made at Castle Hill, Huddersfield, where workmen in the employ of Messrs. B. Graham and Sons, contractors, Folly Hall, are excavating for the foundations of a Jubilee tower. The site chosen is at the western corner of the hill, at the highest point, 900ft. above sea level. A space 32ft. square has been excavated to a depth varying from 11ft. 3in. on the northern corner to the level at the southern corner, as the contour of the surface is irregular. At a depth of about 5ft. the labourers came upon rough stones, placed close together, diagonally and edgewise, without mortar, very much in the way in which stones are placed at the present time for the foundation of new roads in this district. About 2ft. below was another course of stones similarly placed. These stones, which extended all over the site, and beyond, are not of the character of the stone of which the hill is composed below the surface, but like that of the old worked-out quarry at the top of Almondbury Bank. In places there were evidences of stones having been burnt. Near the northern corner of the site, at a depth of 11ft. 3in., the workmen came upon the top of the ragstone rock of which the hill is formed, and in it discovered the opening of a shaft, 5ft. 6in. square, hewn into the rock. There was no covering to the shaft, but it had evidently been filled up with earth and stones. The shaft was excavated until a depth of 19ft. through the rock, from the face, or over 30ft. from the surface of the ground, had been reached. During the excavations the workmen found a quantity of skulls, jaws, and other bones of animals. The workmen also found blocks of coarse sandstone of a character unlike any stone found in the neighbourhood, but similar to some in the quarries at Linthwaite, and also like stone existing at Ackworth, near Pontefract. Several of these blocks of stone bore the marks of the chisel as plainly as if they had only recently been worked. It is conjectured that the shaft is that of an ancient well; but nothing has been found to indicate at what period it was made. In the deed granting the site the earthworks of Castle Hill are stated to be of Saxon construction. It is also believed that in the reign of King Stephen a castle stood on the hill; and there is a theory, which sprang up when some remains were found during the construction of Somerset Road, that there was a subterranean communication between the ancient castle and the River Colne. To go further back than either of these two periods, it is also believed by many that the hill was a Roman fortified place. No ancient coins, implements, or pottery or other vessels have been found. The discovery of the existence of the shaft will necessitate a change of site for the tower farther from the edge of the hill.

THE Nottingham Guildhall has just been embellished by the addition of a bronze tablet, prepared in commemoration of the town's elevation to the rank of a city. The tablet has been manufactured by Mr. C. H. Mabey, Vauxhall Bridge Road, London, from a design executed by Mr. A. Marshall, of Nottingham. The design is in thorough harmony with the building. The old town arms are prominently displayed, and on either side are representations of two cherubs holding laurels, the interpretation being the crowning of the city with honour, whilst almost in the centre a figure head is embodied, indicative of progress. The tablet, which has taken nearly nine months to complete, weighs about 5cwts.

THE old Westgate at Winchester, a time-honoured and historic structure, is undergoing some internal improvements. The city surveyor (Mr. Gamon) is overhauling the place under the eye of a sub-committee of the Corporation, and already some interesting architectural features have been uncovered, inclusive of the ancient arrow slits in the western wall commanding the approach to the gate. There

are many names of possible prisoners cut on the stonework; one is dated 1655. The ivy is to be controlled rather than be destroyed, and in due course it is hoped that the old gate may emerge a credit to the city.

ALL SAINTS CHURCH, Bryer, in the Scilly Isles, has undergone a complete restoration. The church, situated close to the beach, succeeded in 1821 a diminutive and unique structure, erected about 1741. In 1860 the present edifice was renovated by the late Mr. Augustus Smith, and a tower and porch were added. The east end has now been entirely rebuilt, while the exterior of the building has been carefully pointed. The new east window consists of two lights of an emblematic and decorative character. All the old and rather unsightly windows have been replaced by windows of a more appropriate and architectural style, and filled with stained glass of subdued tints. The walls are stuccoed, and stained a light slate colour, quite in keeping with the general appearance of the internal fittings of the church. The roofing is of red pine. All the seats are of pitch pine. The pulpit, standing on a granite base, is also of pitch pine, and harmonises with the choir stalls and chancel rail. The nave and choir are paved with black and red tiles, to which a neat finish is supplied by a border of red and cream-coloured tiles. The sanctuary is laid with tessellated tiles, the colours buff and red alternating.

THE removal of the old watch-box from No. 19, Fleet Street, now in course of demolition, reminds us that it was the last of its race here in London. Though many offers have been made to purchase the relic, they have all been declined. In this connection we are given to understand that there are still extant in London three erections formerly known as watch-houses. One is in Marylebone Lane, another adjoining Christ Church, Blackfriars Road, and yet another at the east-end of St. Sepulchre's, Holborn. The last was built in 1791.

SANDHOLE HOUSE, in the Tyne valley, which is strikingly conspicuous by its many chimney stacks and gables, is undergoing extensive alterations and repairs. Apart from its many and varied associations, and the quaintness of its Architecture, which appertains largely to the Elizabethan period, its sylvan environments give it a beautiful rusticity, whilst the view from its front, which overlooks an extensive stretch of the Tyne valley lying between Hexham and Corbridge, forms another of its attractive features. It has been unoccupied for the last five or six years, and the work of putting it in order for the new tenant has been entrusted to Mr. E. Darlington, of Hexham, the architects being Messrs. Jos. Potts and Sons, of Sunderland. The theatre or ballroom which comprised one wing of the building has been entirely demolished, as has also the brewhouse or brewery which formed another wing of the building. New fireplaces have been inserted in all the rooms—some forty or fifty in number—all the floors on the ground floor have been relaid, and sundry other alterations and improvements are being carried out. The lawns, terraces, and fancy flower pots, which, by the way, were at one time noted for their unrivalled beauty, are likewise being well attended to, and will soon be giving a good idea of their former splendour.

SOME carved oak work has been recently erected in the chancel of Clonfert Cathedral—to which we referred last week—consisting of clergy and choir stalls and bishop's throne. The clergy stalls are for the canons of the cathedral. In addition, there are seats for the dean and archdeacon. The crispness of the foliage is specially noticeable in the poppy heads and bench ends. The bishop's throne is a handsome piece of work. The emblems of the four Evangelists are carved on panels at the back. The central panel has a carved figure representing St. Brendan, the founder of the cathedral. This figure is from the Breac Moedog, and represents the saint with a flowering sceptre in one hand, and a pastoral

staff, terminating in a cross, in the other. He is standing on a rock, which rises out of the sea, and is supported at his feet by two monster fishes—the whale being associated with a legend of the saint. The emblems of the four Evangelists are taken from Soiscel Molaise. The throne is surmounted by a carved and traceried canopy, on the front of which is placed the coat of arms of the diocese of Clonfert. The whole of this carved oak work was made by Messrs. Sharp and Emery, of 17, Great Brunswick Street, Dublin, in accordance with the designs of Mr. J. F. Fuller, F.S.A., the architect. The restoration of the chancel of the cathedral is almost finished.

It is probable that the remains of another well-known coaching inn will soon be swept away if the old houses almost opposite Aldgate Pump, now up for sale, find a purchaser. The restaurant, with its many-windowed front, and the house next door once formed the front of the Saracen's Head Inn, from which the coaches for Norwich started. An archway in the centre of the building leads to the yard, which was at one time alive with the bustle and activity of coach life. The galleries have, however, disappeared, and the place has been very much modernised; but, in spite of this, the view of the inn is not altogether unpicturesque, and it will be a matter of regret when London has lost another of its quaint hosteleries.

ONE of the most historic taverns in London has been closed, and lies in ruins under the destroying hand of the moderniser—the very old Magpie and Stump in Fetter Lane. Its associations with political and literary movements of the past fill a large chapter. The whole region round about Fleet Street is fast undergoing change—ancient inns and coffee-houses where revolutionists plotted or great thinkers scribbled, are one by one vanishing to give place to the up-to-date hotel of bizarre decoration and garish illumination.

THE most remarkable Art sale held for many years past has just been concluded at Christie's, when the renowned collection of works of Art of the sixteenth, seventeenth, and eighteenth centuries formed by the late Martin Heckscher, of Berlin, was dispersed. The total of the three days' sale of only 324 lots brought the enormous sum of £64,705 10s. In point of quality the collection has never been surpassed, inasmuch as practically every lot was of absolute and undeniable genuineness, and dealers and collectors from all parts of Europe throughout competed with unusual ardour as each article was offered for sale.

THE collection of oil and water-colour paintings with which the picture galleries of the Crystal Palace have this year been refurnished is well up to, and in many ways excels, the standard attained in previous years. In all, nearly 850 pictures are hung, and this large collection is contributed to by many eminent English and foreign artists. Mr. E. Crofts, R.A., Mr. J. MacWhirter, R.A., and Mr. E. M. Wimperis, R.I., acted as judges in awarding the premiums. In the classes open to the works of English artists, the gold medal for an historical or figure subject in oils was awarded to Mr. T. Blake Wirgman for his picture "Elsa and the Wild Swans," an interesting work illustrating a scene from Hans Andersen's Fairy Tales. Silver medals in the same class fell to Mr. Harold Speed for his picture, "Medusa's Head," Mr. G. B. Jacob Hood for his work, "A Nurse at the Children's Hospital," Mr. G. Sherwood Hunter, A.R.A., for his picture of a funeral of a fisherman's child on the Zuyder Zee; and to Mr. C. Vigor for his allegorical picture, "Innocence and Guilt." Bronze medals in this class were awarded to works exhibited by Mr. H. A. Bone, Mr. H. A. Olivier, and Mrs. M. Murray Cookesley. In the class for landscapes, sea pieces, animals, and other subjects, the gold medal fell to Mr. Yeend King, R.I., for his "Sleeping Waters;" and silver medals were awarded to Mr. Louis B. Hurt for "Sunshine and Shower," Mr. J. C. Adams for "The Morning Sun," Miss

Fannie Moodie for "The Tempter," and to Mr. C. H. Poingdestre for an Italian scene. Bronze medals in this class were given to Mr. D. Longsdon, Mr. C. Stuart, and Mr. F. Whitehead. The gold medal for the best water-colour drawing, irrespective of subject, was awarded to Sir Wyke Bayliss, P.R.B.A., for his scene of the interior of Amiens Cathedral. Silver medals in this class were awarded Mr. H. R. Seer, Mr. R. Meyerheim, Mr. F. Walton, and Mr. A. Kinsley; and bronze medals to Mr. J. Muirhead, Mr. E. E. Briggs, and Mr. N. Brown. Several awards were also made in the classes confined to foreign artists.

THE Edinburgh Architectural Society's prize scheme for this year embraces four competitions, all of which are open to the members of the Society generally, without any restrictions as to age. The first contest terminates on June 1st, by which date competitors must send in their work in connection with the hon. President's prize of £10. The design required is of a drinking fountain. In the same section designs for an organ-case must be submitted by September 28th; and for a cottage hospital for a small country town by October 19th. For Mr. J. A. Morris's award of £5 for the best summer's work, drawings must be handed in by October 5th; for the President's prize of £3 3s. for a design of an English seventeenth century facade of a nobleman's country seat, by November 30th; and for the hon. President's prize of £2 2s. for a design of an entrance gate, by December 14th.

THE British Fire Prevention Committee are actively pursuing their efforts in the direction of guarding against conflagrations by the adoption of precautionary measures, such as the publication of pamphlets, the discussion of practical questions at meetings, and by scientific research. The provisional rules and list of members of the Committee have just been issued. The latter is very large and includes the names of many eminent architects, as well as those of influential personages of other professions interested in the work of the Committee, which is good evidence of the popularity of the movement. The latest pamphlet published under the auspices of the Committee is entitled "Cotton Fires and Cotton Bales," and is written by Mr. R. H. Scotter, C.C. It deals specially with the construction of warehouses for the storage of cotton bales. Mr. Edwin O. Sachs writes an editorial note to the book.

MR. YEEND KING has found purchasers for both his big pictures now on view at the Academy. One goes to Liverpool, but "Milk-Time" has been acquired for the nation by the Chantrey Bequest Trustees. Mr. King is a Londoner by birth, where he studied under Bonnet and Cormon. As a landscapist he made his mark at the R.A. in 1879, with "Green and Gold," a work which found an immediate purchaser. There are very few galleries in London in which Mr. King does not exhibit, and for some time he was one of the leading lights at the Society of British Artists. Another work which has been bought by the Chantrey is Mr. Melton Fisher's picture, "In the Realm of Fancy," which hangs in the Second Gallery at Burlington House. Mr. Fisher was a student at the Lambert School of Art at one time, and he studied for a while under Mr. Sparks. From London he went to Paris, and there he worked under M. Bonaffé. On his return to England he entered the Academy Schools and succeeded in winning a travelling scholarship. This took him to Italy, and the charm of the country so got hold of him that he established himself in Venice. For some years Mr. Fisher has enjoyed a wide popularity as a portrait painter, but his work in this direction is mainly carried on during the London season.

At the last meeting of the Portsmouth Archaeological Institute, Mr. Talfourd Ely read a paper on the antiquities of Hayling Island. In 1045 the manor was granted to the church and monks of Winchester; but William the Conqueror gave the greater part of Hayling to

the Abbey of Jumieges. In the reign of Henry III. a priory was built, but on the suppression of alien priories by Henry V. it was bestowed on his new foundation of Carthusians at Shene. Henry VIII. granted the priory to the college of Arundel. Before the building of the priory there was a church in Hayling, but it was swallowed up by the sea in Edwardian days. The older font in South Hayling church may have belonged to this earlier edifice. The latter church dates from the thirteenth century, and contains many curious features. North Hayling Church is perhaps more ancient. Near it is the oldest house in the island. The manor house dates only from 1777, but stands on the site of an older building, to which belonged the moat, the square well, and the manorial dovecote. Close by is the old tithe barn, 140ft. long by 40ft. broad, said to be "capable of holding upwards of 150 loads of sheaf wheat." Its stone basement is said to date from the fourteenth century. In 1293 we hear of the prior holding a "water-mill worth by the year sixty shillings." This was no doubt represented by the tidal-mill, some of the charred timbers of which are still standing. Tournier Bury is an almost circular space surrounded by an earthen rampart and fosse, and is of British origin. In "the Towncil Field," not far from North Hayling Church, are the foundations of a large building, near which much pottery has been found, and also coins ranging from the middle brass of Augustus to a British imitation of a coin of Postumus. During an experimental excavation of this site Mr. Ely discovered, in a trench 21ft. long, over fifty tesserae, which had obviously formed part of a mosaic pavement. This established the Roman origin of the remains. The paper was illustrated by the above-mentioned coins, several sketches, photographs, and specimens of pottery from the site in question.

Most visitors to Antwerp will be familiar with the famous Kums collection of pictures, which, since 1891, has been open to the public in the four large salons of the Hôtel Kums. It must certainly be ranked as one of the most noteworthy private collections in the Netherlands, and its dispersal this week is naturally attracting a good deal of attention. M. Kums, who was a wealthy manufacturer of sail-cloth, was assisted by the advice of the famous artist, Henry Leys, to whose discrimination is no doubt due the high average artistic merit of the collection. With hardly an exception, M. Kums confined himself to the work of artists of wide repute. Of pictures by his own countrymen he acquired a small canvas by Dyckman, three examples of Gallait, one Joseph Stevens, and a portrait of himself by Alfred Stevens. One of the finest sections is the French. Fromentin is here represented by "Le Pays de la Soif," Jules Dupré by "Crépuscule," Corot by "Le Matin," Diaz by three pictures, including "Les Gorges d'Apremont," Th. Rousseau by "Le Pont," Meissonier by "Le Fumeur Blanc," and Millet by "La Porteuse d'Eau." There are also examples of Troyon, Decamps, Delacroix, Courtrier, and Géricault; as well as of Dutch and Flemish masters, including Rembrandt's portrait of himself in Eastern costume, and works by Franz Hals, De Keyser, Van Dyck, Rubens, Terberg, Hobbema, S. and J. Van Ruysdael, Wouverman, A. and J. Van Ostade, and Paul Potter. A portrait of Marguerite Thérèse is attributed to Velasquez; and a picture that is sure to attract buyers is Watteau's "Le Glorieux."

THE picture of next year is already determined. Mr. Orchardson, R.A., is to paint, in one group, four generations of the Royal Family—the Queen, the Prince of Wales, the Duke of York, and Prince Edward of York. The whole group has been composed and blocked in, and much progress has been made with the figures of the Prince of Wales and the Duke of York, who have already visited Mr. Orchardson's studio and given him sittings. The commission comes to the painter from the Royal Agricultural Society, of which the Prince of Wales is president.

THE LIBRARIES OF THE MIDDLE AGES.*

By T. G. JACKSON, R.A.

HAVING pointed out that public libraries were one of the popular movements of the present day, the lecturer, in a preliminary allusion to the libraries of the early Middle Ages, when books were so rare and precious that the greatest care was necessary in their storage, said that the only large collections must have been those in the cloisters of the religious houses or collegiate churches. The earliest went back to the time of St. Benedict, in the sixth century; though there was one at Jerusalem in the third century, and the church at Hippo inherited the books of St. Augustine, in the days when the great Roman libraries were still in existence. It was on the model of the old classical libraries at those of the churches and convents were formed. Of the

TWO KINDS OF PRIVATE LIBRARIES

Among the Romans—the simple and the luxurious, which were both described—the simpler plan was adopted by the churches and convents as more fitly serving their needs, the books, for the most part, being kept in chests locked up in presses. As the collections increased, the books were divided into two classes: one being kept as a reference library, and placed in presses in the cloister, where students could come and consult them, and another consisting of volumes which were lent out to the monks to read. In this connection the lecturer quoted a curious rule made by Archbishop Lanfranc in 1080 for the English Benedictines. As collections increased, accommodation had to be found for them.

AT CHRIST CHURCH, CANTERBURY,

in the fourteenth century, the books, which had increased to 698, were dispersed in cases throughout the convent wherever space could be found. The inconvenience of this to students requiring to refer from volume to volume led to the provision of a room devoted to books, and with conveniences for studying them. Between 1414 and 1443 a library was built over the Prior's Chapel at Canterbury, and another at Durham over the old sacristy; in the Abbeys of Cîteaux and Clairvaux similar provision was made over the scriptorium between 1480 and 1503; at Saint-Victor, at Paris, between 1501 and 1508; and at Saint-Germain-des-Prés, about 1513, over the south transept. Buildings specially to hold their libraries were first erected by the universities and colleges. The oldest structure of the kind in England, perhaps in Europe, is the

OLD LIBRARY OF THE UNIVERSITY OF OXFORD,

which still retains many features of its original form. This structure, rarely seen by visitors, and even unknown to the majority of Oxford men, is a two-storeyed building situate on the north side of the choir of St. Mary's Church, joining the tower at one end, and separated from the body of the church by a narrow courtyard. Having glanced at the way books were kept, used, and lent at Oxford prior to the erection of this building, the lecturer gave a sketch of its foundation by Cobham, Bishop of Worcester, about 1320, and some incidents in its early history, following with a description of the interior, furniture, and general arrangements. Long benches were placed at regular intervals at right angles to the walls on which the volumes lay on their sides. A bench was fixed in front for the reader, and a window came between each pair of desks to light that pew cell. Every volume had a metal clip riveted to the front edge of the board forming one corner, to which was attached a light iron chain of the requisite length, having at the other end a ring. This ring ran upon an iron rod which was carried along the top of the desk, and was secured at the end by a hasp and lock to prevent the ring being drawn off.

The foundation of Bishop Cobham's library was succeeded shortly afterwards by that of

THE LIBRARY OF DURHAM COLLEGE,

Oxford, by Richard de Bury, Bishop of Durham (1335-45), of whom an interesting sketch was given by the lecturer, supplemented by some humorous passages quoted from the bishop's "Philobiblon." The books bequeathed by De Bury to the college were kept for many years in chests under the custody of scholars deputed for the purpose. At the beginning of the fifteenth century a library was built, and regularly furnished with book-cases or settles inclosing pews or studies between them, where the books were chained. When Durham College came to an end at the Dissolution, its old buildings were utilised by its successor, the present Trinity, and the old Library of Durham College still serves as the library of Trinity College. William of Wykeham's New College at Oxford set the fashion for all future collegiate buildings at either University in provision being made for every department, and thenceforward

EVERY COLLEGE HAD ITS LIBRARY

as an essential part of its plan. Though books were few, the rooms devoted to them had to be very large, the chaining of the books to the desks making it possible to have only very few on each desk. Soon, as books increased, shelves were formed behind the desks, tier by tier, until at last in the seventeenth or eighteenth century they reached the ceiling. The appearance of the fittings before that time can be well seen in the old Library of Merton College. Of chained libraries there are at least three extant in England, that belonging to Hereford Cathedral being the most ancient and perfect. Old chains, hasps, and staples belonging to Hereford—specimens of the actual fittings of a mediæval chained library—were exhibited by Mr. Jackson, and the method of fixation explained. All Saints' Church, Hereford, and Wimborne Minster also possessed chained libraries. But the finest in the world is that of

SAN LORENZO, FLORENCE,

the great hall of which was designed by Michel Angelo in 1524, to contain the collection formed by several generations of the Medici. The lecturer then touched on the difficulties of consulting books in the old chained libraries. Shelves for the ever-increasing number of books had been provided, but desk accommodation remained as before. One student occupied on a volume prevented three or four others getting access to the books. This led to the library rooms being enlarged. Reference was made by the lecturer to Duke Humphrey's connection with Oxford, and to his splendid benefaction of over 600 books to its library in the earlier half of the fifteenth century. The new acquisitions made more commodious quarters imperative, and in 1444 the University resolved to build an upper story to

THE NEW DIVINITY SCHOOL,

which, begun in 1426, was being slowly carried towards completion. The change was at length made in 1480, when the University Library was removed from the old solar or upper chamber at St. Mary's to the new solar over the Divinity School. The lecturer then glanced at the subsequent fortunes of the Library, which was despoiled of the most valued of its treasures by the Commissioners of Edward VI., and munificently enriched, altered, and enlarged by its second founder, Sir Thomas Bodley, at the end of the sixteenth century, since whose day the venerable central room has remained practically unaltered, the most attractive spot to the student to be found anywhere. Chains were bought for the Bodleian Library as late as 1751; it was not till 1757 that this method of securing the books was abolished. Other libraries described more or less fully were that of St. John's College, Cambridge;

THE NEW LIBRARY FINISHED BY

SIR CHRISTOPHER WREN

in 1695, which forms the western side of Nevill's Court at Trinity College, Cambridge—a stately building, both within and without, a triumph of Architecture, which would suffice

by itself to establish Wren's reputation as an artist; and the fine building of the Radcliffe Library, completed by James Gibbs in 1747.—Interior and exterior views and details of the various buildings described were shown by the lantern, including a view of a library of the lecturer's own making, in which he had tried to combine the two arrangements of cases against the walls and cases breaking out from them.—Mr. Willis Clarke, opening the discussion, expressed the opinion that modern libraries were direct offshoots of the libraries of the Benedictine period, and pointed out that the monks then could not foresee the number of volumes their votaries would collect, consequently libraries were not formed as part of the original Benedictine plan, and when the number of books became too large they had to be put in another place—for instance, at Durham over the sacristy, generally at the end of the south transept of the church, and at Canterbury over the Prior's Chapel.

THE MONASTIC LIBRARIES

were distinctly prototypes of the lending libraries of modern times. They would find the monks took great care of their manuscripts; in fact, the writings generally ended with some injunction to take care of them, or a curse would be pronounced. The speaker recommended a study of the libraries at Oxford and Cambridge Universities, where, he said, they could find out with tolerable exactness how the monastic book-cases were founded. With reference to the way in which modern book-cases had evolved from the ancient ones, it was the genius of Wren which first introduced them in England. He had discovered that the first library founded by Wren of book-cases against the wall was that at Lincoln, and he was inclined to think he copied it from that of Mazarine at Paris, where they knew he studied a great deal.—Mr. H. W. Brewer observed that he had found from a will made by the celebrated John Carpenter, the founder of the City of London School, that he appeared to have had an extremely good library, and he bequeathed a good number of books to the

LIBRARY FOUNDED BY RICHARD WHITTINGTON

at the Guildhall, and he stipulated that the books should be chained. The reason he gave for them to be chained to the desks was that they should be open to poor scholars of the City of London who cared to consult them. The library seemed to have been a very interesting collection of books, one of which was especially interesting to the Institute, as it dealt with Architecture, and a book on that subject in the fifteenth century must have been a great curiosity. It was by William Clee, who was Master of Works to Henry V. and Henry VI., and he added buildings to the Royal palace at Westminster, and, if he mistook not, built a fine hall at Eltham, and also executed work in connection with the Tower of London. There was a very curious letter in the book, addressed to the Privy Council of Henry VI., in which he stipulated that a sum of £1000 should be set aside for the works he was carrying out at Eltham, and in which he said he "wished this sum to be set on one side for him because for building a kitchen at the Tower of London he had not so much as forty pence."—Mr. H. H. Statham proposed a vote of thanks to the lecturer, remarking that Mr. Jackson had traced the

HISTORY AND DEVELOPMENT OF LIBRARIES

in their practical arrangement.—Professor Baldwin Brown seconded.—Mr. E. W. Hudson said one library had not been mentioned in which they must feel interested, and that was the library founded in Paris by St. Louis, King of France. He believed he got the idea from the East.—Mr. St. John Hope said if only architects and architectural students would keep their eyes open when they visited monastic ruins they would find a number of traces of libraries. For instance, in the cloisters at places like Worcester, Kirkstall, and Furness, and elsewhere, there were places, generally in the east wall, which unquestionably had a bearing upon the keeping of books.—Mr. Jackson briefly replied to the discussion.

*Sum of a Paper read before the Royal Institute of British Architects on Monday night.

ELECTRIC LIGHTING AS APPLIED TO ARCHITECTURE.*

By T. Ekin.

IN addressing the members of the Architectural Association on the subject of "Electric Lighting as Applied to Architecture," an explanation is, I think, due as to why I, an engineer, should venture to speak to you on a subject which professionally you are generally and rightly supposed to know far more about than engineers do. When your President-elect, Mr. George Fellowes Prynne, suggested my reading a paper before you on the above subject, I demurred on the grounds that, so far as the artistic and decorative portion of the subject was concerned, I was rather in the position of one seeking for information than one who was able to impart it; but he was good enough to assure me that the subject was of such importance to architects, and could be examined and discussed from so many points of view, that I assented, on the understanding I might be allowed to treat the matter from an engineering point of view, and in the manner I thought most likely to impart information and provide points for discussion. Now I assume that in this year of grace it is unnecessary for me to take up your time by dwelling upon the manifold and very apparent advantage of electric lighting over every other known form of illuminant, whether it be considered from an

HYGIENIC, ARTISTIC, DECORATIVE,

or even commercial point of view, and it is generally admitted that there are very few individuals—excepting, of course, those interested in gas or oil companies—who will not honestly endorse the above statement. At the commencement of this paper, then, it will be as well to state that I do not propose to touch upon or refer to the subject of electric lighting outside buildings, that is, upon the generating plant or other sources from whence electric energy is brought into the building or group of buildings, but rather to confine my remarks to internal lighting and the manner in which the current should be conveyed to the various points of light. Dealing firstly with the distribution of lights, it is obvious that the lighting of different classes of buildings requires distinctive treatment, because the lighting of a cathedral cannot be compared with that of a railway station, any more than the lighting of a ball-room or drawing-room can be compared with that of bedroom or kitchen. Each room or space which it is intended to light should be considered and examined from at least three different points of view, namely:

- (1) The purpose for which it is to be used.
- (2) The decorations, furniture, and general surroundings, and
- (3) The cost of the proposed lighting.

Which of these three points is the most important is probably a matter of opinion, but it may safely be assumed that the third point, or question of cost, is not the least important, because it may be taken as granted that the skill of the architect or engineer in arranging a system of lighting is in no case more marked or apparent than in getting the maximum lighting effect at minimum cost, this minimum cost including not only the first cost of putting in the work, but the more important one of annual expenditure and renewals. When considering the question of

LIGHTING NEW BUILDINGS

by electricity, the subject can be treated and dealt with with a far freer hand, and, generally speaking, with far greater effect than in the case of houses at present lighted by gas or other form of illuminant, because one is so very apt to take the positions at present held or assigned to gas as those most suitable for electric lamps, quite forgetting the fact that gas is so non-adaptable, and lends itself with such ill grace to artistic effect, that there are only certain positions in

any room in which it can safely be placed. Now I shall assume, as an axiom, that the most perfect form of lighting is that evolved from a hidden system of lamps, in other words, where no portion of the lamps themselves are brought in direct contact with the retina of the eye. It is, however, only right to point out that this form of lighting, like many other nice things in this world, is, generally speaking, the most expensive, because, as a rule, it means the placing of the lamp or lamps under some form of shade, whereby a large portion of the illuminating power is lost, and, therefore, in order to get the same effect or amount of light from hidden lamps as from ordinary unshaded, or only partly shaded lamps, double or even treble the amount of energy has to be used. In public halls, concert rooms, churches, &c., the points of light can, if taken from the ceiling or roof, be raised sufficiently far above the heads of the audience that, unless they wantonly gaze at the lamps, no inconvenience to the eyes need necessarily be felt, but it is different in the case of ordinary rooms, be they drawing-rooms, boudoirs, or dining-rooms; and it is these classes of rooms which, in my opinion, require the most careful thought as to the disposition and arranging of the lamps. In dealing with this matter, it is, perhaps, unnecessary to say that I am dealing solely and wholly with the incandescent electric lamp, and that I do not propose to touch upon the question of

ARC LIGHTING,

because, though this light is pre-eminently suited for streets, railway stations, and other similar places, it is not, and, I believe, never will be, suitable in any way for the internal lighting of buildings. Many of you must, at some time or other, have been struck with what is generally termed the "glare" of the electric light, and may possibly have thought that this was one of the inherent faults of the system. I need hardly say it is nothing of the sort, and the fault lies, not in the system, but in the brain of the stupid person who put it there. No sane man or woman, with any regard to their eyes, wilfully stares at the noonday sun; but I submit it is just as idiotic to put up a clear electric lamp and gaze at it as it is to gaze at the sun. Electricity, like most other things, to be properly appreciated must be suitably adapted to the end in view, which, as before stated, is

A DIFFUSION OF SOFT LIGHT,

without the lamp from which the light emanates being brought in direct contact with the eye. I am fully aware that the cost of complying with this requirement is in many cases too heavy to allow of its being adopted, but I submit there is no reason why every electric lamp should not in some form or other be shaded, even if the shading is simply the putting in of an "obscured" lamp in the place of a clear one. It is evident, or at any rate should be evident, that the lighting of each particular room or space should be separately considered, and that being so, it is impossible to lay down any hard-and-fast rules as to what is necessary in each particular case; and it requires a certain, or I may go even so far as to say a good deal, of practical experience and judgment to know the

PROPER AMOUNT OF LIGHT REQUIRED,

and also the position in which the lamps should be placed. Under these circumstances, therefore, I fear it is quite impossible for me to lay down any rules which would be of the slightest value in enabling you to properly arrange for the lighting of any building in which you are interested. There are, as you are doubtless aware, certain "rule-of-thumb" rules which are given in pocket books and similar literature. I have never found them to be of the slightest value, but, on the other hand, rather misleading. Take, for instance, a drawing-room. What use is it to anyone to know that a 16-candle power lamp will light a certain number of square feet of floor when raised a given height above it? In my opinion none, for the simple reason that it is quite impossible to take into calculation or make due allowance for the surrounding colouring of either walls or furniture. Leaving artistic effect out of the question for the moment, it is evident

nothing is easier than to drop a number of pendants from the ceiling, and if these are kept a certain distance from the floor, you can procure the maximum amount of light with the minimum number of lamps and cost. This mode of lighting is, however, not to be recommended, indeed, it is strongly to be deprecated, and when one sees a room lighted in the above manner it is at once apparent that a Goth Vandal, or other barbarian, has had the arranging of the lights. I think it will be generally conceded that the most pleasant, and at the same time, most artistic method of lighting ordinary living rooms is by means of wall brackets, standard lamps, and table lamps, the lamp in each case being shaded so as not to come in direct contact with the eye. With regard to the other rooms in a house, there is not, as a rule, much difficulty in assigning the right position for the lamps and their numbers, but at the risk of reiteration I would again impress upon you the desirability of considering the lighting of each room, or, at any rate, of each principal room separately, and from the three points of view mentioned at the beginning of this paper. Now the next portion of my paper has to deal with the manner in which the electric current is brought from the place where it enters the building to the lamps themselves, in other words, that portion of the work generally spoken of under the comprehensive term of

"WIRING."

As you are doubtless aware, this word "wiring" includes not only the supplying and laying of the various wires and cables, but also—at least as a general rule—the switch and fuse-boards and subsidiary switches, and occasionally the necessary "cutting away and making good," this latter expression being in many cases incorrect, as you, like myself, have probably found by experience that it could be more accurately described as "hacking and tearing away, and not making good." Many of you have doubtless had before you the tenders of some electric lighting contractors for the lighting or wiring of certain buildings, and perhaps have even gone so far as to draw up a common specification to which these various firms have tendered, and you have doubtless been surprised to find that the highest tender is sometimes half as much, and, in some instances, as much again as the lowest, and furthermore have been puzzled to know what should be done under the circumstances. Of course, if no specification has been issued, the reason of the

DIFFERENCE IN PRICES

is easily explicable, inasmuch as the contractors, having no common basis upon which to draw up their tenders, simply send in an estimate for the work and material they consider necessary, with the result that if the contractor is an honest man, taking proper pride in his work, and with a reputation and good name to lose, his prices must be, and always are, considerably higher than those of an individual whose commercial instincts have, unfortunately, prevailed and got the better of his moral ones. It is far otherwise, however, if the contractors have tendered to a common specification, because if there are great discrepancies in the tender, it is evident either that the individual quoting the lowest figure is willing to forego all profit, or else that the one quoting the highest figure intends to make a fortune. Neither of these hypotheses are probable, or ever likely to occur in practice, and it will generally be found that the real cause of the differences may be found in the loose and unscientific manner in which the specification has been drawn up. For a skilful and perhaps unscrupulous contractor nothing is easier than to drive a coach and four through a loosely and inaccurately drawn up specification, whilst it is evident that

EVEN AN HONEST CONTRACTOR,

being but human, will avail himself of every opportunity in interpreting an ill-drawn clause to his own advantage. Perhaps I may be considered wanting in courtesy in suggesting that you are likely to draw up a faulty specification but I can assure you nothing is further from my thoughts, and my only object in speaking

* A paper read before the Architectural Association on Friday, May 6th. Mr. W. Eckstein's paper on "Interior Lighting" was read at the same meeting.

thus plainly, is to insist upon the absolute necessity of drawing up the specification in the most careful manner and with a full knowledge of all the requirements necessary and incidental to the proper carrying out of the work. My experience has been that many points of vital importance to the work are—probably from want of technical knowledge—entirely omitted from many specifications, and others of no technical importance are treated with a fulness and amplification entirely unnecessary. What is the use of carefully specifying the density of current allowed per square inch of sectional area in the copper conductor, when the loss of pressure, or to use a more technical phrase, the fall in voltage, or electro motive force, is omitted? None whatever, because in the case of a light, or group of lights, placed at some distance away from the source of supply, or point from whence the electric energy is brought into the house, the contractor might possibly be carrying out his work strictly in accordance with the specification, and yet the lamp or lamps would look like "hot hair-pins," owing to the fact that the very essential point of loss of pressure had not been taken into account. Again, what is the use of specifying the most heavily insulated wire and omitting the final test when the work is completed? Instances like these could be given *ad libitum*, but for the purpose of argument this is unnecessary. There are still two points upon which I should like to warn you against, and these are, firstly,

THE LOW-PRICED CONTRACTOR

who looks to make his legitimate (or, as some would say, his illegitimate) profit on fittings; and, secondly, the contractor who offers to put in the work so that it will comply with the ridiculously low requirements—I refer to the test of the insulation resistances—of the fire offices. In London and other towns where there are electric supply companies, this latter danger is to a large extent rectified and guarded against by the fact that all work has to pass the more reasonable standard of the supply company, but it still remains in the cases of country houses, and houses in town where the owner or occupier generates his own electric energy.

Mr. G. H. Fellowes Prynne, proposing a vote of thanks to Mr. Ekin (whose paper was read in his absence by Mr. G. B. Carvill), observed that it was absolutely necessary for electrical engineers to be thoroughly acquainted with their work. He had had considerable experience in electric lighting, but he felt his utter inefficiency and a want of time to get sufficiently educated in the work so as to really undertake it himself. The architectural effect of electric lighting should undoubtedly be worked out by the architect, but the actual work should certainly be carried out by engineers. In this new method of lighting they had an astonishing power, altogether different from gas. Where it was possible to have hidden lights, such as behind arches, and in such ways so as not to bring the light down direct upon the surface, the effect was wonderful. In that room they had an example of the light above their heads, and it was most glaring to the eyes. Though the lamps should not be placed so to always get the

MAXIMUM AMOUNT OF LIGHT,

yet the maximum was often desirable. The lamps in that room he thought were very unsatisfactory. With reference to the suggestion for brackets and table lamps, they looked very nice in the drawing room, but he did not think they were always satisfactory. If, however, in lighting some rooms the lights were hidden in the ceiling, and at given points, they got a very satisfactory result.—Mr. E. Howley Sim seconded.—Mr. Hampden W. Pratt said he would like to see the subject of electric lighting well handled by an architect, to give them ideas and experience as to the best ways of using the light to advantage, and to wire without spoiling Architecture. He favoured the brackets and pendants as adopted in some public buildings with charming effects.—Mr. Carvill briefly replied for Mr. Ekin.

THE FALL OF A HOUSE.

ENQUIRY INTO THE WESTMINSTER CATASTROPHE.

THE coroner's enquiry into the circumstances which led to the death of the seven men killed by the collapse of the south section of the buildings known as Abbey Mansions, Orchard Street, Westminster, was commenced last week by Mr. J. Troutbeck (Westminster Coroner), assisted by Mr. John Slater, architect, as assessor.—Mr. G. I. L. Blenkinsopp, inspector of factories, represented the Home Office, and Mr. H. Ashmead, Her Majesty's Office of Works. Mr. Thomas Blashill, superintending architect of the London County Council, and Mr. Seager Berry, of the solicitors' department of the Council, watched the case on behalf of that body, and other persons interested were legally represented.—The first witness called was Mr. Charles James Chirney Pawley, the architect of the building, who said, after the plans were submitted to the district surveyor, the south block, which included the fallen part, was entirely re-planned. New plans were prepared about twelve months ago, and at that time some of the work had been done. The alteration affected the whole of the interior of the building. The new plans were submitted to the district surveyor. The work was carried on under witness's supervision. He had a free hand in the construction of the building, subject to the provisions of the Building Act. He visited the building at least four days a week. On November 17th, 1897, representatives of Her Majesty's Office of Works came upon the scene, and a day or two later they entered into an agreement to take the building on lease. When the Government took it over he placed the building under the supervision of his assistant, Mr. Simpson. The Government had nothing whatever to do with the construction. Witness visited the building on Wednesday, April 20th, the day before the accident. When on the roof of the south block he noticed several carpenters fixing skylights, and that

THERE WAS CONSIDERABLE JARRING

going on. He further noticed that about three-fourths of the roof had been concreted for about a fortnight, and was quite dry; and that the remaining fourth—the part which collapsed—had been concreted quite recently. He gave Mr. Simpson strict instructions not to have any of the "centres" on the roof struck until he himself gave orders for it to be done. He had at that time in his mind a similar accident that had occurred in the same neighbourhood owing to the "centres" being struck too soon. A pier ran up through the building supporting the girders of the six floors and the roof. That pier weighed 28 tons, and the weight it would have to carry would be about 47 tons. The floors were carried by girders. The plans provided for an iron stanchion, which was not put in. That stanchion would have carried 30 tons, and would have reduced the weight on the pier to 37 tons. On several occasions he gave instructions to Mr. Simpson, his representative, to have the stanchion put in. Mr. Reikard, the contractor, knew that it was to be put in. No date was fixed in the Government contract for completion, but they were endeavouring to complete by midsummer. He visited the building about a quarter of an hour after the accident, and found it was practically gutted. He went on the roof of the north block, and asked Simpson whether he had carried out his instructions with regard to the striking of the "centres." Simpson referred him to the roof contractor, who admitted that Simpson had instructed him not to remove the centering. Witness was satisfied that the removal of the centering was

THE INITIAL CAUSE OF THE ACCIDENT.

The concrete which fell from the roof weighed between fifteen and twenty tons. The total weight involved in the collapse was between 150 and 200 tons. He examined the fallen concrete, and found it saturated with water. He was able to distinguish Banks's fireproof

concrete, which was perfectly dry. The girders, which were of steel, were supplied to the order of Mr. Reikard by Messrs. Drewbear, Perks and Co. He could not tell what bearing the girders had on the pier, but it should have been 9in. Every girder was still in existence.

—The Coroner pointed out that, according to the plans, the ground floor girder should have measured 24ft. 6in., and that one which had been pointed out to the assessor by the foreman was only 22ft. 11in. in length. The difference would, he said, affect the bearings. —The witness said that it was no part of his duty to see that the girders had proper bearings, but if he saw anything wrong he would immediately point it out. Mr. Simpson, his representative, was responsible for the girders being according to specification. A bearing of only 4in. would, he admitted, be improper. He noticed that

MANY OF THE BRICKS HAD BEEN CRUSHED

by the weight above. The pier measured 2ft. 6in. in thickness, and ran up to a height of 80ft. A pier of that thickness should be reduced as it went up. He believed there was a rule that a pier should not be carried up more than twelve times its own thickness, which in this case would have been 80ft.—The Coroner: Then why did you provide for a pier 80ft. high, very nearly three times what you tell us is the recognised rule?—Witness: I was told that Banks's fireproof flooring would have a good deal to do with it.—The Coroner: I asked why you carried it up 80ft. instead of 30ft.?—Witness: Because I thought it would do. I was bearing in mind the fireproof floor which is so well tied. The fact of carrying it up to 80ft. would reduce its carrying powers. The witness added that he was of opinion that a mass of 150 tons falling would carry with it any building. The fact that steel joists were broken was very strong evidence of the very strong pressure that had been upon them.—Mr. George Simpson, architect and surveyor, assistant to the last witness, was next called, and stated that he saw the men putting in

THE CENTERING FOR THE CONCRETE ROOF.

It was supported by quartering secured with bolts, the whole resting on the lacing joints of the roof. He did not give directions as to the concrete to be used. The concreting of the roof was done in one continuous job, and he should say five or six days before the collapse. No clerk of the works was engaged. He did not consider that one was necessary, as he and Mr. Pawley were looking after the building. He knew that the centering had been struck, because it was lying on the adjoining roof.—Mr. William E. Reikard, 124, City Road, builder and contractor, deposed that about two years ago he entered into an agreement with the freeholder for the erection of the mansions, and he instructed Mr. Pawley to prepare plans and specifications. It was his own venture. The sub-contract for the brickwork was placed with a Mr. Thorpe. Witness had no control over that. He had a sub-contractor for the flooring, and had no control over that. The same remark applied to the roof and carpentering. Witness had control over the labourers' work. It was to his interest to see that the work was done as contracted for. He was

TO FINISH THE BUILDING AT PRIME COST.

There was no agreement as to the cost, but he took out the quantities and estimated the cost up to the roof at £20,000. He regarded his freeholder as the person responsible for any damage that might occur to life and property. He believed the concrete was to consist of four parts of coke breeze and one part of best Portland cement. It was to be turned over once in a dry state and twice while wet, but he did not know whether that was done. The way in which the concrete was mixed was very important.—Some startling evidence was given by the next witness, Richard Martin Collins, a stonemason, who was employed on the south section of the building, and who averred that many of the bricks used in the internal walls were received from a job in St. James's-street, where, he understood, they had been rejected. They were very soft. Some fell to pieces by

mere handling, and were thrown into the mortar mill. He could not swear that he saw any of the soft bricks used in the construction of the pier which supported the floor girders. The templates supplied for the pier were not used for the pier at all. That would certainly

AFFECT THE SOLIDITY OF THE BUILDING.

He fully realised the seriousness of that statement. The men used to take the first templates that came to hand. When witness protested against small templates being used instead of large ones, he was jeered at, and told to mind his own business. The principal carriage girder at the top went into a flue at both ends. He believed that a girder went right across the pier, and that only two girders went through each floor. The lacing girders were never bolted up to the carriage girders when they were fixed. The lacing girders rested on the flanges of the carriage girders. —Mr. W. J. W. Beckey, outside manager for the Banks' Fireproof Construction Syndicate Limited, said that that Company put in the fireproof flooring. He saw the men mixing the concrete for the roof, and he thought that the way in which it was being mixed was not right. He could not say positively whether any of the girders were bolted or not, but he noticed nothing to prevent him from putting in the concrete. His duty was only to look to the lacing joints. —James Andrews, a carpenter, who was employed by Mr. Reikard as general foreman of the job, said he remembered alterations being made in the plans. It was decided amongst other things to make the brick pier a little thicker than provided for in the specification. He used his own discretion as to the way in which the templates were put in. Mr. Pawley told him to put in 4in. templates. Except for joinery he

NEVER USED THE SPECIFICATIONS

after the footings, although he was aware they were intended to convey instructions. When the accident happened he found, much to his surprise, that the centering had been struck. —The Coroner: The concrete roof had been up a fortnight; why should you be surprised? —Witness: Well, that was all I could think of. I think concrete roofs are too heavy. —In reply to further questions, the witness said he heard that bricks came from another job, where they had been condemned. There were about 35,000 of them, and either Mr. Reikard or Mr. Simpson told him to do the best he could with them. Many of them were broken and soft; the whole ones were used for the internal walls, and the soft ones were put into the mortar mill. Sand was used with the mortar, but he did not know in what proportion. He had never been on a job of this magnitude before without a clerk of the works being employed. —Mr. Reikard, recalled, said the cost of

THE BRICKS WHICH WERE CONDEMNED

was £2 2s. per 1000 "alongside," which was a good price. They were condemned by Mr. Pawley, the architect, at another job. Mr. Pawley told witness that those bricks were rather soft, and ought not to be used for the bottom part of the building. The best of the bricks might have been used for the inside walls. Witness gave him to understand that most of them would be ground up for mortar. —Mr. John Drew-Bear, engineer, of Queen Victoria Street, said his firm supplied some of the girders for the building. In the plan no provision was made for stanchions. —Mr. Samuel Murrell, engineer, Victoria Street, S.W., said he was the contractor for the cast-iron cornice, and he was asked by Mr. Simpson to connect the roof, which he had already made. After doing that he started the concreting. Witness told his foreman, the deceased man Parker, not to touch the centering, but on going to the building after the calamity he found that the centering had been struck. With regard to the alleged improper mixing of the concrete, that material would speak for itself. Assuming that the building collapsed owing to the removal of the centering the concrete would fall in pieces of 3ft. 6in. wide. He could give no reason for the joists falling. His belief was that the accident was caused by someone hoisting a weight by means of a winch and a snatch fixed

round the pier, so causing the pier to "shoot out." One man could exert seven tons on the pier with the assistance of the snatch block. It was dangerous to strike the centering at the time it was struck. —John Hammond, a labourer, who was at work on the roof at the time of the accident, said he and five other men were instructed by the deceased man Parker to strike the centering. The concrete was very hard, and to test it witness "bounced" a crowbar on it. It sounded like a drum. He was certain that the concrete did not go first. The whole thing collapsed without the slightest warning. He should say the concrete was thoroughly set and fit for striking. He could not say whether there was any hoisting going on at the time. He did not notice any vibration. He saw nothing to account for the collapse. He had known concrete to set well and the centering be fit for striking in eight days. The portion of the concrete which collapsed had been up a much longer time. —The inquiry was adjourned after the third day.

PUBLIC IMPROVEMENTS IN LEEDS.

SEVERAL of the public and private projects now in hand for the improvement and development of the centre of Leeds have just reached an interesting stage. First of all, there is the scheme for the widening of Land's Lane. One large property was lately acquired by the Corporation, and notices have now been served upon the owners of all the scheduled premises on the east side of that thoroughfare, from nearly the top of Upperhead Row to Commercial Street. Between the west side of Land's Lane and Upperhead Row private enterprise is also exceedingly busy. It seems only the other day that a scheme was inaugurated for the demolition of a lot of old and dilapidated property in that neighbourhood, and the erection of a handsome arcade. The premises have been cleared with such rapidity that the builders have been able to take possession of the site, and it is the intention of the architects, Messrs. Ambler and Bowman, to push on the work as quickly as possible, and to complete the arcade before the end of the present year. The whole of the contracts have been let. The arcade, which will be named the "Victoria," will be 224ft. long and 18ft. wide, and the design suggests French treatment of an artistic and pleasing character. There will be an entrance from Land's Lane and Upperhead Row.

THE WIDENING OF LAND'S LANE

has revived to some extent a suggestion to make a good thoroughfare from Albion Place to Briggate, and thence direct on to the new street through the Shambles, already sanctioned by the Local Government Board. This proposal, should it eventually be carried out, would not only relieve the congested traffic in Commercial Street, but would also provide an alternative route to Vicar Lane and Kirkgate Market. The public men who advocate this extension hold strongly to the opinion that it would prove very remunerative to the Corporation in the shape of increased rateable value. Another matter which at the present time is engaging the attention of some of the municipal representatives is the proposal to open out Central Road, lying between Duncan Street and Kirkgate. Not long since the owners of the Bull and Mouth Estate approached the Markets Committee, with the idea of forming a new street from Central Road, which is the property of the Corporation. The negotiations are still pending, but if they should be satisfactorily completed the public will obtain a direct road from Duncan Street to Kirkgate Market. Among other projected enterprises in Central Leeds are alterations in Lady Lane. The march of improvement is also manifesting itself elsewhere in the city. One example of this spirit is seen in East Leeds, where the Corporation are making a short thoroughfare between Brass Street and Copper Street to communicate with Wrigglesworth Street. Although comparatively small, the scheme will be beneficial from a sanitary point of view, besides proving a great convenience to the residents of the district.

LETTERKENNY CATHEDRAL.

AN IMPORTANT LAW CASE.

IN the Queen's Bench Division, Dublin, judgment has been given in the case of Ramsey, Brown, and Co. v. O'Donnell. The plaintiffs, who are timber merchants in Dublin, sued the Most Rev. Dr. O'Donnell, Lord Bishop of Raphoe, to recover £512 10s., price of timber sold for the Letterkenny Cathedral. The question was whether the timber was according to contract. The plaintiffs contended that the timber had been passed in Dublin by the defendant's agent. The defendant denied that it had been passed according to contract by his architect, Mr. William Hague, and that the inspection by Mr. Hague's brother did not satisfy the

TERMS OF THE CONTRACT.

The judge who tried the case, Mr. Justice Gibson, directed a verdict for the defendant, leaving it to the Court to decide whether or not an inspection by an agent was sufficient to satisfy the contract. —After the argument, Mr. Justice Murphy said the question was whether the defendant, the Bishop of Raphoe, was bound to pay the plaintiff £388 for timber alleged to be sold and delivered to him under a contract of April, 1897. The contract was to be found in a letter of the plaintiff to Mr. Hague, dated April 23th, 1897. The defendant desired to have for the roofing of the cathedral at Letterkenny the best Memel timber, and in order to obtain this he wished that an architect, Mr. William Hague, should, for his protection, arrange the price to be paid, and also that the timber, before he was to pay for it, should pass the inspection of Mr. Hague, and be of the very best quality. The plaintiff agreed to

SUPPLY SELECTED MEMEL TIMBER

of such quality as to pass inspection when ready at 2s. 2d. per cubic foot, free on rail of the vessel in Dublin. His Lordship, having referred to the correspondence in the case, said it was admitted that the timber sent down to Letterkenny was never inspected by William Hague, and it was also clear that William Hague, after the timber arrived at Letterkenny, refused to have any inspection. On September 8th Mr. Robert Hague, said to be a brother of William Hague, wrote to the plaintiff in his own name, and from this letter and another of September 18th there appeared to have been a tolerably close friendship between R. Hague and the plaintiff. Now, whatever benefit that friendship might have conferred mutually on the parties to it, it certainly did not appear to have resulted in any benefit to the defendant, because it appeared that the plaintiff was quite willing to place the timber on board, when inspected by R. Hague, without any authority from the defendant and W. Hague. He (Judge Murphy) was of opinion that the defendant was unfairly dealt with in the present case, whether by collusion between the plaintiff and R. Hague or by blunder he did not know. In his opinion it was part of the terms of the contract imposed on the plaintiff to supply goods that William Hague pronounced to be

FIT FOR THE PURPOSE

for which they were ordered. The plaintiff and Robert Hague, in their mutual respect one with the other, appeared to him to have deliberately made arrangements disregarding the terms of the contract introduced into it for the protection of the defendant, and if the plaintiff now succeeded in this action he would obtain such cess through the violation of his contract. And the defendant, though he would not be able to have the pleasure of feeling that the loss was occasioned by his own error, must console himself by knowing that his loss was imposed on him according to law. In his opinion the verdict that had been entered by Mr. Justice Gibson for the defendant should stand. —Mr. Justice Johnson and the Lord Chief Baron delivered judgment for the plaintiff, and the verdict was entered for him accordingly.

ARCHITECTURAL PUPILAGE.

BY JAMES HINE.

ADDRESSING the members of the Devon and Exeter Architectural Society, on his retirement from the presidential chair at the annual meeting, Mr. James Hine, Plymouth, said the Institute of British Architects had always recognised that there was no more valuable part of a student's training than the study of good examples of ancient buildings, and the sketching, and more particularly the making, of exact measured drawings of such buildings. The idea of some might be that this tended to make a man a plagiarist, but experience showed this kind of work gave him a mastery of his Art, and a degree of freedom in designing which he would not otherwise possess. In this respect what was good for the painter was good for the architect, and their distinguished Devonshire painter, Sir Joshua Reynolds, said to the Royal Academy students 130 years ago, that he whose mind had been disciplined by long converse with the great masters, and who was best acquainted with the composition of others, would be the most capable of

NEW COMBINATIONS AND ORIGINALITY.

The period of pupilage was obviously the time and opportunity for cultivating the artistic side of an architect's work, because in the actual carrying out of an architect's business he had often to face very practical duties, and the exclusion altogether of esthetic considerations. Loyal, however, to his profession of noble Art, his principal aim would ever be to represent it adequately. It was much to the honour of Mr. Crocker that at the commencement of his professional career he distinguished himself by securing an institute silver medal for his admirable set of drawings and details of Exeter Guildhall, and to their honorary secretary, Mr. Harbottle Reed, who was quite recently awarded the Grissell Gold Medal for his clever design for a wooden church. There was no work so open to criticism—not even parsons' sermons—as the work of architects, public and private, free and open, candid and pitiful, it lasted for all time, or as long as a building stood; and happy was the architect who was not very thin-skinned. No doubt when the Jacobean masons were piling on the gony of freestone and ornament over each sturdy (and now long-suffering) column of Exeter Guildhall facade, there were loud murmurs and solemn head-shakings from venerable critics who had sworn fealty to

THE PERPENDICULAR MODE OF CONSTRUCTION. Well, that delightful old building, although it had long passed to its second century, was still open to criticism! As an example, there were many things about it one would be desirous of avoiding and nervous in imitating; yet so quaint and interesting was it in outline, and so refined in its details, that every sympathetic observer loved it. Should it ever unfortunately be taken down, it was satisfactory to know that it would exist in Mr. Crocker's drawings. Altogether apart from ecclesiastical buildings, which give pre-eminent dignity to cathedral cities, there were two beautiful and picturesque towns in the West of England—Exeter, which was largely the creation of the sixteenth and seventeenth centuries, and which had still the impress of those centuries in its principal street; and Bath, which retained the beauty given it by Wood in the last century. Why was it that in the more modern towns, fashionable and fashionable, which had sprung up during the recent century, the impress of Architecture was so imperfect and unsatisfactory? Because, for the most part, they had not been the creation or work of architects. This had been

A MISFORTUNE FOR THE PROFESSION, but it had been a greater misfortune for the towns, and had been the occasion of numberless blots on the face of Nature. Occasionally; had no doubt been possible to carry out in such new towns a well-considered and effective design; but one swallow did not make a summer, and one good building did not usually make a beautiful street.

Professional Items.

ABERDEEN.—Additions are to be made to the King Street Public School. The plans prepared by Mr. J. A. Ogg Allan, and which have been sanctioned, show a new gymnasium at the eastern extremity of the school ground. It is a granite building, two stories high, fully 70ft. long by fully 30ft. wide. The building is comparatively plain in design, but relieved by various dressed bands and other simple features. From the entrance vestibule at each end entrance is obtained to the gymnasium, which occupies the whole of the ground floor—a large room, 68ft. long by 28ft. wide, and 14ft. high. On the first floor, entering by the boys' staircase, is the manual instruction room—36ft. by 28ft. It will accommodate thirty boys. On the same floor, entered by the girls' staircase, is the cookery room, 31ft. 6in. by 28ft. The total cost of the new building is estimated at £1600, or, including furnishings, £1845. Extensive alterations are to be made to the main buildings.

The plans are now completed of the school which the Aberdeen School Board is about to erect at Old Aberdeen. The building is so planned that, should necessity arise, it can be doubled in size by taking down the east wall and reduplicating the building on the east side, making it a two-class school with accommodation for 1100, instead of—as provided by the plans to be carried into effect at present—a one-class school with accommodation for 550. It will be a granite structure two stories high. The west elevation, facing Dunbar Street, shows two gable-forms projecting forward on each side of a square-topped central block. The surmounting pediment is the chief architectural feature of each of the gable-forms. The central block is treated in a series of massive pilasters, which support the entablature above the large three-light window on each floor. The north and south elevations—which are of similar design—are pierced with four-light windows on each floor, marked by tall pilasters and entablature as in the western end. The school will be built of "rustic" Rubislaw granite, all the pilasters, mouldings, and other dressed features being in close-picked Kemnay stone. The architect is Mr. J. A. Ogg Allan, the Board's Master of Works. The total cost of the work is estimated at about £5500.

ARKLEY.—The enlargement of St. Peter's Church, Arkley, is completed. The addition to the edifice consists of a chancel, south vestry, and organ space, so erected as to facilitate future extensions by means of an aisle on the north side, and a further development westward. The Architecture of the new chancel is Early English, with groined oak roof, and six clerestory windows after a well-known Northamptonshire example. The floor is of stone, with marble in the sacrum. The measurements of the chancel are: 31ft. by 17ft., and 27ft. to the ridge of the groining. The outward facings of the chancel are snapped flints, set off effectively with dressings of very fine Stamford stone. By the enlargement, space is afforded for 100 additional sittings. Mr. J. C. Traylen prepared the plans, and the contract was undertaken by Mr. W. Wade, of St. Neots.

BARRY DOCK.—The recently-opened chapel at Barry Dock is one of the largest in the town, and, together with a commodious residence for the pastor adjoining, has been erected at a cost of £2500. It has seating capacity for 750. The architect was Mr. Jenkin Williams, Cardiff, and the builder Mr. Jonathan Lewis, Cadoxton.

BIRMINGHAM.—A Baptist chapel has been erected at King's Heath. The total cost, together with the schools completed previously, was £7000. The new church is 72ft. long by 43ft. wide, has transepts and a large chancel, and will accommodate about 500 persons. The building is of Ecclesiastical character, and the materials used are Leicestershire bricks, with Hollington stone for the dressings and the

mullions of the windows. Internally the church has a lofty appearance, having an open timber roof of pitch pine, springing from stone moulded corbels, constructed with bold arched ribs, which give an air of spaciousness and lightness to the interior. The chapel is heated by hot water pipes in the most approved manner, and is ventilated on the automatic principle of "Tobin" flues in the walls, and exhaust roof ventilators. It is well lighted on all sides. At the rear is the school, erected some time ago. The work has been carried out by Messrs. James Moffat and Sons, of South Road, Camp Hill, from the designs and under the superintendence of the architect, Mr. A. Harrison, of Queen Chambers, Colmore Row.

The one-time Presbyterian Church in New John Street West has been transformed into the Established Church of St. Edward. Mr. H. T. Buckland has been entrusted with the task of converting the building architecturally. His task has been a difficult one, for the architect of the chapel seems to have had no scruple about the mixing of styles, as the Early English clerestory, the Corinthian pillars, the timbered roof, and the double arcade of Romanesque pillars prove. But the strangest feature of the building is the apsidal recess in what is now the chancel. Here it was once intended that the minister should have his pulpit; now it is a veritable apse, the semicircular vaulting being covered with conventional ornament on a gold ground, a painting of the Crucifixion overlooking the plain oak altar. To separate the chancel from the body of the church, the three pillars nearest the altar have been cased and brought more into harmony with the general architectural tone of the building. To the Gospel side of the altar is the organ case, with its delicate perforated screen facing the congregation. The wall on either side of the altar is panelled in the lower part, the upper two-thirds being stencilled with a rich diaper, in which appear in manifold repetitions the Alpha and Omega and the I. H. S., so familiar in Christian iconography. Choir stalls, a pulpit, and reading desk have been erected. At the west end of the church there is a gallery, and perhaps the one point in which the building is unorthodox is that it lacks a centre aisle.

BOLTON.—Memorial stones have been laid of the Victoria Wesleyan Hall, Bolton. The cost of the building, including the purchase of the shops in Knowsley Street, is estimated at between £20,000 and £30,000. One of the shops will be converted into an entrance hall, and a tower will be built over this to the height of 90ft. A spacious vestibule is to be provided, having an inquiry office, and to right and left broad staircases to the gallery of the hall. Beyond these, through a double archway, are the staircases to the lower floor. Past these staircases are the doorways to the main floor of the Victoria Hall, on the level of Knowsley Street. The centre part of the floor is sloped from front to back, and at the sides the seats are arranged tier above tier, so that everyone can have an uninterrupted view of the platform. The roof will be arched and panelled, with coved sides over part of the gallery. Messrs. Bradshaw and Gass, of Bolton, are the architects.

CARDIFF.—A new chapel has been erected in Machen Place, Riverside. The building is designed in the Gothic style of Architecture, and has been erected by Messrs. Cox and Bardo, contractors, of Elm Street, Roath, from designs prepared by Messrs. Habershon and Fawckner, architects. It has a total accommodation for about 700 (including the galleries, which are placed round three sides of the building). The chapel has a light and lofty appearance, and the glazing throughout is of cathedral tinted glass, the window in the principal front being a large one, with tracery. The rostrum and communion rail are placed at the far end of the building, the former having open panels fitted in with iron work. The gallery front is also of ornamental iron work, and was supplied by Messrs. J. Williams and Son, of Queen Street, who also fitted up the warming apparatus. The aisles are laid

with wood-block flooring, and the chapel is lighted by "sun burners" in the ceiling, supplied by Messrs. W. A. Baker and Co., of Newport. The entire cost of the building exceeds £4000.

CARLTON (Nottingham).—The United Methodist Free Church has erected a new chapel and schools at Carlton. Messrs. R. C. and E. R. Sutton, of Nottingham, are the architects, and Mr. John Lewin is the builder. The premises are of a comprehensive character, the Architecture being of the late Gothic style, somewhat freely treated. The facings are composed of red sand bricks, with stone dressings, and a noticeable feature is the large tracery window in Main Street.

DERBY.—The newly-consecrated church of St. Augustine is a substantial red-brick building, with seating accommodation for 420, and is designed in the architectural style of the Early Decorative period. It was originally arranged that the church should consist of a nave and two aisles. Up to the present, however, all that has been done is the erection of the nave and north aisle. The other aisle and the completion of the church according to the plans adopted will be carried out as circumstances permit. Messrs. Naylor and Sale are the architects, and Mr. Tomlinson, of Norman-ton Road, the builder.

DODBROOKE.—A new screen has been erected, and the organ reopened, after extensive additions, in the Church of St. Thomas of Canterbury. The new carved oak screen is across the north aisle, and completes the series of front screens dividing the nave and aisles from chancel and chapels. The new organ case and front is in vainscot oak, with three towers of metal pipes, the central tower containing some of the large 16ft. double diapasons.

DUBLIN.—The new shrine of the Virgin Mother of Good Counsel has been opened in the Church of St. Augustine, Thomas Street. The chapel which is devoted to the shrine is situated on the east side, and opening off the chancel, with moulded arches and marble columns, and consists of two bays, 28ft. by 15ft. by 25ft. high, richly grained, and lighted with tracery windows, which are filled with stained glass, the side windows having representations of the Assumption and the Maternity. The walls of the chapel are built in Bath stone, enriched with moulded wall columns; the jambs of the windows and wall surfaces are carved in low relief, with foliage, having shields introduced at intervals, with emblems from the Litany in gold on a blue ground. The decoration of the moulded wall columns between the bands is in the French style, and on the lines of Sainte Chapelle in Paris. Mr. John Early, of Camden Street, carried out the decoration. The wall surfaces under the side windows to the height of 11ft. are inlaid in mosaic, with ornamentation appropriate to the mosaic groups in the centre panel of each bay, representing the Nativity and Holy Family respectively. The altar is of white Carrara marble, with inlays of Venetian mosaic, columns and inlays of Mexican agate, onyx, rouge, jasper, and Sienna marbles. The design is in the decorated Gothic, to correspond with the church. The reredos is divided into three bays, deeply recessed with Sienna marble columns and caps. This work, as well as the frame enclosing the picture of the Mother of Good Counsel, is executed by Messrs. M'Gloughlin and Sons, Great Brunswick Street. The total cost of the work, including the stained glass windows, is over £2400, and all has been carried out from the design and under the supervision of Mr. G. C. Ashlin, architect.

EXETER.—The Devon and Exeter Turkish Bath Company Limited has just opened new baths at Exeter. The buildings have been specially designed and erected for the baths. The electric light is used throughout. The baths comprise three hot chambers, shampooing rooms, with the latest improvements

in shower, douche, needle, etc., baths, served with hot and cold water; also a plunge bath, and a capacious cooling-room, etc. The heat in the bath rooms is maintained by a convoluted stove, and the ventilation is on the most approved principle. The air, after being filtered and purified, is heated outside the bath rooms, and a continual current forced into them, thus preventing stagnation or stratification. The whole of the work has been carried out by Exeter firms.

GRANGETOWN.—The foundation-stone of new public baths at Grangetown has been laid. The new buildings will consist of a swimming bath and slipper baths, with the bathman's and caretaker's house above, and a public washhouse and laundry. The contract for the whole of the work has been let to Messrs. Bastiman Bros., of Middlesbrough, for £1736. The architect is Mr. Mitchell Bottomley, of Middlesbrough and Leeds.

HUNCOTE (Leicester).—A new parish church is being erected for Huncote, to be called St. James's. The old chapel of St. James' many years ago fell into decay, and, "becoming ruined," the land on which it stood was merged into the estate of the adjoining landowner, and lost. The edifice has been designed by Mr. Francis Bacon, of Newbury, Berks, at an estimated cost of £2500, but only the chancel and part of the nave is now being proceeded with. The new church will be built with Huncote granite, relieved with white stone dressings, and when completed in accordance with the original designs will be a handsome little edifice, with tower and spire at the west-end. The builder is Mr. Thomas Herbert, of Leicester.

INVERURIE.—Contracts for the locomotive and other workshops to be erected by the Great North of Scotland Railway Company at Inverurie have been accepted as follows:—Mason work, Messrs. Pringle and Slessor, Aberdeen; carpenter, Mr. Buchan, Monymusk; slater, Mr. G. Davidson, jun., Thistle Street, Aberdeen; plumber, Messrs. Blaikie and Son, Aberdeen; painter, Messrs. James Garvie and Sons, Aberdeen; and steel and iron, Messrs. A. Findlay and Company, Motherwell. The contracts include the erection of a carriage and waggon shop, paint shop, smithy, and foundries, boiler-fitting and erecting shops, while on the same area, these blocks are each separated from the other by a wide open space, so as to provide against the spread of fire. The contracts just concluded form the first section of the work, and will occupy fifteen months in completion. The cost of the operations now sanctioned is understood to be about £40,000.

KENDAL.—New Roman Catholic Schools are in course of erection here to accommodate about 450 scholars. The new buildings are expected to cost £4000. They are designed by Mr. John Stalker, Kendal, in the domestic Gothic style of Architecture, and are to be built with the local stone, with Prudham free-stone dressings. The roof will be covered with Buttermere slates. The building will contain on the ground floor a mixed schoolroom, infants' schoolroom, three class-rooms, and book stores. All the rooms in the schools are being lined for a height of 4ft. with glazed bricks. The following are the contractors entrusted with the various works:—Mr. James W. Howie, mason and slater; Messrs. Nelson Brothers, carpentry and joiners' work; Mr. Lawrence Airey, plumber; Mr. William Jackson, painter and glazier; Mr. Benjamin Davis, plasterer; Mr. John Kennedy, smith, all of Kendal; Messrs. John Gill and Co., ventilating engineers, Lancaster; Messrs. Dilworth and Carr, heating engineers, Preston.

LEAMINGTON.—The foundation stone of the new wing of the Warneford Hospital, Leamington, has been laid. The new wing is part of the original design for the extension of the hospital. Messrs. Young and Hall, London, are the architects, and the wing will be built on the pavilion principle. The cost of

the contract is £6760. The new wing will accommodate thirty-two additional patients.

LEEDS.—The Leeds Workpeople's Convalescent Home at Horsforth has just been opened. The building formerly consisted of two semi-detached villas—that has been transformed into one building. It is built of stone, and its foundation is hard sandstone rock. The principal entrance is on the south side, and a commodious porch gives access to a wide entrance-hall running the full width of the house. The architect of the scheme was Mr. Walter A. Hobson; the builder, Mr. C. Winterburn; joiner, Mr. John Ingleson; plumbers, Messrs. J. E. Bedford and Son; slaters, Messrs. Wm. Atkinson and Sons; painters, Messrs. Royland and Horsman; plasterers, Messrs. Luman and Blackburn.

The Oxford Place Wesleyan Chapel, an historical edifice originally built to accommodate 2500 persons, has been undergoing extensive alterations. The chapel front is nearing completion, and the internal alterations (re-seating, new exits, electric light, &c.) will be completed by the end of September. The total cost will be about £20,000.

LEICESTER.—The newly-consecrated church of St. Michael and All Angels, Knighton Fields, has been erected at a cost of about £4500. The design is of a simple character, the materials used being principally red bricks, relieved with stone dressings. The roof is covered with old stone slates obtained from houses pulled down along the line of route of the Great Central Railway. The work has been carried out to the plans of Mr. S. B. Pick (Everard and Pick), by Mr. H. Bland.

LONDON, E.C.—New premises have recently been opened at 51 and 52, Aldermanbury. The structure was erected from designs prepared by Mr. Herbert Knight, architect, of 75, Aldermanbury. The building is in the Italian style, and constructed of stone and red brick, an interesting feature being the two striking gables to the roof. The building comprises ground and lower ground floors, with four other floors over, access to which is gained by a hydraulic lift. Electric light has been installed together with the latest sanitary arrangements. The various floors are supported on rolled steel joists and iron columns, and are specially calculated to bear heavy weights. The builders were Messrs. Pater and Co., of Portland House, Basinghall Street.

LONDON, W.—The Passmore Edwards Acton Cottage Hospital, just opened at Acton, contains two large and two small wards, an entrance hall, operating-room, kitchens, and nurses' and matron's quarters. It is Georgian in style of Architecture, of red brick and Bath stone. The cost is about £3000, and the architect is Mr. Charles Bell, of 3, Salter's Hall Court, E.C.

PERTH.—The Perth Water Commissioners have approved the plans of new buildings at the Water House. The addition consists of a new engine-house. The floor is 18ft. under the ground line, and the building rises above the ground to the height of the building to the north of the centre dome. The new portion is designed to harmonise with the present erection, and is to be built of stone. The front, or elevation, towards Tay Street will complete the original designer's ideas—the dome in the centre and the square buildings on each side. The elevation towards Marshall Place is carried out in the same manner as the elevation towards Tay Street. The plans have been prepared by Messrs. James Smart and Son, architects, New Scott Street, Perth.

PLYMOUTH.—A church and schools have been erected for the Methodist Free Church. The site was a rather awkward one, but the architect, Mr. H. J. Snell, has utilised nearly the whole of the available land, and the building, which is of the Romanesque style of Architecture, is one of the most imposing in that part of the town. The contractors were Messrs. C. H. Tozer and Son. The chapel,

which is of limestone, with Bath stone dressings, has two entrances. The cost of the buildings was nearly £5000.

ST. HELEN'S.—Large additions have been made to the St. Helen's Borough Sanatorium at Peasley Cross. The total cost of the extensions has been £6389. The new buildings, which have been erected by Messrs. Whittaker and Woods, of St. Helen's, comprise a large pavilion, an observation block of two wards, and a large increase in the administrative block.

TECONNAUGHT (County Down).—A new Roman Catholic Church has been erected at Teconnaught, in the parish of Kilmore. The style is Gothic of a late period, and the dimensions give a nave of 80ft. by 32ft. The east end is spanned by a chancel arch, and beyond this the sanctuary projects to a depth of 16ft., communicating with a sacristy 15ft. by 13ft. In addition to the choir space the gallery will provide seats for at least 100 people. The interior work is of the best quality of pitch-pine. The fine grey stone, procured from a neighbouring quarry, is relieved by tasteful dressing. Mr. J. J. McDonnell is architect, and Messrs. Fitzgerald Bros., Limited, Belfast, are the contractors.

TORQUAY.—A new Masonic Temple is being erected here, the corner stone having recently been laid. The building will be Gothic in style, and mainly of red sandstone with bath stone dressings. Messrs. Bridgman are the architects, and Mr. S. Hawkins the builder.

TUNBRIDGE WELLS.—The Forest Brick Works, Tunbridge Wells, just opened, inaugurates an undertaking which will have an important influence on the future extension of the borough. In all about twenty acres of ground have been utilised. The building made is of course the staple industry of Tunbridge Wells. Of late years the trade has been handicapped to an extent only known to those who are actively interested in it. Bricks, which are responsible for a third of the cost of building, have been wanting—wanting in the sense that their price and the difficulty of obtaining them without long delay has practically prohibited the building of houses. It is to the enterprise of Mr. W. Barnsley Hughes, architect, that the new brick works have sprung into existence. The construction of the premises was begun in August last, and it may be here noted that the bricks used were made from the clay at the works, of which there is practically an unlimited quantity. The undertaking has been planned under the expert advice of Mr. E. P. Lee, of the Cardiff brick works.

A new hotel is to be built at Nethy Bridge, designed by Mr. Gilbert, Grantown.

At Swansea a Local Government Board inquiry was held to consider the application of the Corporation for an additional loan of £100,000 for the Cray water scheme.

The Dewsbury and District Joint Infectious Hospital Board has applied for sanction to borrow £22,000 for the provision of an infectious hospital at Chickenley Wood, Soothill, Leicestershire.

A new iron church, to be known as All Saints, has been erected at the Blowick end of 11 Saints parish, Southport. The church will have accommodation for about 500 persons.

ROSSINGTON CHURCH, Yorkshire, has been restored. A gallery has been removed from the west end and an organ chamber erected at the site of the old vestry. Oak choir stalls have been substituted for the old square pews, and the font has been removed under the tower.

The London and South-Western Railway Company is seeking powers to construct a light railway across Salisbury Plain, commencing at point on the main line between Porton and Tisbury, and proceeding by way of Amesbury and Shrewton. It is stated that the line will be about 10½ miles long, and will cost about £60,000 in construction.

Under Discussion.

STAINED GLASS.

At the usual monthly meeting of the Glasgow Architectural Association, held in the rooms, 187, Pitt Street, recently—the president (Mr. W. T. Connor) in the chair—Mr. Oscar Paterson, Glasgow Art Workers' Guild, and lecturer on Technology of Glass, City and Guilds of London Institute, &c., read a paper entitled "About Stained Glass." Treating of the Art side of the question, he summed up the salient points thus:—"Circumstance of material governed the Art of stained glass in its first stages of development. As 'Art' progressed with a greater force than 'industry,' stained glass was more or less trammelled by difficulties of material; but when a certain progress and facility was attained, each craftsman followed out his Art on the lines of his taste, temperament, or circumstance. Every stage of industrial progress is indicated in the development of stained glass, the most marvellous being in the present century." The practical side in design he explained on excellent slides illustrating old and modern work.

THE LIFE AND WORK OF WILLIAM MORRIS.

A lecture on the life and work of William Morris was given by Mr. F. S. Ellis before the Society of Arts on Tuesday afternoon, the 10th inst., Dr. Richard Garnett presiding. A number of tapestries and printed textiles were exhibited, illustrating Morris's decorative designs, as well as some transcriptions in his own handwriting, kindly lent by Lady Burne-Jones. The lecturer spoke from thirty years' personal friendship with his subject, and described his brief apprenticeship to Architecture and the social convictions which led to its abandonment. Yet the house built for him by his friend Philip Webb was the very first artistic dwelling of the new school as we know it to-day. His acquisition of Kelmscott Manor was one of the happiest strokes of fortune for his Art as well as his life. Renouncing the architectural career he began under Mr. Street, he also renounced painting, "because he could not make his figures move." Yet the tapestry of the "Four Seasons," lent by the South Kensington Museum, showed that he could draw the human figure admirably well. His great work, however, was to awaken the public to a sense of the hideousness of Victorian houses and furniture, and to help them by his lectures, writings, and designs, to beautify at least the interiors of their dwellings, and thereby give a stimulus to a better style of domestic Architecture in the generation to come.

WEST OF ENGLAND MASTER BUILDERS' FEDERATION.

The first annual meeting of the West of England and South Wales Federation of Building Trade Employers was held at Bath. The Chairman (Mr. A. W. Lethbridge), in proposing adoption of the report, said, as regarded the Employers' Liability Act, the Federation had approached their local society of architects, so that in future a clause should be inserted in the bill of quantities the same as a fire insurance clause, ensuring the same should be paid by the employer instead of by the contractor. The same line had now been taken by the other Federation, and a satisfactory result was expected. He was pleased to say that, at a special Council meeting by the National Association, held at Derby, a resolution was passed that the different counties in Great Britain should be divided into four county federations. The Workmen's Compensation Act was a very large question, and he was glad to be able to tell them something which had not come to their notice before. Up till the present they could not get at what percentage they would have to pay after July 1. Some thought it would be 30, others 40, and some 50 per cent. £100 wages, but the Builders' Accident Insurance had given them a fixed sum, viz., 15s. per £100 to fully insure against all these Acts.—The report was

adopted, and so was the balance sheet. The balance in hand was £17 14s. 5d.—Mr. Symonds, of Cardiff, was elected president, and Mr. E. W. Wooster, of Bath, vice-president.

"LEAD: ITS MANUFACTURE AND USES."

The monthly meeting of the Belfast Mechanical and Engineering Association was held in the Museum; Mr. Thomas Gillespie, president, in the chair. Mr. A. T. Turner read a paper entitled "Lead: Its Manufacture and Uses." Having described the characteristic qualities of the metal, the writer stated that the principal sources from which the ore is obtained are situated in Great Britain and Spain, but he mentioned that there was at least one deposit near at hand—namely, at Newtownards—which, however, is not worked. There are various methods of treating the ore, the principal of which are the ore hearth or Scotch furnace, and precipitation in a blast furnace with another metal, generally iron. In order to recover the lead which is carried over with the fumes from the furnace, the gases are passed through long, tortuous passages on the way to the chimney. These passages are sometimes several miles in length, the gas taking, in some cases, three and a half hours to reach the chimney. As there is generally a certain quantity of silver found in conjunction with the lead, several processes of desilverising are in use, the principal of which, Rosen's, was described. For the manufacture of sheet lead the metal is melted in lots of about ten tons, and cast into cakes 7ft. 10in. by 5ft., and these are passed through a rolling mill about 150 times, when the sheet is about 30ft. long by 7ft. 10in. wide. This is then cut into sheets of various sizes by a series of knives in connection with the rolling mill. The lining for tea boxes is made by the Chinese in a very primitive way, by hammering it between two flat stones covered with paper. The sheet is, notwithstanding, very uniform in thickness. The manufacture of lead pipes and of shot was described, and also the use of lead in alloys.

ART AND CHARITY.

Sir H. Campbell-Bannerman, M.P., presided, at the Hôtel Métropole, over the eighty-third anniversary dinner of the Artists' General Benevolent Institution, and, proposing "Prosperity to the Institution," said since its foundation it had expended £122,398 in relief of distress. Last year 234 applicants received at its hands £4095, the only claims recognised being those of merit and need, and the dignity and self-respect of the recipients being safeguarded by the fact that their names were not divulged. In the political sphere much was said nowadays of opening up new markets in countries where, he feared, there would for some time to come be little demand for pictures and statuary. But artists created their own markets by producing a higher and higher level of Art, whereby interest was created, sympathy was engaged, and the desire for possession was created. Every year even an ignoramus like himself could see the progress that was being steadily made in British Art. Artists did not work for themselves; they worked for the public, and no one, not even the most unæsthetic—and to nobody more properly than to himself did that description apply—could fail to appreciate the enormous advantage to the country of that independent body of men of genius who worked, not for money or glory, but because they possessed a capacity and desire which compelled them to strive to raise the taste, brighten the homes, and brighten the lives of the people among whom they lived.—Mr. Frederic Harrison proposed "The Royal Academy and Kindred Societies."—Mr. Davis, R.A., and Mr. Waterlow, A.R.A., responded.—Mr. Alma Tadema proposed "Our Guests," and Mr. Comyns Carr responded.

The Duke of Atholl has decided to demolish Dunkeld House, and to build a much larger mansion, to be called Dunkeld Castle, in the neighbourhood.

Enquiry Department.

"SPECIFICATION" Enquiry and Legal Departments.

The replies to queries in the "Enquiry" and "Legal" Departments of the "Builders' Journal" being necessarily limited by consideration of space, readers who wish to obtain more complete and exhaustive answers are recommended to apply to the "Legal" and "Enquiry" Departments of "Specification."

Legal advice and opinions on Professional and Constructional matters will promptly be sent through the post.

Rules with regard to these enquiries will be found on page 2 of "Specification."

Terms of Subscription:—12s. per annum, payable in advance, for the first four quarterly numbers, carriage paid to any part of the United Kingdom. Subscribers abroad are requested to remit an additional 2s. 6d. to cover the extra cost of carriage.

CORNISH VIADUCTS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would your contributor, Mr. Charles G. Harper, kindly oblige me with the names and heights of as many of the Cornish viaducts as are known to him?—Yours faithfully,
C. F. W. D.

The following is a list, as complete as I can make it, of Devon and Cornish viaducts, old and new, of any great size, on the G.W.R.:

Cochwood	Trenance
Blackford	Gover
Cornwood	Carvedras
Ivybridge	Carkenwich
Pennycomequick	Truro
Keyham	Redruth
Westonmill	Renpons
Saltash Bridge	
Trematon, Saltash	Falmouth Branch:
Creek	Penwithers
St. Germans	Ponsanooth
Tresulyan	Treliever
Tevalya	Collegewood
Coldrewick	
Treveddo	Ashburton Branch:
Liskeard	Ham Green
Moorswater	Bickleigh
S. Austell	

There are some forty smaller ones. The highest of the larger range from 153ft.

CHARLES G. HARPER.

THE foundation stone has been laid of a new organ chamber, to be erected on the west side of the little church at Fauls, Whitchurch. Mr. Edmund Ferry, of Spring Gardens, London, is the architect, and the builder is Mr. G. Dodd, Whitchurch.

AN appeal is being made for £2000 to carry out the necessary repairs to East Horndon Church, Brentwood, which is of fifteenth century construction, but has been closed on the order of the Bishop as unsafe until it can be put into good order.

THE foundation stone has been laid of the chapels at the new cemetery which is being formed at Brandwood End, King's Norton, by the King's Norton Rural District Council. Mr. F. Brewin Holmes is the architect, and Mr. E. J. Charles the builder.

THE decoration of the chancel of Lustleigh Church has been completed by the fixing of the reredos, designed by Mr. Hallward. It is the gift of Mrs. Wise, who has also carved the frame of the reredos and the four panels which divide the paintings. The subjects of the paintings are the Nativity, the Angel and the Shepherds, and the Adoration of the Magi.

KEYSTONES.

THE foundation stone has been laid of the new church of St. Aidan, in the parish of Bradford, Manchester.

THE memorial stones have been laid of the Independent Methodist school chapel at Chorley.

THE foundation stone has been laid of a new block of buildings for church schools at Kettering, which will cost about £5000.

THE new elementary schools at Dursley have been formally opened. The building cost about £2000.

A PUBLIC HALL is to be built at Pitlochry, Scotland. Competitive designs for the hall are to be invited.

THE Birkenhead Town Council has decided to municipalise the borough tram system, and to provide the town with electrical tramways at an estimated cost of £182,000.

A LOCAL GOVERNMENT BOARD inquiry has been held at Mablethorpe into the application of the Urban District Council to effect a loan for constructing public walks and promenade, and the erection of cabstands, &c.

AT Swansea a Local Government Board inquiry has been held respecting an application from the Corporation for provision to borrow another £100,000 on account of its new water works scheme at Cray.

THE foundation stone has been laid of the new Town Hall at Enniskillen. The building, which is to cost close on £10,000, is being erected by Mr. James Harvey, the contractor, from plans prepared by Messrs. Anthony Scott and Son, Drogheda.

THE new Victoria wing of the Morley Convalescent Home for Working Men at St. Margaret's, Dover, has been opened. The new wing provides for the accommodation of sixty more patients, as well as a large dining-hall and administrative offices.

SPIERS AND POND, the well-known hotel proprietors and caterers, have just completed the purchase of nine acres of land in the Park, Buxton, whereon to erect a hotel of the premier class. The architects for the building are Messrs. Bodley and Garner, of London.

THE Harold Club, at Low Moor, has undergone extensions. The principal alterations have affected the assembly room on the ground floor, which has been considerably enlarged, whilst immediately above it the billiard-room has been similarly extended, all at a cost of about £850. Mr. F. W. Milligan, Healey, was the architect.

THE Working Men's College, Great Ormond Street, London, is about to be extended at a cost of £15,000. The new buildings contemplated will include a large hall for lectures and meetings, a laboratory for the science classes, and a larger museum. The new buildings, which will be in the rear of the college, will be known as the "Tom Hughes Memorial Buildings."

IN the Queen's Bench, Miss Jervis Smith, of Brooksford Hall, Doveridge, near Derby, obtained £555 damages and costs against a Weybridge builder named Greenfield in respect of a broken arm, sustained by the fall of a greenhouse cistern, which defendant had fixed at her aunt's house. Justice Day observed that there had been gross and childish negligence on the part of the defendant.

A MONUMENT has been erected in Whittington churchyard to the memory of the late Bishop Walsham How. The memorial is of brown Portland stone, and stands about 20ft. high. It takes the form of an octagonal column standing on a massive square base of three steps. On the column is carved a bishop's staff and mitre, and a figure of the Good Shepherd, recessed within a cross, forms the apex.

THE Secretary of State for War has promised a site for the proposed new Rochester Diocesan Sailors' and Soldiers' Home, to be erected in Military Road, Chatham. The plot of ground referred to is a portion of the Government enclosure known as "The Shrubbery"; and the Secretary of State has signified his willingness that the Chatham Corporation should lay out the rest of the land as public pleasure gardens.

CONTRACTS OPEN.

TO BUILDERS.

The Commissioners of H.M. Works and Public Buildings are prepared to receive TENDERS for the ENLARGEMENT of the Head Office at Guildford.

Drawings, specifications, and a copy of the conditions and form of contract may be inspected, and forms of Tender obtained, on application to the Guildford Postmaster.

Bills of quantities will not be supplied.

The Commissioners do not bind themselves to accept the lowest or any Tender.

Tenders are to be delivered before TWELVE o'clock noon on WEDNESDAY, the 25th inst., addressed to the Secretary, H.M. Office of Works, &c., 12, Whitehall-place, London, S.W., and endorsed "Tender for Guildford Post Office Enlargement."

REGINALD B. BRETT,

H.M. Office of Works, &c.

May 11th, 1898.

FIVE SHOPS, 67 to 75, Goldhawk-road, W. (Geo. Soley, Esq.)

BUILDERS desirous of Tendering for the ERECTION of the above ONE-STORY SHOPS (with basements) will please send in their names to the Quantity Surveyor, Mr. H. BUSHELL, 33, New Bridge-street, Ludgate-circus, E.C., on or before MAY 24th, after which date quantities will be sent out.

The plans, &c., can be seen at the Surveyor's office. The owner does not bind himself to accept the lowest or any Tender. WALT. J. WOOD, Architect.
1, Finsbury-circus, E.C.

HORNSEY URBAN DISTRICT COUNCIL.

TO ENGINEERS AND IRONFOUNDERS.

The Hornsey Urban District Council are prepared to receive TENDERS for the SUPPLY of about 150 pairs of TREE GRATINGS.

Tender forms and particulars may be obtained on application to Mr. E. J. LOVEGROVE, C.E., Engineer to the Council.

No Tender will be considered unless on the prescribed form.

Sealed and endorsed Tenders are to be deposited in

LONDON PLATE-GLASS INSURANCE CO. Ltd.

Head Office: 49, Queen Victoria St., E.C.

Glass of all kinds covered by the Policies of this Company.

MODERATE RATES. PROMPT REPLACEMENTS. SURVEYS AND ESTIMATES FREE.

Ten per cent. of the Premiums returned every six years in cases where no claim has arisen.

SUPPLEMENT FOR

SURVEYORS · BUILDERS · SANITARY ENGINEERS.

MAY 18TH, 1898.

Builders' Notes.

WITHOUT attempting to fix any responsibility for the collapse of the large building at Westminster which recently caused the loss of so many lives, we may point out that the evidence given at the inquest was peculiarly alarming. It was stated that some of the bricks used were so soft that they crumbled to pieces in the hands of the bricklayers, and that large numbers of them had to be sent to the mortar-mill. Yet "thousands of these bricks," we are told, were used in the walls, while the iron girders were left unbolted—merely, it would appear, resting on this flimsy brickwork. The latter statement, it is true, was disputed; but the evidence altogether is highly significant. These collapses of new buildings are becoming much too frequent. Only recently we reported another case in which several persons were injured. In regard to the Westminster affair, the question which at once suggests itself is: Where was the District Surveyor, who is supposed to constantly examine buildings in progress?

A MEETING in connection with the Yorkshire Federation of Builders' Associations was held at Keighley recently, when the principal speaker was the Mayor of Huddersfield (Alderman Jessop), who, alluding to the Workmen's Compensation Act, prophesied that many of the smaller contractors would be ruined by the increased demands of the new Act, in the event of a few unfortunate accidents occurring, unless they had their workmen insured. He thought it was coming to this—that contractors would have to specify an allowance for insurance when making out their estimates for contracts.

CONSIDERABLE progress is being made with the harbour works portion of the Midland Railway's Heysham scheme. The contracts for the construction of the two breakwaters and pier, which were secured by Messrs. Price and Wills, of Westminster, came to £480,000—an outlay which makes no provision for the various dry and wet docks which will have to be constructed later. It includes merely the excavation of a harbour of forty-six acres, the construction of a pier 2000ft. long down the centre, and the completion of the two break-

waters, the longer one to be a mile and a half in length, the other about a mile. These breakwaters are to consist of embankments 500ft. wide at the root, and tapering to 150ft. In operations of this nature there is always a great amount of preliminary labour to be gone through. In this case the contractors have had to lay down some seven miles of working roads, and for their water supply they found it necessary to put in about 7000ft. of pipes before they could commence operations in real earnest.

THE breakwaters are not being built up to their full height or width, but are being raised just sufficiently to hold the sea at bay in the roughest weather. One of the embankments has already been carried out some 1500ft., and the other about half that distance. They are already well above high-water mark, though there is another 6ft. to be added to their height. The contractors anticipate that they will get the embankments round the site of the new harbour in about another twelve months. The embankments are built up on a solid foundation of rock. A trench is scooped out, 7ft. deep and 25ft. wide, and is then filled up with rock. This is the foundation for the toe of the breakwater. The embankment is 20ft. high at the start, and increases in height as it goes further out. In the work of removing the cliffs, some 2,000,000 cubic yards of soil will have to be got out; in making the harbour about the new pier navigable for vessels, some 1,500,000 cubic yards of sand will have to be excavated.

At a meeting of the St. Giles's Board of Works, the Works Committee reported that they had considered the question of widening High Holborn between Southampton Row and Southampton Street, and were of opinion that, in rebuilding, the line of frontage should be set back 7ft. The surveyor (Mr. Wallace) said he was informed at the Bedford Estate office that the London County Council had been inquiring on what terms the street could be widened by 10ft. After some discussion, the Board decided to ask the Council to widen the street to this extent.

An important street improvement is about to be carried out at Cardiff. Allusion is made to the widening of Working Street, an operation which has been quietly but steadily in progress for the past year. Working Street, as it at present exists, is a far different thoroughfare from what it once was. In 1854

its width was only 22ft. It was not altered till 1875, when the width was increased to 36ft. By the Corporation Act of 1894 it was increased at the widest part some 15ft., and it is now about 50ft. wide on an average. The widening of Working Street is not the only improvement which has been made. The Corporation, empowered by Parliament, have taken a portion of the churchyard on the north for the purpose, and the graves and their contents have been removed to the cemetery. On the south side of the churchyard the rough rubble wall which acted as a barrier between God's acre and the outside world has been pulled down, and in its place a dwarf wall, surmounted by an iron railing, has been put up. In addition, a footpath, crossing the churchyard from the entrance to the market to Working Street, has been made.

THE Court of Common Council, at the meeting last week, had under consideration the report of the Streets Committee relative to the inquiry in respect of contracts in regard to which there has been much comment of late. The allegations reflected on the contractors for engineers' and smiths' work—Messrs. J. F. Clarke and Sons—and certain officials of the Public Health Department, and were to the effect that the four inspectors of pavements and other subordinate officials were in the habit of receiving periodically gratuities from the contractors, and that the vouchers signed by the inspectors contained entries as to time which had not been expended on the work, and that in respect of some of the vouchers no corresponding work was done at all. The information was voluntarily supplied to the City Solicitor by two discharged clerks of the contractors. The inspectors emphatically denied having received any gratuities whatever, but the contractors, who at first also denied the statement, eventually admitted that they had made various payments to officials of the late Commission of Sewers for many years past. During the years 1896 and 1897 periodical payments had been made to the four inspectors of pavements, amounting to from £60 to £70 each, and smaller sums to minor officials. The committee recommended the dismissal of the four inspectors and a fifth official and the stopping of the pension of another person. They also recommended that no further orders should be given or payments made to Messrs. Clarke, and that the committee should be permitted to continue their inquiries with a view to the institution of such proceedings as the circumstances might appear to justify.—The report was adopted.

POLICE STATIONS AND PRISONS.

By GEORGE H. BIBBY, F.R.I.B.A.

VI.—CONCLUSION.

IN the year 1796 there were eighteen prisons in London, but fifty years later these had been reduced to about one dozen. A writer of the latter period stated that all the great London gaols were provided with stands of arms by which men could be armed in a few minutes, besides signal-rockets, which would instantly convey intelligence to the Horse Guards and to the barracks in St. James's and Hyde Parks, of any attack, so that 2000 or 3000 men could be concentrated at any prison in half-an-hour. From this it may be assumed that the planning of stone prisons included a considerable provision of apartments for other purposes beyond the housing of prisoners and turnkeys, &c.

At the King's Bench prison, at the time of a plague, privileges for prisoners to reside within three miles of the prison were first granted; such persons were known as prisoners within "The Rules," and for these rules large sums were paid to the Marshal, who, in one year (1813) received no less than £2823 from the rules and "liberty tickets," and £872 from the sale of beer; this was probably one reason for excluding publichouses and places of amusement from the privileges of the rules. In later years the rules were abolished, the prisoners classified, and the prison became eventually a military institution.

This prison originated in very early times; it was probably coeval with the Court of Queen's Bench itself. At a very early period there were three principal prisons in London—the Queen's Bench Prison, the Fleet Prison, and the Marshalsea.

The Queen's Prison was appropriated to prisoners committed by the Court of Queen's Bench, the Court of Exchequer, and Court of Common Pleas; the Fleet Prison received prisoners from the Court of Chancery; and the Marshalsea from the Lord Steward's Court, the Palace Court, and the Admiralty. The number of prisoners to be found in the Queen's Bench Prison was usually very great, for prisoners from any other prison could be transferred there by writ of *habeas*. Prisoners are said to have availed themselves of this privilege, because in the Queen's Bench they had amusements, such as playing at ball and other games, by which time was whiled away.

Such prisons as the above contrasted greatly with others contrived in earlier times. For instance, in the Tower of London chambers were specially planned for the torture of the prisoners, and one of these was called "Little Ease," and was so constructed that the prisoner found it impossible to stand erect or to lie down except in a cramped position. Other cells are said to have been full of vermin, especially rats, which at high water were driven up in shoals from the Thames.

But perhaps one of the most terribly-devised prison cells was that said to have been erected in an Italian prison, and which was so contrived that the walls very slowly approached each other (it is difficult to conceive how this could have been done), while the ceiling descended (during seven days), finally crushing the occupant to death, his bed, by an ingenious arrangement, being converted into a coffin when touched by the approaching walls.

The glaring defects of the prisons existing at the commencement of this century appear to have been well known to many writers, and particularly to the late Charles Dickens, who describes a foreign prison on a certain very hot day in these words: "In Marseilles that day there was a villainous prison. In one of its chambers—so repulsive a place that even the obtrusive stare blinked at it, and left it to such refuse of reflected light as it could find for itself—were two men. Besides the two men, a notched and disfigured bench, immovable from the wall, with a draught board rudely hacked upon it with a knife, a set of draughts made of old buttons and soup bones, a set of dominoes, two mats,

and two or three wine bottles. That was all the chamber held, exclusive of rats and other unseen vermin, in addition to the seen vermin—the two men. It received such light as it got through a grating of iron bars, fashioned like a pretty large window, by means of which it could be always inspected from the gloomy staircase. There was a broad, strong ledge of stone at this grating, where the bottom of it was let into the masonry, 3ft. or 4ft. from the ground. A

FIG. 15.

prison taint was on everything there; the imprisoned air, the imprisoned light, the imprisoned damp, were all deteriorated by confinement. As the captive men were faded and haggard, so the iron was rusty, the stone was slimy, the air was faint, the light was dim. Like a well, like a vault, like a tomb, the prison had no knowledge of the brightness outside, and would have kept its polluted atmosphere

intact in one of the Spice Islands of the Indian Ocean." This is evidently the description of cell taken from actual observation; the insanitary condition of such apartments in other respects is not even hinted at, but very little consideration is necessary for concluding that persons confined in such rooms from one year's end to another, without being permitted once to leave them for any purpose, must have suffered untold agonies.

The same writer also describes English prisons of the period, and amongst them the Marshalsea, to which I have before referred. He writes as follows:—"Thirty years ago there stood, a few doors short of the Church of St. George, in the Borough of Southwark, on the left-hand side of the way going southward, the Marshalsea Prison. It had stood there many years before, and it remained there some years afterwards; but it is gone now, and the world is none the worse without it.

"It was an oblong pile of barrack building, partitioned into squalid houses standing back to back, so that there were no back rooms; environed by a narrow, paved yard, hemmed in by high walls, duly spiked at top. Itself a close and confined prison for debtors, it contained, within it, a much closer and more confined jail for smugglers. Offenders against the revenue laws, and defaulters to excise or customs, who had incurred fines which they were unable to pay, were supposed to be incarcerated behind an iron-plated door, closing up a second prison, consisting of a strong cell or two, and a blind alley, some 14 yds. wide, which formed the mysterious termination of the very limited skittle ground in which the Marshalsea debtors bowled down their troubles—supposed to be incarcerated there, because the time had rather outgrown the strong cells and the blind alley. In practice they had become to be considered a little too bad, though in theory they were quite as good as ever. Hence the smugglers habitually consorted with the debtors, except at certain constitutional moments when somebody came from some office, to go through some form of overlooking something, which neither he nor anybody else knew anything about. On these truly British occasions, the smugglers, if any, made a feint of walking into the strong cells and the blind alley, while this somebody pretended to do his something; and made a reality of walking out again as soon as he hadn't done it."

The condition of many prisons both of this country and of the Continent was, in earlier times, a source of great danger, not only to those immediately connected with them, but also to the general public; the filthy conditions of towns in England in former times is scarcely to be imagined; the unpaved streets were made the receptacles for filth and refuse of all descriptions. Cities and towns were thus converted into districts not less malarious than the swamps of the Indies. Renewal of air was never regarded as a vital necessity, and fearfully at times was the ignorance punished. In our judicial records will be found more than one mention of a "black assize," for instance at Oxford in 1577, three hundred individuals who had attended the court, as well as the judge and sheriff, died from "malignant" fever within forty-eight hours of the opening of the proceedings! The disease was communicated by the wretched prisoners who had been shut up for months in the noisome cells of an unventilated prison; and a similar instance occurred in London at the Old Bailey in 1756, when the Lord Mayor, the two judges, besides several persons of note, and others met their death as the result of "jail fever," caused by the insanitary and ill-ventilated prisons.

But there are very many difficulties of a nature special to prisons; as regards the ventilation of modern prisons. From the necessity of keeping the cells thoroughly isolated additional precautions must be adopted to prevent prisoners from speaking or telegraphing to each other by means of ventilating openings or flues. Any system that does not preserve isolation, while insuring a continuous change of air in each cell, is practically useless, and as there has really been no system by

ch several cells may be ventilated into one ft, while sound may be effectually pre-
ted from passing from one cell to another,
arrangement shown in Fig. 15 has been
ised with the view of overcoming the diffi-
y, and the system is contrived as follows :
Ve assume that it is required to ventilate a
k or wing of a prison consisting of, say,
e tiers of cells on each side, and composed
irty cells in each tier or row, making 180
s altogether.

Three brick flues, with an internal measure-
t each of 2ft. 6in. x 2ft. x 6in., are built
equal distances against each of the side
s and carried up above the roof, where
are surmounted by a self-acting air-pump
tilator, 4ft. in diameter. Three horizontal
fts run along each tier, immediately under-
th the ceiling close to the wall, or they may
uilt in the wall as shown. Each of these
fts is connected with ten cells by means of
ected openings, varying in size according
he distance of the opening from the upcast
ft, so as to equalise the quantity of air
acted from each cell. Three of these
izional shafts (one on each tier) are
ected with one of the upcast shafts
ch forms a junction in the centre. The
izional shafts vary in size according to
r proximity to the top of the upcast shaft,
as to equalise the quantity of air drawn
n each tier. A ring of gas jets is fixed at
bottoms of the upcast shafts for the pur-
e of warming them in cold weather, and
venting condensation of the ascending
umn of vitiated air. The advantages of
system, which has been carried out by
rs. Robert Boyle and Son Limited, of
don and Glasgow, are, that every cell is
ally and separately ventilated, whilst per-
isolation is secured; it is impossible for
ads to pass from one cell into another through
ventilating shafts or openings, whilst as
ay as from ten to twenty cells can be venti-
d with one pipe, and three or four of them
into one upcast shaft. An important point
hat there are no valves used in connection
h any part of the system, so that when
fixed further attention is not required,
the ventilation cannot be interrupted
ugh negligence, as is usually the case
re ventilating arrangements are employed
t require much looking after. Fresh
med air is introduced into each cell
ugh vertical channels cut in the walls,
ected outside and inside with strong iron
tings, and fitted with an air-warming
ngement. These channels open into the
eries on the inside of the building, and are
plied with air from two large openings at
h end of the block, through which the
h air passes over a heating arrangement in
l weather, so that it is thoroughly warmed
re entering the cells, through which it
st pass before finding an exit. In an
lier chapter I have given illustrations
wing other modes for ventilating police-
ion cells where these are arranged upon
floor level only, but wherever there are
er floors to be ventilated, and large
ubers of prisoners to be arranged for, the
nning of the buildings necessarily becomes
licated, not only as regards ventilation,
as regards all details of construction.

an inquiry has been held at St. Helen's
vn Hall, into an application by the corpora-
a for sanction to borrow £13,000 for the pro-
ion of refuse destructor works at Boundary
ad.

HE question of the provision of artesian
ls for public water supplies to small towns
l villages without resorting to an expensive
tem of pumping appears to have been solved
he parish of Alveston, a suburb of Strat-
lon-Avon. The history of the scheme
es back several years, and water for
nestic use was obtained from shallow wells,
ny of which were said to be polluted. Some
ishioners decided upon the construction of
artesian well, and a loan of £1100 was
sed. The work has been completed, and
abundance of excellent water provided. It
ntended to construct a small reservoir near
he well.

Surveying and Sanitary Notes.

At the meeting of St. George's Vestry, Southwark, a question concerning the in-
sanitary condition of the church of St. George-
the-Martyr, Borough, was considered. The
Public Health Committee reported that the
Medical Officer of Health (Dr. Waldo) had,
at the request of the rector (the Rev. F.
Somerville), inspected the crypt of St. George's
Church. He reported that the air was musty,
that bones were lying about, and that there
were cracks in the walls which made the church
dangerous by allowing effluvia to escape into
the building. After some discussion, a motion
for the question to be referred back to the
committee for some action to be taken was
adopted.

THE new graving dock at Cessnock, for the
Clyde Trustees of the harbour and docks of
Glasgow, has been opened. It is large enough
for the biggest warship or liner likely to be
built for many years. The entrance to the
dock is 85ft. in width. A gate divides the
dock into two lengths of 460ft. and 420ft. re-
spectively, and there is thus accommodation
at one time for two steamships of considerable
size. At the bottom of the dock the width is
87ft., and at the top it is 115ft. The depth
of water is 26½ft. The bottom consists of a
brick invert nearly 6ft. thick, covered by con-
crete 6ft. thick at the centre, and about 18in.
at the sides, so as to give a camber. The
floor is causewayed with granite. The side
walls are of concrete increased in 12-inch
sheet piling and a brick wall. The alters, or
steps, are of concrete, faced with granolithic,
and the side walls and end walls are sur-
mounted by a massive granite cope. The
total cost of the dock, including pumping and
other apparatus, is about £240,000. Mr.
James Deas, the engineer of the Trust, is the
designer of the dock, and the works have been
undertaken by the Trustees' own employees
under the superintendence of Mr. Deas.

At the Guildhall, Norwich, Mr. Arnold
Taylor, C.E., of Westminster, has sat in an
arbitration case of disputed compensation
under the Public Health Act of 1875, between
Mr. Henry Hides, merchant, of Red Lion
Street, and the Corporation of Norwich in
respect of the construction of a sewer through
land owned by Mr. Hides, situated between
Hellesdon Road and the Watering, Heigham.
The sewer was constructed in July, 1897, and
Mr. C. C. Rix Spelman, acting on behalf of Mr.
Hides, claimed £325 damages. The Corpora-
tion and Mr. Hides could not agree as to the
amount of compensation, so Mr. Hides
appointed Mr. Spelman as arbitrator. The
Corporation appointed the city engineer as
their arbitrator. The two arbitrators could
not agree, so Mr. Hides applied to the Local
Government Board to appoint an umpire, and
the Local Government Board accordingly
appointed Mr. Arnold Taylor. After the
evidence the umpire reserved his decision
pending a personal inspection of the land.

THE Medical Officer of Health for Worces-
tershire (Mr. G. H. Fosbrooke) has, at the
request of the Sanitary Committee of the
County Council, investigated the working of
bacteriological filters, or, as they are sometimes
called, bacteriological tanks, as a means of
dealing with sewage. In summing up his
report on the working of various appliances of
this character, he points out that even though
some of these bacteria tanks have been tried
on a practical scale, still they cannot be said
to have as yet passed beyond the experimental
stages. The action of suitable land (the best
of all sewage purifiers) and of bacteriological
filters, is much the same. Indeed the inter-
mittent filters act very similarly to the down-
filtration beds laid out many years back by
Mr. Bailey Denton, on the advice of Dr.
Frankland, at Merthyr Tydfil. "For such
reasons," he proceeds, "I submit that the
bacteriological tanks are most promising, and

will probably lead to a revolution of sewage
disposal. That this is so, is evidenced by the
fact that Parliament, acting on the advice of
the Local Government Board, have just ap-
pointed a Royal Commission to report on sewage
disposal generally. Should the bacteriological
tanks prove as successful as they promise to
be, then many local authorities will most
probably be relieved from the too often in-
superable difficulty they experience in provid-
ing land for sewage treatment, without which
the Local Government Board will not at
present sanction any sewerage scheme. It
seems to me probable that in the near future
the present regulations of the Local Govern-
ment Board with respect to sewage will have
to be materially modified, and that even should
the provision of land be insisted upon, still
the adoption of the bacteriological system will
so greatly assist in the disintegration of such
refuse that the area asked for will be con-
siderably less than it now is. As previously
stated, the gentlemen who have developed the
bacteriological tanks affirm that the effluent
from sewage after such treatment may safely
be passed into watercourses; but in my opinion
the relative proportions of the effluents and
the streams must be carefully taken into
account. Of course it should be borne in mind
that the rates of purification are governed by
the extent, depth, and construction of the
filters, and that in cases where sewage effluents
of high standards are necessary the filtering
operations must be proportionately perfected.
With respect to the character of the sewage
with which bacteriological tanks are capable
of dealing, a decidedly open view should be
entertained, for, in my opinion, it is not at
present proved that manufacturers' refuse can
be satisfactorily dealt with, or that acid waste
refuse if perceptible in sewage will not stultify
microbial action."

An important case has been disposed of in
the House of Lords. It was that of Pasmore
and others v. Oswaldtwistle Urban District
Council, and was an appeal from a decision of
the Court of Appeal. The action was for a
mandamus commanding the defendants (re-
spondents in the present appeal) to cause to be
made such sewers as may be necessary for
effectually draining their district for the
purposes of the Public Health Act, 1875, and
to give facilities for enabling the plaintiffs to
carry the liquid proceeding from his factories
or manufacturing processes into the sewers
under their control. The action was begun
by Philip Cadell Peebles (since deceased) who
owned and carried on the business of paper
making at a factory called the Whiteash
Paper Mill, and before it was instituted Mr.
Peebles requested the defendants, and the
defendants refused, to provide sewers for the
reception of the liquids from the paper mill.
The claim was based on the Public Health
Act, 1875, sections 15 and 21 of which impose
on a local authority the duty of providing a
proper sewage system. The respondents,
however, contended that such obligation was
not one towards the appellants or any indivi-
dual occupier, but for the benefit and purposes
of the whole district. They also relied upon
section 299 of the Act, which prescribes, as the
remedy in such a case, complaint to the Local
Government Board. That section enacts that
when such complaint is made the Local
Government Board, if satisfied after due
inquiry that the local authority has been
guilty of default, shall make an order limiting
a time for the performance of the duty so
neglected. That remedy, the respondents
urged, was the only and exclusive one in case
of any default by the respondents. The case
was heard by Mr. Justice Charles on Novem-
ber 11th, 1896, and by an arrangement the
question of law was argued before any evi-
dence was gone into. The learned Judge
granted the *mandamus*, but on March 18th,
1897, the Court of Appeal reversed that decision
and dismissed the action with costs.—The
Lord Chancellor, in now moving that the
appeal be dismissed, said there was nothing in
the Public Health Act which would justify
the issue of a *mandamus*. The whole purview
of the Act made impossible the application of
such a remedy.—The other judges concurred.

MASONRY.

BY JAMES WILDING.

IV.—THE ANNULAR VAULT.

WHEN a semicircular or other arch has to be turned over a passage which is circular in plan, it is necessary to develop the moulds as illustrated here. The line KN is the one usually difficult to grasp in its relative position to LJ. If it is kept in mind that KN represents a vertical line, this difficulty is lessened considerably. For the purpose of mould development, KN must be turned into view.

Taking X as centre, and XD, XE, XB, XA, respectively, as radii, describe the quadrants, continuing E to F and B to B1 on LJ. With C as centre, draw the elevation of the arch.

Divide soffit into three parts, lettered TUE (any number may be used, three are used here for sake of clearness). From C, through these divisions draw the lines CO, CS, cutting the line KN at S and O.

With S as centre and ST as radius describe S-8. With S as centre and SV as radius describe S-7.

These lines may be produced indefinitely, until long enough to cover the whole of their relative portion of the vault; it needs little explanation, however, to make it clear that this is unnecessary. Any convenient length may be taken, say 3ft., and the heading joint marked on from the centre S, the line 7-8 is the heading joint in this case.

Repeat this operation for the second joint, producing UW to cut KN at O. The work for this is exactly similar to that described for VT. The plans AB, ED, are similar to the plan of the wall.

The soffit developments are all shown. It is always difficult to convey the idea that the curved lines shown in these developments all represent lines parallel to the level line, and the further fact that when bent into position they fit each other. If the soffit mould No. 1 is cut from B1 to 9 and from 10 to 2 and bent round the plan BB1 the round line B19 will lie on the level paper. Similarly the other mould may be bent into position.

By arranging the various moulds together much description is avoided. It will be seen that these moulds represent the underside or soffit of the arch forming the covering, and are obtained by producing the lines to touch KN, this they do in H, E, and S respectively, the length of each soffit mould is decided on, and the plan of the heading drawn from the centre used to describe the relative curves.

It is advisable that the example be drawn on a piece of cardboard, in order to enable the various developments to be turned into position. The lines marked Hinge line on illustration indicate where best to turn the different figures.

CIRCLE ON CIRCLE ARCH.—In order to make this arch clear, a complete set of developments is shown. The jambs of the openings are taken parallel to WC. With C as centre, and C1, C7, as radii describe the elevation. Divide

The Annular Vault.

soffit into any number of equal parts (in this case five), from C draw joint lines through these points. From 6 to the left, set off on line NM the divisions 6 to 1, draw these lines square to NM, indefinite in length. Parallel to WC drop lines lettered 1 to 6 on soffit of arch, to touch the plan. Parallel to NM draw from these points to intersect lines 1 to 6 perpendicular to NM.

Tracing the curve through these points the face lines of the soffit of the arch is obtained. Similarly project lines for back of soffit, and draw lines through points of intersection. The moulds marked soffit moulds 1, 2, 3, 4, 5, give the required developments for the soffit. By inspecting the development of the extrados or back, further description is rendered unnecessary.

To develop the joint mould 2:

Take the joint line p-a, square a-e from p-a, square c-f from p-a, square p-h from p-a, drop p to touch plan, drop a to touch plan, drop c to touch plan. The amount of curve from 5 to Q on plan is the amount in the face line p-a. From 5 on plan draw a line at right-angles to 5a, the distance a-b in plan is transferred to the elevation, and is set off from a on a E.

Similarly the distance c-d is set off on c-f; from b, through d to p draw the curved face line bdp.

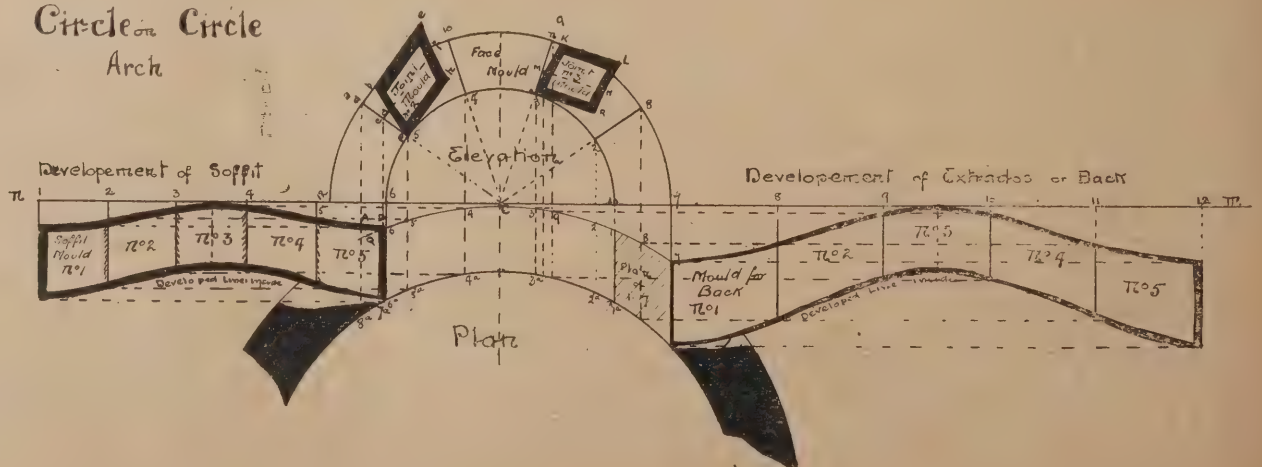

The contour of the back face line efh is obtained by gauging from 5 to 5a, d to 7a, a to 8a (all on the plan), and transferring these measurements to the elevation, making p-h equal 5, 5a, c-f equal d, 7a, a-e equal a, 8a. The line efh is the shape of the face at back.

Joint mould No. 3 is developed in a similar manner, the amount of curve being very slight.

The ordinary face mould can be used for the arch stones, the soffit back and joints finished therefrom. The faces are worked from the joint soffit and back moulds, and with a template made to fit the plan, used horizontally.

STEADY progress continues to be made with the Welsh water scheme for the Birmingham Corporation. The Knighton tunnel has just been completed. Forming portions of the conduit from the Elan Valley to Birmingham will be two tunnels, about 8ft. in diameter. One of these, four and a half miles in length, and nearest to the Elan Valley, is the Dolau tunnel. The other is the Knighton tunnel, extending from the town of Knighton to the Lugg Valley, a distance of two and a half miles. Headings for this tunnel were commenced at either end. The two sets of excavators have now been able to join hands. The case of the Dolau tunnel, owing to its greater length and the need for shafts to remove the excavated material, was commenced in two sections. The first half was completed a month ago, and, although the calculations and measurements had to be made upon the data afforded by a base line of only 16ft. at the bottom of a 300ft. shaft, they were so accurately worked out that the centre lines of the two headings met accurately as regards level, and with an horizontal divergence of no more than half an inch.

Circle on Circle Arch

THE LONDON BUILDING ACT.

A NEW QUESTION RAISED.

IN the Queen's Bench Division recently, before Mr. Justice Wills and Mr. Justice Kennedy, the case of *Paynter v. Watson* was heard. This was a special case raising a new question under the London Building Act, 1894, section 43, as to the right of an owner of premises to rebuild them in a different manner to the old buildings without first obtaining the leave of the London County Council. Mr. Macmorran, Q.C., and Mr. Poyser appeared for the appellant; Mr. Ivory and Mr. Daldy for the respondent. The appellant was Major George Paynter; the respondent was the district surveyor of the district of St. George's, Hanover Square North. The case was stated on an appeal to the magistrate from a notice of objection served by the district surveyor under section 150 of the Act. The appellant had served a building notice under section 145 on the district surveyor, and had annexed thereto the plans and sections of the new buildings which he proposed to erect on the site of Nos. 12 and 13, Grafton Street. These plans showed that the new buildings would not cover any ground that was uncovered before, but the arrangement of the upper floors was such that a certain amount of the old existing air space would be occupied by the new buildings, which were to be higher and to contain more cubic feet than the old. The magistrate found that the plans of the proposed new buildings did deviate in certain respects, and particularly in regard to the height, from the plans of the old buildings, and he held that the word "deviate" in section 43 (2) applied not only to the ground covered by the old buildings, but also to that of the buildings in respect to height and width and depth on the several floors, and he therefore affirmed the surveyor's objection.

The London Building Act, 1894 (57 and 58 Vict., cap. ccciii.), section 43 is as follows:—"When any person intends to erect a domestic building . . . abutting upon a street on the site of domestic buildings existing at the commencement of this Act, (1) It shall be lawful for such person, before commencing to erect the intended domestic building, to cause to be prepared plans showing the extent of the previously existing domestic building in its

several parts . . . and to cause such plans to be submitted to the district surveyor, who shall (if reasonably satisfied with the evidence of their accuracy) certify the same under his name, and such certificate shall be taken to be conclusive evidence of the correctness of the plans. Such person may then erect the intended domestic building, but so that no more land shall be occupied by the newly-erected building than was occupied by the previously existing domestic building as so certified. If such person fail to submit such plans, . . . and the district surveyor, or the tribunal of appeal, refuse to certify the accuracy of the same, such person shall on rebuilding be bound by the preceding provisions of this part of this Act. (2) If a person erecting the intended domestic building shall desire to deviate in any respect from the plan or plans certified by the district surveyor, it shall be lawful for him to apply to the Council, who shall sanction such deviation on such conditions as they may think fit."

Mr. Macmorran said that the magistrate was wrong, and contended that the owner was within his rights so long as he covered no more or different ground with the new buildings than the old buildings covered. He did not argue that section 43 gave an unqualified right to rebuild. It was only intended to give the rebuilder dispensation for the requirements of section 41 (2) as to amount of air space to be left for the benefit of the neighbouring houses. The "plan" referred to in the section meant only a ground plan. He referred to section 47, and said that that would apply. The gist of the difficulty was this—that the appellant said that he could build on the old area to any height subject to section 47. The County Council, on the other hand, said that not only the ground area must be the same, but the cubic contents.—Mr. Ivory, on behalf of the district surveyor, pointed out that Part V. of the Act, in which part this group of sections was to be found, was headed, "Open spaces about buildings and height of buildings." The Court supported the magistrate's decision.—Mr. Justice Wills said he had in this case no doubt, All depended on what was meant by "the plans showing the extent of the previous existing domestic building in its several parts" in section 41 (1). It would be the most extraordinary synonym for ground plans possible. It was clear that a complete set of plans was intended. If a person chose to rebuild an old

house exactly as it was, he might get the protection of this section. The cardinal condition of the section was that no ground previously uncovered should be covered. But if a person desired to deviate in any respect, and not in one respect only, then he was subject to the jurisdiction of the County Council. The general purview of the Act was the limitation of private rights over property for the general good. If the building owner desired to alter his old buildings, he must submit to the discretionary sanction of the County Council.—Mr. Justice Kennedy concurred.

Trade and Craft.

MESSRS. JAMES GRAY AND SON, EDINBURGH.

This firm of general and furnishing iron-mongers, whose business premises are at 85, George Street, Edinburgh, send a well-prepared catalogue of their goods. Of ranges and stoves may be mentioned, as embracing the latest improvements, the heavy "Al Simplex" patent convertible close or open ranges, the "Suburban" and "Villa" ditto, the "Portdownie" self-setting ditto, the "Artisan" self-acting and self-setting open fire range, cottage ranges, mantel registers, the patent "Simplex" register stoves, &c., all of a design and cost suitable for houses from the mansion type to a cottage. Tile kerbs or fenders are illustrated in interesting variety. The firm direct attention to their system of hot water circulating apparatus, for giving a constant supply of hot water to the scullery, bath, and lavatory, and for other purposes. They recommend the system as being superior to the ordinary methods of supply from a kitchen range, theirs being furnished from a hot water cylindrical tank, and it is stated that the "water heats more rapidly and regularly; the boiler can never be drawn empty; and a ball cock cistern is entirely dispensed with;" also that there is greater "convenience for cleaning boiler and cistern," and that the system is one of "absolute freedom from danger." The firm send workmen to any part of Great Britain to execute orders for this system. Household requisites of all descriptions are amongst the furnishing ironmongery supplied by Messrs. Gray and Son, who also make a feature of tinsmith work and repairs.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.

R.I.B.A. EXAMS. PREPARATION.—personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

ARCHITECTURAL INSTITUTE and CIVIL SERVICE TECHNICAL EXAMINATIONS.—Preparation by correspondence, personally, or in residence. Fourteen first places.—G. A. T. MIDDLETON, 19, Craven-street, Strand, W.C.

OLD-ESTABLISHED BUILDER'S and DECORATOR'S BUSINESS.—Owing to the intending retirement of the proprietor of a country business 25 miles from London, an opportunity occurs for a PARTNERSHIP ARRANGEMENT with his son. Capital chance for a steady, capable man to acquire share in genuine old business in full work. Capital required, from £500 to £1000.—Write in first place to "Contractor," care of J. W. Vickers, 5, Nicholas-lane, Lombard-street, E.C.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES to ASSIST others in the PREPARATION of DRAWINGS at his own office.
G. SCORER, 23, Newman-street, W.

ARCHITECT and SURVEYOR'S ASSISTANT, A.R.I.B.A., desires RE-ENGAGEMENT. Ten years' experience of good work.—"Hurstmonceux," BUILDERS' JOURNAL.

ARCHITECT'S JUNIOR DESIRES RE-ENGAGEMENT. Neat and quick draughtsman, tracer, and colourist. Plans from sketches or instructions. Knowledge of surveying. Salary 24s.—T. K. B., Forge House, Codnor Park, Derbyshire.

TWO DRAUGHTSMEN, with ten years' London experience in libraries, schools, warehouses, hotels, &c., and all constructional details, are prepared to ASSIST ARCHITECTS at own home.—Box 722, BUILDERS' JOURNAL Office.

ARCHITECT'S ASSISTANT (young) seeks RE-ENGAGEMENT in or near London. Good draughtsman. Well up in details, quantities, &c. London experience.—MITCHELL, 3, Wentworth-road, Rushden.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

EXPERIENCED ASSISTANT REQUIRED. Must be practical and smart draughtsman; well up in Engineering and Architectural details. Good opportunity for one desiring experience on public works.—J. FLETCHER TREW, County-chambers, Gloucester.

VACANCY occurs in a North of England Office for a very well-educated, gentlemanly YOUTH as PREMIUM PUPIL.—Apply, Box 708, BUILDERS' JOURNAL Office.

WANTED, immediately, FOREMAN of CARPENTERS for alterations and additions to country mansion. Must be good setter-out, and thoroughly reliable in every way.—Apply, J. L. and H. STEE, Builders, Clyst St. George, Exeter, with references.

QUANTITY SURVEYOR'S or BUILDER'S Competent ASSISTANT REQUIRED to take up extras and variations, large new building. Salary and commission. Must be fully qualified to adjust and render account.—Box 719, BUILDERS' JOURNAL.

GOOD PLASTERERS WANTED at once.—Apply J. HILTON, 37, London-road, Lynn, Norfolk.

BUILDING SURVEYOR WANTED. thoroughly experienced in taking off quantities and pricing. Good salary offered to fully-qualified man.—Apply, by letter only, to HOLLOWAY BROS., Victoria Works, Queen's-road, Battersea, S.W.

ASSISTANT (competent) REQUIRED at once in an Architect's office.—Apply, with testimonials and drawings, E. WILLEY, F.R.I.B.A., 33, New Bridge-street, E.C.

An Architectural Causerie.

An Art or a Profession? THE other morning, on arriving at the office, one found one's predominant partner in such a state of extreme excitement as he has not contracted since the episode of the Cardiff Competition awards. Indignation was, of course, the mainspring and sustainer of his passion. One's predominant partner never becomes really excited except when his indignation is aroused. On these occasions he may pass all bounds, save those of language. He may become inflamed and even purple in countenance, his hair may rumple up, he may seem incoherent and delirious, but never has he been known to become "speechless with indignation"; language never fails him, on the contrary, his eloquence rises to such heights of invective that one has often felt obliged to close the doors which separate us from our assistant, who is really an office boy, designated "assistant" by courtesy on the strength of an incipient moustache. As one uncovered one's board on this occasion one asked one's predominant partner what on earth was the matter, and whether he knew what he looked like at that moment. It then appeared that he had found, in the current issue of a professional journal, a reprint of a circular letter which some well-established architect had been sending to solicitors about the country, advertising his qualifications and his readiness to undertake the raising of buildings "always with the best designs," and blandly offering "twenty per cent. of my commission when received" to the addressed in consideration of his placing work with him. One's predominant partner gabbled the particulars from the sheet before him, and then stopped and looked across as though he expected one to fly out into some form of violence. Seeing this one restrained one's expressions of disgust, and merely asked him what there was for him to make so much fuss about. He replied with heat to the effect that such conduct was a degradation to the Profession—it brought it into ill-repute; he said that not long ago there was just such another case of circular letters of solicitation being sent by an architect to clergymen, and he went on instancing notorious instances of advertisement among architects till one felt bored and tired of his voice, and cut in to remind him that he had no right to consider Architecture a Profession at all. One explained that as Architecture had utterly failed us as a Profession—in point of fact one drops some £35 a year in the practice, and one's predominant partner, as having a larger share in the business, about £75 per annum—as it had utterly failed us as a Profession, one explained, we were bound to consider it an Art. At this one's predominant partner evinced symptoms as of having a great deal to say, but one had listened to him quite long enough, and one proceeded to tell him that one quite understood his violent animosity towards these advertising architects and their methods. If he was an artist, as he claimed himself to be, his Art would suffice him and he would have no care or interest in these humbler advertising insects crawling in the dust below him. If, as his everlasting talk implied, he was truly

convinced that Architecture had the dignity of a Profession, he could never so far demean the pomposity he assumed to his employment as to get violent, and use language unfit for the ears of a full-grown office boy, because a struggling practitioner—a quack, had stolen an advantage of him. One told one's predominant partner that he was angry because he was unsuccessful himself, and because there was no sort of self-advertisement he would not lend himself to if he could reconcile his pride and his ideals to the process. One told him his annoyance was entirely personal pique, and nothing to do with the dignity of the Profession or the truth of the Art. One concluded by explain-

for these outbursts of indignation and irritation were not only transparently sordid, but very undignified. As one concluded, one had retrieved one's hat and was at the door; but, as one fled downstairs upon a matter of business that would take half the day, one was conscious of the wrecking of one's office stool. B. C.

The Genius of Paris.

To lovers of Paris, the work of a man of genius like Meryon must ever appeal very strongly. More accurate drawings there might be, perhaps, and on the

GATE OF JUSTICE: THE ALHAMBRA, GRANADA. FROM A WASH DRAWING BY W. H. SETH-SMITH.

ing to one's predominant partner that it was very easy to have high and aspiring ideals when one was paid well for them, and that he was no better than the average of common humanity in being soured and disgusted because he could not fastidiously follow his own ideals, and live up to his pet principles, and at the same time make a fortune. One reminded one's partner that he was getting on in years, and that the motives and causes

other hand, vaguer impressions; but between these extremes stands the etcher with whom we are here concerned, whose eye was a sailor's eye, and who, when confined to Paris, must have found his vista bounded as it never had been before. But Art without limits of some sort is a thing beyond understanding, and the praise that is given is always for something done, not something vaguely imagined. "Stone walls do not a

prison make, nor iron bars a cage"—the author unconsciously spoke the last word about the nine muses. Let one such as Meryon be "cabin'd, cribb'd, and confin'd" in the city: where we see nothing but bricks and mortar with the smoke and mess pertaining thereto, the artist sees shadow and line. In tone-land between the extremes is the chiaroscuroist's playground. That Meryon was happy enough, at least while he worked, there is proof in nearly all of his etchings, yet his life was one of the saddest. He inherited a taint of disease from his mother, which affected his sight in some way, and blighted his hope of painting, but by virtue of this limitation is he known to the world for his etchings, and as to his subsequent madness, it was something which had to be. It will nearly always be found that the artist inherits his temperament, and if added to that is disease, the combination must prove irresistible. The writer has taken perhaps a rather roundabout way of saying that Mr. Gutekunst's exhibition in King Street is one that should not be missed. There has been nothing so complete of its kind since the year 1879, when the Burlington Fine Arts Club organised its exhibition. In this, although small, there are features especially interesting. Instance: a number of drawings of vessels which help to explain how it was that Meryon's earliest master was Zee-mann, the Dutchman of whose etchings Mr. Gutekunst has some examples. Instance also the wonderful portraits by Bracquemart and Flameng—the former, if mere craft is in question, a more accomplished etcher than Meryon. In support of this opinion, we might be permitted to quote Mr. Hamerton, but space for quotation is not provided. The most celebrated of this artist's etchings are known as the "Paris Set," and concerning their present value the reader should consult Mr. Wedmore, who owns a considerable number, and those in the rarest states. What Meryon thought them to be worth we have no means of knowing, but it has been ascertained that he asked only thirty francs for the set of fifteen. There is solace for the soul even when the claims of the body are pressing in the praise of the few who knew the cost of art work to the worker, and amongst genuine admirers were Baudelaire and Victor Hugo. What was said by the latter will convey more to the reader than any discourse occasioned by the present exhibition. "These etchings are magnificent things. We must not allow this splendid imagination to be wasted in the struggle in which it is engaged with the Infinite while studying Nature or Paris. Strengthen him by all the encouragements possible. The breath of the universe moves in his works, and makes his etchings more than pictures—visions." The etchings to which he refers were completed in 1853, and represent the man at his best. "He translated," says M. Burty, "with that clear view which French genius always claims, the poetry, mysterious and grand, of that old Paris which the children of the Second Empire saw ruthlessly disfigured and destroyed. Under his needle the Architecture, which had hitherto only been rendered by the severe tracings of the architect, or by the summary in water-colours of the decorator, became what a landscape does under the pencil of the master of his Art—namely, a poem. He, as it were, borrowed of the reality only its features; he preserved the characteristic details of the construction, and affixed to them the reflections of his melancholy or the secrets of his enthusiastic mind. Without sensibly modifying the appearance of the building, he invested it with both social and historical connections; as, for instance, in his etching of the building of the Morgue, which, without in reality altering, he drew in the likeness of a tomb.

Thus his work has a two-fold value. It takes its proper place in the portfolios of the collectors of historical documents, and adorns the walls of the studios." It may be remarked, in conclusion, that Meryon anticipated the writer who lately expressed his opinion that things like the Boadicea Monument should be made of some perishable stuff, so that the space they require might be declared vacant in time. M. Burty reports that he spoke of this matter as follows:—"At certain dates every work of Art that is not, without a doubt, worthy of preservation should be destroyed. Of sculpture, mortar should be made by means of an enormous crusher. Of paintings, they should make tarpaulins. The artists should be the first to lend themselves to such a scheme, for whosoever has made a second-rate statue should be enchanted to see it replaced by a better."

E. R.

THE HISTORY OF STAINED GLASS.

FEW arts have had a history as interesting as that of stained glass; and there is probably no other, excepting Architecture, of which it is so necessary to know the past if we would properly appreciate the present. With all the brilliant progress made in special directions in our own age and country, we must still refer for guidance and instruction to the practice of mediæval artists. Quite recently, indeed, it would have been difficult to illustrate the essential principles of the art from modern examples. But, thanks partly to the general advance in taste, still more to the sincere efforts of a few artists, it is possible now, to point to designs which are as logical as those of the Middle Ages, while modern in spirit, and adapted to modern requirements.

THE OLDEST WINDOW GLASS

of which we know belongs to the fourth century A.D. It is thick, uneven, and slightly greenish in colour. Leaded glass of various tones, forming patterns, was used in Roman churches of the ninth century. Step by step other colours were added, and this led to the invention of windows which were veritable mosaics. To these were applied, in the eleventh century, outlines and shadows in black or brown enamel. The artist in stained glass had then at his disposal all the essential means for the production of effective figure work. Curious details of the practice of the ancient workers in stained glass are given in a celebrated treatise by the monk Theophilus. The glazier's diamond was unknown, and a hot iron was used for cutting—or, rather, fracturing—the glass. A temporary kiln was built for each lot of glass to be fired. The old makers had but few colours. Their fine dark blue was at first made with fragments of antique Roman glass vessels. They had copper and iron reds, a good dull yellow, a purple from manganese, and, somewhat later, a green, probably from oxide of chromium. None of these colours were perfectly even, which was an advantage, for each piece of glass had some variety and play of colour. They did not know how to make glass in large sheets, which also was in their favour, for such strong colours should not be used over large spaces.

A GENERAL HARMONIOUS TONE

is to be got in glass, as it is in impressionist painting, by making a mosaic of bright colours in small spaces. In another way their inability to produce large sheets of glass had no less happy effect. It necessitated the multiplication of lead lines. Each piece of glass that enters into the composition of a stained-glass window is held to the other pieces next it by grooved leads, which are soldered together. The smaller the pieces of glass the more numerous the leads, and the network of dark lines thus introduced tended to tone down any garishness of colour there still might be. We may say that ignorance was bliss in the case of the ancient glass stainers. But success is never wholly due to ignorance, and there is abundant evidence that lead lines were mul-

tiplied of choice. Partly, this was in order to give an appearance of construction to the window. It was to form part of an architectural whole, and the designers in this, at least, less ignorant than most moderns, decided to keep their work thoroughly in harmony with its surroundings. Accordingly, most of the mediæval windows are largely filled with glass and lead tracery, following the forms of Gothic Architecture, but in a lighter and freer manner. Arched and gabled canopies, crotched pinnacles, twisted or clustered columns, form a setting for the figures and the diapered or deep blue backgrounds. In our modern work, the necessary harmony between the windows and the building is seldom secured. The permanent window, forming part of the structure, is treated as though it were an easel picture, movable at will. Where any architectural motive is introduced, it is likely to be Gothic if the church be Romanesque, and Byzantine if the church be Gothic. Our

ARCHITECTS ARE SOMEWHAT TO BLAME

for this. They should insist that the windows be regarded as part of the building, and that the designs for them should be in accordance with its style. The Renaissance in the fifteenth and sixteenth centuries greatly affected the art of stained glass. The decorations of churches became mainly mural, and windows were needed that should admit abundant light, and not be themselves more attractive than the pictures. This at first only gave rise to a new and interesting development of painted glass, much of which is very beautiful in its silvery grays and golden yellows and in the elegance of the lead lines, more suitable, however, for private houses than for churches. But the constant improvements, which have ended in the manufacture of absolutely clear and flawless glass in large sheets, together with other causes, finally killed this branch also, and about the end of last century the art was practically extinct. When in the height of the romantic movement of the middle of the nineteenth century, architects and others attempted to revive its glories, they found themselves unexpectedly foiled at every step. The only coloured glass obtainable was thin, ineffective, and without play or modulation of colour.

At a meeting of the School Buildings Committee of the Aberdeen School Board it was decided to instruct the architect, Mr. Mackinnon, to prepare plans forthwith for a new elementary school.

A new organ has been constructed in the Church of SS. Philip and Jacob, Bristol, by Mr. G. Johnson, of Dighton Street, Bristol, and is erected on the latest tubular pneumatic system.

WILLIAM COBBETT'S tomb, near the west door of the fine old abbey church at Farnham, is about to be restored by Mr. John H. Nash, of that town. The portrait carved in relief on the tablet erected to the memory of Cobbett in Farnham parish church was executed by Foley from an original likeness.

EMMANUEL CHURCH, Lockwood, has been reopened, after painting, decorating, and repairs. The work has been carried out by Mr. H. B. Kendall. A new organ, which is in the north-east corner of the nave, has been built by Messrs. Peter Conacher and Co., at a cost of £500.

The foundation-stone has been laid of a church which is being erected about a quarter of a mile distant from the ruins of the Priory of Pluscarden. The Priory was founded by Alexander II., in 1230, and is one of the most beautiful ruins in Scotland. The new church was designed by Messrs. Reid and Willett, and is in keeping with the design of the Priory itself.

MR. MARTIN A. BUCKMASTER, who is art master at Tonbridge School, and art examiner for the Science and Art Department, the Oxford Locals, the Civil Service Commission, and the London County Council, has prepared a text-book on "Elementary Architecture." This is to have thirty-eight full-page illustrations, and it is on the eve of publication by the Clarendon Press.

A PICTURESQUE IRISH SEAPORT.

IN AND ABOUT YOUGHAL.

By H. F. Waring.

II.

THE town of Youghal was formerly surrounded by walls, but owing to the many sieges it has undergone (for the small place seems to have had more than its proper share of troubles), the remains of these are few. It was taken and sacked by the Earl of Desmond in the year 1579, and being regained by Captain White, was in the same year a second time plundered by John Fitzgerald, Seneschal of Immokilly. It was again assailed, but unsuccessfully, in January, 1582. In the civil war of 1641 it was gallantly maintained by the Earl of Cork, who died here whilst shut in by the rebels, 1643. It was again besieged in 1645, but the enemy were finally repulsed. Youghal opened its gates to Oliver Cromwell in 1649, and here the Protector established himself in winter quarters. In the next year he quitted the Irish shores for ever.

So many troubles going on at this period, naturally had the effect of causing the inhabitants to erect strongholds, but the one called after Tynte is the only fortified relic of feudalism now to be seen in Youghal. It was built at the close of the reign of James I. The building measures 39ft. by 23ft. over walls and is about 50ft. high. The walls are still their original height, and are deeply embrasured all round. The doorway at present existing is modern, but doubtless the old entrance stood in the same position, as we may judge from the machicolation overhead on the upper story used for discharging missiles and molten lead on the besiegers. There is an interesting authenticated story in connection with it. In the time of the Rebellion, circa 1643, a number of the English garrison and Protestants of the town who had fled there for refuge, were shut up within its walls. The mayor of the town, named Ronayne, a Roman Catholic, fearing the wrath of the Government if he allowed them to be

THE HOLY WELL, ARDMORE.

killed, despatched a messenger to the officer commanding the garrison at Cork, who sent a troop of cavalry to the relief of the castle. In consequence, the Town Corporation ordered that whenever a "Ronayne" died the town bell should be tolled to keep up the hated memory of the treacherous (!) act of the mayor. This custom still survives, except with the difference that it is now looked upon as an honour. The bell rung is that of the clock tower (illustrated last week) in the south end of the main street, which marks the place of the ancient South Gate. The present clock tower was erected in the seventeenth century, and is executed in red brickwork, with stone facing and quoins used with very good effect. It was, until comparatively recent times, used as a gaol and place of execution.

Though there are many interesting old buildings in Youghal, there was evidently not a new building which had been put up within the last fifty years. This seems to be a fact to be regretted, as it does not speak well for the increasing prosperity of the town, but no doubt it rejoices the heart of the artist, for here he may wander through sleepy old-fashioned alleys, which still have the air of a hundred years ago, and which elsewhere, as time goes on and the jerry and other builders continue to flourish, are rapidly making way

for the "eligible modern villas." May we and they long be spared the change!

Walking southwards, we come to the ferry steps, and board the ferry-boat which plies across the Blackwater. As it happens to be a Sunday we get a sight of typical Irish life. The boat is crowded with country peasants, for the most part old women and comely girls going to Mass, talking hard in Gaelic. These all wear short, coarse, homespun dresses with shoes (on special occasions they *do* cover their feet) that might almost be called "sabots," and as they seem to vie with one another which of them shall wear the brighter head-dress, consisting of a kind of shawl, the effect is picturesque and pleasing in the extreme.

Arrived at the other side, one is able either to walk or get on to that most comfortable of conveyances—the jaunting car, and start in the direction of Ardmore. We soon pass an interesting small Early English church, after which, for about four miles, the road lies through a fairly level country, when we see the Round Tower rising up, and, turning to the right, we enter the small village of Ardmore, which consists of tiny, whitewashed cottages, the appearance of which goes far to refute the bad reputation which the Irish have in the matter of cleanliness and order.

The history of the small place dates back to the early part of the fifth century, for in 402 St. Declan, one of the four primitive preachers of Christianity in Ireland, commenced his mission among the Pagans here. Declan was the son of Ere, chief of a noble family of the Deisi. Such wonderful success attended his labours that the Deisi, forsaking their chief Luban, an obstinate Pagan, followed Declan, who placed them under the headship of Feargall McCormac, one of his own kindred. In 416 a seminary was founded by Declan at Ardmore, from which the light of Christianity radiated into all the surrounding districts, and the retired hamlet became a sanctuary of religion and letters. This school was in connection with a monastic establishment of particular rule, which afterwards was changed into a house of Canons Regular of St. Augustine. In 448 St. Declan was confirmed in the See of Ardmore by the Synod of Cashel which he held this year. He died in 450, and was buried within the little Damphliag, or stone oratory, which in his lifetime had been his primitive cathedral. His grave—or that reputed to be his, is still shown, and is superstitiously revered by the peasantry, who consider the clay taken out of it to be efficacious in the removing of diseases.

Adjoining this Oratory are the remains of a cathedral church, the nave being Romanesque, with a Norman gateway at the north end, and in some Norman arcading. In the east end some most quaint carving is to be seen, representing scenes from the Bible.

Many curious old tombstones are to be seen in the vicinity of this church, the one sketched being in specially good preservation, the figures representing St. Mark, St. Peter and St. Paul, above and on the lower portion, Adam and Eve.

Formerly a monastery stood here, but there

TYNTE'S TOWER.

is no trace of this remaining, except St. Declan's Oratory in which he lived and was buried.

One of the characteristics of the ancient church of Ireland was its asceticism, which it derived from its well-known contact with the Eastern church, where the hermits lived apart in the desert, and hence it is we find so many names of places in Ireland compounded with Desert or Dysert, and to this day, this part of Ardmore is called the desert.

The Holy Well is very curious; it is built with large irregular stones, three of which at the top are carved with a crucifixion. St. Declan used this well as his baptistry, and baptised his converts, the seats on which the candidates sat still being visible.

So great is the faith of the peasants in this

TOMBSTONE IN THE GRAVEYARD, ARDMORE.

Saint, that during a certain fortnight in every year, thousands of them (even in this age of scepticism) with all manner of diseases and sores, flock to the well, where they go through certain ceremonies, consisting of praying, walking round the well, kissing the cross and counting their beads, after which they bathe themselves in a small stream running from the well, and finish by drinking a glass of the water.

The Round Tower of Ardmore, adjoining the site of the cathedral, dates, as probably do the others of Ireland, from the 7th or 8th centuries; all are no doubt of Christian origin. Professor Stokes, of Trinity College, Dublin, traces these round towers from Syria, thence to Constantinople, then from the Iconoclastic period of the Leos to Ravenna and thence to France and Ireland. They all in Ireland have the same peculiarities—the same height and conically shaped top, a door 15ft. from the ground, circular from the base, tapering in a perfect circle to five or six stones, with windows to the cardinal points. The tower at Ardmore shares with one other only in Ireland the peculiarity of string courses on the outside, which, however, do not mark the stories. The towers are invariably found near old churches, and sometimes with the building itself. They were used first as bell towers and keeps in times of danger for the property of the clergy and church, and also as beacons. The one in this instance is kept in repair by the Board of Trade for purposes of a landmark.

ACCORDING to present arrangements, the Art Gallery of the Corporation of the City of London at Guildhall will be reopened to the public by the Lord Mayor and Sheriffs on June 4th, with a new collection of pictures by French masters of the nineteenth century, which has been loaned almost exclusively by private French collectors.

THE GATES OF LONDON.

"THE City wall is great and high," wrote Fitzstephen in the reign of Henry II., "with seven double gates, with towers on the north at proper differences." Hidden away here and there in cellars of City warehouses portions of this great and high wall may yet be inspected; but of the seven great gates not one remains. Perhaps from a utilitarian point of view this is well, for they would have been sore hindrances to the busy streams of traffic in these *fin de siècle* days. Possibly one of the oldest was Aldgate, the earliest mention of which occurs in a charter granted by King Edgar to the Knighton Guild about the year 967. It was doubtless originally one of the four gates by which

THE ROMAN WAYS ENTERED

the ancient Londinium. Its name is supposed to have been derived from the Saxons, who called it Ald or Eald (old), on account of its ruinous condition; but in records dating from 1325 to 1381 it appears as Alegate or Algate. When the Barons rose in arms against John they entered London by this gate, which was then in a dilapidated condition, and shortly afterwards they rebuilt it. It was in the house over the gate that Geoffrey Chaucer, the author of the "Canterbury Tales," lived for many years. In 1606 the old gate was pulled down, and a new one erected during the three following years. According to Maitland, this was an ornate structure, garnished with a gilt vane and effigies of Roman soldiers on the battlements, while beneath, in a "large square," stood a statue of James I. in gilt armour, with a golden lion and unicorn; this was on the east side. On the west face stood

A STATUE OF FORTUNE

with the King's arms below, and the motto, "Dieu et mon droit—Vivat Rex." Figures of Peace, with a dove, and Charity adorned the north and south sides, and over the arch was engraved, "Senatus populusque Londiniensis. Fecit 1609. Humfrey Weld Maior." The gate, which stood in the High Street, south of Aldgate Church, was taken down in 1761. The next gate on the wall was Bishopsgate, erected in or about 675 by Erkenwald, Bishop of London, who was a son of Offa, King of Mercia. This gate is said to have taken its name from the effigies of two bishops, one of which was the founder, the other a Norman prelate, who probably restored the gate during the reign of the Conqueror. In consequence of the Bishop of London receiving a toll of one stick from every cartload of wood passing through the gate he was bound to provide the hinges and keep them in repair. The gate was rebuilt in 1471 by the Hanse merchants, who were exempted in 1305 from the toll of 2s. which had been levied on all goods passing

in or out, in consideration of which they undertook to maintain the structure. In 1731 this gate was demolished, and, says the Evening Standard in an article on the subject, a plainer building erected in its place, which was removed in 1760 for street improvements. Moorgate was a postern made in the old wall by Thomas Falconer, the Mayor, in 1415, to enable the citizens to reach their gardens and neighbouring fields by a shorter route than hitherto. Its proximity to the moor was the origin of its name. It was rebuilt in 1647, and in 1761 was described as one of the

MOST MAGNIFICENT

in the City. It was a loftier structure than usual, to allow, it has been supposed, the trained bands to march through with pikes

THE ROUND TOWER, ARDMORE.

erect, but probably the real motive was the admission of wagons loaded with hay or other commodities. In 1762 the gate was pulled down, and the stones were used to strengthen the central pier of London Bridge. Cripple-gate was thought by Maitland to be one of the four original gates erected over the Roman ways which entered the City. It was rebuilt by the Brewers' Company in 1244, and in Edward I.'s reign was a prison for debtors. This gate was again rebuilt in 1491 by a legacy left by Edmund Shaw, a goldsmith, who was Mayor of London in 1483. It was repaired and "beautified" in 1665, and finally

THE HOLY WELL, ARDMORE.

demolished about a hundred years later. The name is said to have originated from the number of cripples who begged there; while "rare" Ben Johnson, in his play, "Every Man out of His Humour," says, "As lame as Vulcan or the founder of Cripple-gate." As the gate stood at the entrance to the covered way to the Barbican, it is considered probable that its name was derived from the Saxon "crepel," a den or passage underground. Of Aldersgate, which stood near the Church of St. Botolph, old Stow, the antiquary, says: "Eluresgate, or Aldersgate, so called not of Aldrich or Elders—that is to say, ancient men, builders thereof; not of Eldarne trees growing there more abundantly than in other places, as some have fabled; but for the very antiquity of the gate itself, being one of the first four gates of the City." Maitland, however, does not share in this view of its antiquity, and by others it is supposed to owe its name to one Aldrich, a Saxon. In a charter dated 1243 it is called Aldrichesgate. During the reign of Elizabeth the gate and the rooms over it were enlarged and improved by John Daye, a celebrated printer, who published one of the earliest English almanacs there in 1550, and who had for a lodger in 1567 Fox, the author of the world-known "Book of Martyrs." The gate was rebuilt in 1616. A statue of James I. on horseback, with the arms of England, Scotland, and Ireland above his head, adorned the facade of the gate; while another effigy of the monarch, seated and wearing the robes of State, graced the south front, and on the east and west sides were figures of Jeremiah and Samuel. The gate was much

INJURED DURING THE GREAT FIRE, and was repaired at the City's expense in 1670. Pepys, the celebrated diarist, under the date October 20, 1660, remarks: "I saw the limbs of some of our new traitors set upon Aldersgate, which was a sad sight to see." The structure was sold by auction in 1761, and shortly afterwards was removed. Across Newgate Street, a little to the east of Giltspur Street and the Old Bailey, stood Newgate, erected in the reign of Henry I. According to Maitland, it was appropriated for a common gaol for felons in 1218, but it is mentioned as a prison in records dating back to 1188. The same authority states that it was repaired in 1420 and again in 1630. The gate appears to have been rebuilt by Sir Richard Whittington and to have been repaired in 1556 after a fire caused by the carelessness of the "keeper's mayde" which proved less destructive than the Great Fire more than a century later. It was rebuilt in the year 1672, and finally taken down in 1767. The last of the great City gates was Ludgate, which was built, according to Geoffrey of Monmouth, by that mythical personage King Lud, who is said to have flourished in 66 B.C. But taking into consideration its proximity to the Fleet river, it is most probable that its name was a corruption of the Saxon "flod," a small navigable river. This was one of the gates by which the Barons entered London during

THEIR WAR WITH JOHN, and finding it and the adjoining wall in a dilapidated condition they pulled down the houses of those Jews who were living in its neighbourhood to repair both the wall and the gate. In 1373 the gate was made into a free prison for poor debtors and freemen of the City, and was enlarged by Sir Stephen Forster, Mayor, who was himself once a poor prisoner. In 1419 Ludgate was "ordained as a prison for citizens and reputable persons," and Ben Jonson, in the plays previously quoted, says, "Beware you commerce not with bankrupts and Ludgathians." The gate was rebuilt in 1586, and adorned with statues of Queen Elizabeth on the west side and of King Lud and his two sons on the east. It was seriously injured in the Great Fire, was repaired or rebuilt, and was finally removed in 1760—a record year in the destruction of these old City gates. The structure known as Temple Bar was not, properly speaking, a gate. It was originally, as its name implies, a bar or chain erected at the end of Fleet Street by the Knight Templars to mark the boundary of the City control without its walls.

NEWSTEAD ABBEY.

By A PILGRIM.

THE genius of Childe Harold has rendered Newstead radiant for all time. You might as well think of Stratford-on-Avon without Shakespeare as Newstead without Byron. The Abbey, says a writer in the Sheffield Telegraph, is not a great show place like Chatsworth or Welbeck, but it may always be inspected on two days of the week. After leaving Newstead Station it is the proverbial stone's throw to the first Lodge gate. It gives access to a long avenue leading to the second Lodge. This gained, the visitor is transported into a world of rural life and rustic character. Presently comes in sight a low castellated ivy-grown building with a clock-tower. It is only the Abbey stables. They stand on the margin of a beautiful lake. A moment more, and now, lo! and behold! the real Newstead, flanked at one extremity by the great square tower, and at the other by the remains of

THE OLD ABBEY CHURCH.

The tracery of the great west window has disappeared, but the beautiful doorways remain intact. The Abbey is at once a picture-gallery and a museum. The Grand Saloon is hung with paintings by Vandyck, Kneller, and Lely. The eye dwells on Phillip's famous portrait of Lord Byron—the Lara-like peer—made familiar to us by many engravings. Among the *chefs d'œuvre* of this stately apartment may be mentioned a precious Etruscan vase, a table from an old Italian palace, with its top marvellously jewelled with precious stones; a chair that belonged to Warren Hastings, and the case in which once reposed the skull drinking cup used by Byron and his Bacchanial companions when masquerading at midnight in the Abbey as monks.

THE GREAT DINING HALL,

the refectory of the ancient Abbey, is a room of distinction. The Past and Present here shake hands, for from bosses of the fine old oak ceiling peep out the lamps of the electric light. One end of this room is occupied by a minstrels' gallery, after the manner of the musicians' balcony in the banqueting hall at Haddon. The walls are so diversified with old armour, helmets, cuirasses, military colours, flags, and banners (taken from the field of Waterloo, on which Colonel Wildman fought, and which inspired Byron with the finest lines in "Childe Harold's Pilgrimage") that the *tout ensemble* reminds one of the relics of the warlike past at Abbotsford, a collection which more than one writer has said, as a whole, leaves an impression on the mind of the visitor that there must have been a good deal of personal sympathy mixed up with the playful satire with which the inimitable character of the "Antiquary" is treated. Newstead is

A TREASURE-HOUSE OF ART.

But more beautiful than the pictures on the walls are those framed by the windows; vignettes these of wood and water, lawn and lea, that come as a revelation to the street-stricken citizen; landscapes that the artist who works in oil colours finds it passing hard to realise—light, air, liquidness, distance, the rapture of repose, and the lovely loveliness and dreamy quiet of Nature. One cannot help thinking that the Abbey and its surroundings must have exercised a good influence over Lord Byron's unhappy life, and added brighter hues now and then to his inspiration. The Byron rooms remain almost as the poet left them. Here is the very bed upon which he tossed through the feverish vigils of many a weary night—a substantial four-poster, with heavy curtains and a dome-shaped top, the corners surmounted by coronets; here is the chest of drawers which held his "portable property;" here is his washstand, with its quaint blue China bowls. A small chamber next Lord Byron's bedroom, formerly the infirmary for invalid monks, and which had the grisly reputation of being haunted, the poet had fitted up for his page. After inspecting the Byron rooms, we visit the cloisters, and the chapter-house, now used as a private chapel.

CARDIFF CHURCH.

THE SCHEME OF RESTORATION COMPLETED.

THE work of restoring the Parish Church at Cardiff began about nine years ago. It has now been completed. Nearly £20,000 has been expended upon the edifice. The work has been carried out with Mr. C. B. Fowler as architect—an appointment made by the Corporation at the wish of the Vestry. The contractors for the walling and coping, the cementing of the paths, etc., were Messrs. Turner and Sons, of Cardiff, and the wrought iron railing is the work of Messrs. Letheren and Son, of Cheltenham. The alterations in and around the churchyard have cost as near as possible £1500. The areas in the graveyard have been turfed, and at the express desire of Lord Bute gravel paths have been made round the church. It was found necessary in the cause of carrying on the work to disturb a large number of the graves, the contents of which were carefully taken and reinterred in the New Cemetery, with the headstones above them. An object of great interest in the churchyard has been the old fifteenth century cross. This was excavated, but it was found that all the steps were missing, only the rubble foundation of the cross remaining. It was accordingly decided to restore the cross, and the work has been carried out in the best Portland stone by Mr. Clarke, of Llandaff, from designs and under the superintendence of Mr. C. B. Fowler. It is now to be regarded as a memorial of the restoration of the whole of the church tower and graveyard. The head of the Cross represents the Crucifixion and the Ascension, surmounted with a canopy with crocketed pinnacles in harmony with those upon the tower. The base of the tower has also been restored in its erstwhile octagonal shaped steps leading up to the base of the shaft of the cross. It is interesting to note that in the course of generations the level of the churchyard has risen some 3ft., the base of the steps leading to the cross representing the original level. From an architectural point of view, Cardiff Parish Church is one of great beauty—a venerable pile, the neglect of which would have been at once a disgrace and a scandal to a professedly intelligent and cultured community.

A new Primitive Methodist chapel is being erected at Wellington at a cost of £1900.

A school and parochial hall has been erected at Egremont, Liverpool.

New Sunday Schools have been erected in connection with the Lindfield Congregational Church.

Two new stores have been erected, at a cost of over £1000 each, by the Batley Co-operative Society. The shops are respectively situate at Mount Pleasant and Carlinghow.

The Queen has become the possessor of Mr. Holman Hunt's picture "The Beloved," which is at present in the New Gallery. It will be removed to Windsor at the end of June.

The Nottingham Tabernacle has been reopened. The building has been thoroughly cleaned and the appearance considerably enhanced by extensive decorations.

The Newcastle Council propose to widen Corporation Street to the top of Westgate Road, to make a new street crossing from Pilgrim Street, in a line with Market Street, to Picta Place, and to widen Byker Bridge.

MR. HARRISON HAYTER, past president of the Institution of Civil Engineers, died recently at his residence, 61, Addison Road, Kensington, W., at the age of seventy-three. He was one of the most prominent civil engineers in this country.

ONE of the two marble busts of the late Sir John Pender, G.C.M.G., executed by Mr. E. Onslow Ford, has now been received by the authorities of University College, London. The bust has been placed in the library. The likeness is a pleasing and striking one. The second bust is at present on view at the New Gallery.

A NEW WORKHOUSE AT NOTTINGHAM.

EXTENSIVE BUILDINGS PROJECTED.

A NEW workhouse is about to be erected at Nottingham. The accepted plans show the building as one of the largest of its kind in the country. The site comprises 67½ acres; it was purchased at a cost of £12,900. The Board of Guardians advertised for competitive drawings for the accommodation of 1500 people, and the necessary offices, &c. The competition was limited to Nottingham firms and six London firms. Of the latter only one competed. Mr. W. H. Ward, of Birmingham, was appointed assessor, and he selected the plans of Messrs. Marshall and Turner, of King Street, Nottingham, as the most suitable for the purpose, awarding the second place to Messrs. Brewill and Baily (Nottingham), and the third to Messrs. R. C. Sutton and Son (Nottingham). Tenders were received for the preparing for and putting in of the foundations, and Messrs. Hodson and Son, of Nottingham, were appointed the contractors. Arrangements are being pushed forward for the letting of the contract for the superstructure. The total estimated cost of the new workhouse, exclusive of the land and of furnishing, is about £250,000. When completed, the building will be one of the most conveniently arranged and extensive institutions of its kind in the country. The main building, or workhouse proper, is to be arranged to provide for the admission of 612, accommodation being apportioned for 120 able-bodied inmates, 100 infirm, 380 persons of both sexes, and for twelve married couples. This part is represented in the lower range of buildings, the administrative block being arranged between, with kitchens, food and general storerooms, large dining hall, offices, committee-rooms, and apartments for the master, matron, and servants. The infirmary is noticeable as the extensive range of premises to be constructed at the higher portion of the site. Here provision will be made for 560 patients. In this case also the administrative block forms a division for the buildings inhabited by male and female inmates respectively, kitchen and store accommodation upon a liberal scale being included in addition to distinct quarters for dispensary, operations, medical offices, committee rooms, and separate apartments arranged for the storekeepers and steward. A small isolation hospital will occupy the extreme top left-hand corner of the side, the building including a children's infirmary for thirty, a nurse's home capable of accommodating forty-five, and a separate block of premises for the reception of mothers with infants. The engine and boiler-house occupies a central position immediately between the workhouse and infirmary, and on either side are buildings representing the workhouse and infirmary laundries respectively. Workshops, stables, the labour master's house, a mortuary, and remand boys' quarters are directly behind the workhouse. A large block of buildings at the extreme right of the site provides for the reception of 216 imbeciles, and in proximity to the entrance are the porter's lodge, receiving wards for nine, and vagrant wards for sixty-eight, together with stone breaking yards and sheds. The chapel is placed on the knoll commanding the whole site. The total accommodation in the entire building represents provision for 1614, exclusive of members of the staff.

A MEETING of members of the congregation of Oldbury Parish Church has decided to proceed with the renovation of the church at once, and appointed a committee to confer with Mr. Wood, architect, and obtain some idea of the cost of the repairs.

It is proposed that the appearance of Aberdeen should be enhanced by the formation of a boulevard extending from Holburn Street westwards by Rubislaw, passing over Stockert Roads in the north-west, and terminating at Kittybrewster, in the northern district of the city.

STEEL CONSTRUCTION IN ARCHITECTURE.

AMERICAN AND ENGLISH METHODS.

IN an interesting article dealing with steel construction, Mr. Charles V. Childs remarks—in the Engineering Magazine—that the architects of the different countries being obliged to keep within the limits of their respective building laws, the restrictions imposed on them naturally affect not only the visible appearance of the building, but also its internal structure. While it is highly probable that but few London buildings would come up to the standard prescribed by the New York building laws—i.e., inside the so-called fire limits of New York—on the other hand, it is certain that the London County Council would never permit the erection of the steel constructed "skyscraper" within the area under its control. As an instance, in proof of the former statement, it is necessary only to notice how many of the front walls of London shops are carried on bressummers resting on exposed cast-iron columns. The New York building laws provide that all cast-iron columns supporting outside walls shall be incased in an outer cast-iron shell with an intervening air space, the internal column being sufficiently strong to carry the load.

EVIL OF THE "SKYSCRAPER."

It is appalling to think what the streets of London, already in so congested a condition, would be like, were it permissible to erect buildings fifteen or twenty stories high. The burning question of New York has long been to provide sufficient rapid transit to and from the business centre of the city; and, while the solution is yet far off, the continued erection of high office buildings is making matters worse by concentrating business offices within comparatively narrow limits. The excessive height of the American buildings has necessitated the use of the steel skeleton construction, in order to economise the weight, and consequently the thickness of the walls in the lower stories, which otherwise would occupy valuable space, to say nothing of the cost of material and labour. The usual thickness of the walls, which, from the nature of the construction, serve only as a covering, is from 13½ in. to 18 in. In England the thickness of wall at the ground-floor level rarely has to exceed 2 ft. 3 in.; if, however, instead of being five or six stories, the buildings were to be three or four times that height, the increase in thickness would have to be enormous, and the steel skeleton framework would probably come into general use. The steel construction, therefore, has to adapt itself to the style of building prevailing in the different countries. The essential difference, broadly speaking, is that, whereas in American construction each story is

SUPPORTED ENTIRELY BY GIRDERS

at the floor-level of the story, and the weight directly transmitted to the foundations by means of the steel columns (Anglice stanchions), the usual English practice is to place all necessary bressummers at the level of the first floor; these, therefore, having to carry the whole weight of the building above this level, are necessarily heavy compound or plate girders. Certain of the American features might be introduced into the English buildings with advantage; the difficulty of doing so lies in the fact that the architect's plans are practically complete before the engineer's work begins. . . . The steel work in an American building begins a few inches above the foundations, and consists of layers of steel beams, embedded in concrete, to form the piers, on which the steel bases of the columns rest. The bottom layer is so designed that the load is distributed to the ground at an allowable pressure of two or three tons per square foot pressure; this being the same for all piers, any settlement would be uniform throughout the building. In the next layer the beams rest on those below, at angles to them, and their length is equal to the breadth of the lower layer. The ends of the beams of each successive layer

project, and act as cantilevers, their sizes being determined by the intensity of pressure on their cantilever ends. Anchor rods are embedded in the concrete, and bolt the column bases to the flanges of the uppermost layer. By this method the height of the pier is considerably lessened, effecting a saving in excavation and concrete. The tops of the piers are kept just below the basement floor-level, in order to economise room. The English architect depends on concrete alone for his foundations, and, where buildings have been pulled down, utilises the old bricks for this purpose.

PIERS AND STANCHIONS.

In America the space under the sidewalks, being the property of the owner of the adjoining building, is part of the basement floor. The outside walls are carried on lintels just below the side-walk level! As each floor is carried on girders independently of the other floors, these lintels have to support only the weight of the ground-floor walls and probably a portion of the ground-floor load. Where the columns carry party walls, it frequently happens that there is not sufficient space inside the building line to allow the column bases to rest fairly on the piers; in such cases the piers are built inside the party line, and the bases of the columns rest on strong cantilever girders bearing on the piers, the other ends of the girders being either counterbalanced by the internal columns or anchored down to a mass of concrete. In English buildings, on the other hand, the stanchions carrying bressummers usually rest on blue brick piers, built up to within a foot of the ground-floor level, and the bases of the stanchions are bolted to York stone plinths. Frequently a sheet of lead is laid between the steel base and the stone. Mention is made of this, because experiments have shown that the practice is harmful; the crushing strength of the stone is thereby diminished, the supposition being that the lead flows into any unevenness in the stone, and acts as a wedge. The columns in American practice are two stories in height, and the connections are made to break joint alternately at each floor. All connections of columns to columns, girders to columns, and cross-joints to girders are riveted, the riveting gang following after the erection gang, and carefully plumbing each column before riveting it to the one below. The steel skeleton is thus as much a structure in itself as in the case of a bridge.

FIREPROOFING.

In regard to the methods of fireproofing: stone, brick, and steel are not, strictly speaking, fireproof; and, until English architects fully realise this fact, and introduce proper fire-resisting material, no building in England will be worthy of the name "fireproof." In America all girders and joists are carefully encased in tiles made of fireclay, with an air space, to act as a non-conductor of heat, between the tiles and the steel work. Moreover, the partitions between the rooms and the furring inside the brick walls are of firebrick. The firebrick contract is naturally an expensive item, the estimate for the Carnegie Building amounting to 50,000 dollars for this portion of the work. English fireproofing may withstand a small fire originating inside the building, but is entirely inadequate to resist a large body of heat, such as may be caused by the conflagration of neighbouring buildings, or the combustion of inflammable material stored within the building.

THE Dewsbury and District Technical School governors have accepted a scheme for extending the building at an estimated cost of £5,000, Mr. J. L. Fox to be the architect.

OWSTON CHURCH, near Doncaster, has been reopened after the restoration of the fine old Norman tower, which was in an unsafe condition. The cost has been over £600.

THE foundation stone has been laid of the new Roman Catholic Church of SS. Peter and Paul, at Ilford. The new building is of a plain character, and is only regarded as a temporary church. The church was built at the total cost of £2000.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
May 25th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

The design of Mr. R. Burns Dick, architect, 55, Northumberland Street, Newcastle, has been selected, in open competition, for the proposed new police-court and lock-up at Berwick-upon-Tweed. There were thirty-seven competitors, and the assessor was Mr. J. Cresswell, County Architect. The buildings on the ground floor will consist of a police-station with seven cells and a house for resident constable; and, on the upper floor, of police-court, with magistrates', witnesses, and other rooms. The estimated cost is about £5000. The plans of Mr. Charles Fred. Short, London, were placed second.

The Athens correspondent of the Standard states that Mr. Penrose, the well-known English architect and archaeologist, who recently arrived there at the invitation of the Government, has attended before the Council of Ministers and given evidence regarding the endangered condition of the Parthenon, and advised that certain works should be undertaken. He demonstrated the serious risks to which the signs of the crumbling state of the structure point, and the probable fall of the western vestibule. Mr. Penrose expressed the conviction that the monument may yet be preserved for several centuries, thanks to the works of consolidation already carried out and to be continued according to his suggestions. The work already done by the Greek Committee has been approved by Mr. Penrose.

The officers of the Architectural Association for the session 1898-99 will be as follows:—President—Mr. G. H. Fellowes-Prynn; Vice-Presidents—Mr. P. J. Marvin and Mr. A. S. Flower; Committee—Messrs. T. W. Aldwinckle, jun., R. S. Balfour, H. B. Creswell, B. F. Fletcher, M. Garbutt, A. H. Hart, Beresford Pite, W. A. Pite, H. A. Satchell, and W. H. Seth-Smith; Hon. Treasurer—Mr. Hampden W. Pratt; Hon. Librarian—Mr. C. H. Freeman; Hon. Secretaries—Mr. E. Howley Sim and Mr. G. B. Carvill. Other officers:—Hon. Solicitor—Mr. W. H. Jamieson; Hon. Assistant Librarian—Mr. E. W. M. Wonnacott; Hon. Auditors—Mr. H. P. G. Maule and Mr. J. W. Stonhold; Assistant Secretary and Registrar—Mr. D. G. Driver.—The annual dinner takes place to-morrow (Thursday) at the Holborn Restaurant.

It is stated that Sir John Millais' portrait of Mr. Gladstone is to be hung in the National Gallery. There is one, if not two, portraits of the great statesman in the National Portrait Gallery, and it is fitting that this one, which

has an historical value, and is one of the finest examples of the works of our greatest modern master, should have a place in a gallery of masterpieces. There will then be two of Sir John Millais' paintings in the National Gallery. It is also stated that Millais' "The Order of Release," which was sold for so large a sum the other day, was purchased by Sir Henry Tate, who proposes to place it in the Gallery which bears his name.

MESSRS. CHRISTIE, MANSON, AND WOODS recently sold the valuable collection of objects of art and decorative furniture of the late Mr. Robert Rankin, of Liverpool. The 157 lots brought a total of £3402, the articles in blue and white china and old Sèvres porcelain in particular selling exceptionally well. The principal lots included: A miniature portrait of Queen Elizabeth, in richly jewelled dress and white ruff, by I. Oliver, 44 guineas; a pair of Chelsea plates, gold anchor mark, 38 guineas; a large Chelsea cup and saucer, 40 guineas; a Dresden group of lady and gentleman, dancing, 50 guineas; old Sèvres, a pair of circular dishes, 55 guineas; a verriere, dark blue, 115 guineas; and an oviform vase, 44 guineas. Old Chinese porcelain, a pair of egg-shell deep plates, 50 guineas; and a deep plate, enamelled with a lady and two children, 41 guineas. Old Nanking porcelain, an oviform jar, 31 guineas; a pair of beakers, 6½ in. high, 62 guineas; a pair of triple gourd-shaped bottles, 48 guineas; a cylindrical jar and cover, 40 guineas; a pair of the same, £115; a pair of oviform vases and covers, 58 guineas; and a pair of cylindrical bottles, £230. Decorative objects, a pair of candlesticks, formed of vases of old Sèvres porcelain, 70 guineas; a pair of candelabra, 62 guineas; a Sheraton secretary of mahogany and satinwood, inlaid, 100 guineas.

In an address recently at the galleries of the Royal Society of British Artists, Suffolk Street, the Bishop of Bristol spoke of the pictorial artist as the man who cured the imperfections of our vision. The appreciation of beautiful things was often a growth. There was a time when he laughed at the notion of collecting old china and old furniture. Now he was alive to the beauties of teacups, and spent much time admiring Chippendale chairs. A good picture of a church interior was not merely the representation of a building. It compelled lofty emotions, and as you looked at the canvas you could hear the angels singing. At the conclusion of the address Sir Wyke Bayliss said his lordship had revealed so much of the feeling of an artist that it was sad to remember he was only a bishop.

RICHMOND HILL is again in danger. The Hon. Secretary of the Preservation Committee writes as follows:—"A scheme is on foot for the construction of a railway actually over the Hill. The proposed line is no mere tramway, but a standard gauge railway for the conveyance both of goods and passengers, applied for under the powers of that most loosely framed enactment, the Light Railways Act of 1896, and intended to pass along the public highway called the Queen's Road, past the Star and Garter Hotel and Richmond Park gates, down Petersham Hill, through the lovely spot known as Petersham Common, and the pleasant village of Petersham, through 'umbrageous Ham,' and so to Kingston and Hampton Court. The proposed mode of traction is electricity, conveyed by cables suspended on hideous overhead standards from a generating station somewhere on the Middlesex side of the river. The line is one for which there is no public requirement whatever, and is designed merely in the interests of the promoters, and possibly of the Hampton Court tripper, and I appeal to every admirer of the beauties of Richmond Hill to record his protest against such a desecration of the place. It is only within the last few weeks that the protests of public opinion have rescued the beautiful scenery of Henley Reach from the disfigurements threatened by one of the great railway companies. May I hope that the same public opinion will now come to the rescue of that equally lovely spot, Richmond Hill?"

THE public mind in Birmingham is a good deal exercised as to the future of the Christ Church site. At present it is understood the Colmore trustees, who purchased the site, have not decided upon any use to which it is to be put. It is, however, true that a sketch plan has been prepared by Messrs. Hennan and Cooper for a block of commercial buildings, the central feature of which is an exchange hall, with a lofty tower, looking towards Paradise Street. The difficulties, incidental to the site, have been overcome in the architects' design by placing the Exchange Hall on the level of Waterloo Street, and so obtaining a lower ground level for shops facing and in the level of New Street, and by the formation of an arcade on the remaining three sides, by which no fewer than thirty shops in all are secured. In addition to this the upper stages of the building are generally set back some 12ft. from the frontage lines, which will improve the lighting all round, and provide a substantial horizontal base for the imposing building above. The Colmore trustees, as indicated, have not yet had any scheme submitted for their consideration, but it is probable that matters will take some definite shape within the next few weeks.

THE memorial window to be placed in Crathie Church by the Queen's tenants and servants on the Balmoral estate in commemoration of the sixtieth year of Her Majesty's reign is being designed and constructed in London. It is to be placed in the north transept, and will be of the same size and architectural design as the window in the south transept—three small Gothic arches, the centre arch predominating. A figure representing King David will be the central feature, and there will be subsidiary figures at the sides, with appropriate texts.

THE documents with regard to the competition for designs and plans for the new workhouse, at New Cross, Wednesfield, have been issued by the Workhouse Committee of the Wolverhampton Board of Guardians. It has been decided not to have an open competition for the appointment of architect, but that the competition shall be limited to three architects, to be selected by the Guardians, who are recommended to select Messrs. Magnall and Littlewoods (of Manchester), Mr. W. Doubleday (of Birmingham), and Messrs. Marshall and Turner (of Nottingham), to compete, on the terms that the author or authors of the designs and plans selected by the Guardians have the appointment of architect at the usual fee of 5 per cent. upon the outlay authorised by the Guardians, to include all fees and extras, and that each of the other two competing architects be paid a sum of £100 for their fees and expenses. The designs are to be delivered by the 1st July next.

THE three historical paintings which for some time past have been hanging in Committee Room 10 at the House of Commons are to be reported upon by Professor A. H. Church, F.R.S., who has just completed the restoration of all the beautiful frescoes in various parts of the Palace of Westminster, and their ultimate destination will probably be one of the Government Offices. The only difficulty in regard to their disposition has arisen in the case of Mr. Watts's enormous canvas representing Alfred inciting the Britons to resist the Danes, which covers nearly the whole of one side of the room. The other two—Cross's "Pardon of Bertrand by Richard Cœur de Lion" and Pickergill's "Burial of Harold"—are very much smaller. All of them were executed half a century ago at the request of the Fine Arts Commission, and were originally placed in the members' old smoking-room.

THE Edinburgh Rustic Art Club held their twenty-first anniversary dinner recently. Mr. W. Drummond Young presided, and proposed the toast of "The Royal Scottish Academy," which was acknowledged by Mr. W. D. Mackay, R.S.A.—Mr. A. Roche, A.R.S.A., proposed "The Rustic Art Club." He congratulated the Club on its present position, and said that he could not imagine broader and simpler principles than

those on which it was founded—every member of it getting the same chance, and every man sharing the responsibility. The Club was certainly remarkable, because an amateur club of the kind which had gone on for twenty-one years, and had carried out its object so thoroughly, was phenomenal. The members did not get any initials after their names or any meretricious acknowledgments, so that they must have been very genuinely in love with Art and with its advancement. His belief was that a Club which had accomplished such first-class work in the past, and which was founded on so sound a basis, would continue on the same flourishing lines in the future.—Mr. J. Coutts responded to the toast.

THE finishing touches have just been given to the restoration of Lady Stair's house in the Lawnmarket, Edinburgh, the work having been superintended by Mr. G. S. Aitken, architect, 49, Queen Street, Edinburgh, by the direction of Lord Rosebery. The house, as restored, cannot fail to be one of the most interesting landmarks of old Edinburgh, and one which every visitor to the old town will wish to see. It stands in an alley in Lady Stair's Close, midway between the Lawnmarket and the Mound, and the only thing to be regretted is that it is hidden entirely from anyone passing up and down to the Castle, or from the George IV. Bridge to Princes Street. It was built by Sir William Gray, of Pittendrum, and the initials of the original proprietor and his wife figure on a sculptured stone over the doorway along with a small coat armorial, with the initials W. G. and G. S., and the date 1622, with the motto, "Fear the Lord and depart from evil." This same legend has been repeated on one of the panels in the large hall inside, along with another over the main fireplace, "Blissit be God for all His gifts." A special feature are the richly-carved wooden mantelpieces, from which the paint and white-wash has been scraped.

LORD ROSEBERY must be complimented on his patriotism and good taste in rescuing such a building from inevitable decay and common uses, and preserving it as a relic of an early seventeenth-century building in the old town of Edinburgh. Mr. Aitken, the architect, has bestowed an enormous amount of care on the restoration and the decorations of the roof and cornices in the main hall, which are done in gold and colour by Bonnor. The arms of the family of Primrose, Stair, Rothschild, are in evidence, and an inscription is there as to the restoration by Lord Rosebery in the jubilee year of 1897. Emblematic designs on the roof of the ceiling stand for music, religion, printing, publishing, and astrology. Portraits are there of George Buchanan, John Knox, Sir Walter Scott, and Robert Adam, the architect. The printers and publishers are also memorialised. The name of Myllar, the printer, whose book-plate was a windmill and a miller with a sack of flour, is memorialised, as also Nelson, and there is a picture of the teneament in the Lawnmarket where he commenced business; the names of Lekprevik, Creech, Constable, and Chambers are also in evidence. The chandelier is from an original design by Mr. Aitken, and is in ironwork made at Frome. The bedrooms and kitchen have also been thoroughly restored, so that there is nothing to prevent the house from being a comfortable and commodious residence save its position and rather sordid surroundings.

FIRE has completely destroyed Rendlesham Hall, Suffolk. The outbreak occurred in the roof above the kitchen, and spread with great rapidity from end to end of the building. The house was of modern construction, with iron girders and concrete floors between each story, and was believed to be fireproof. The burning material from the top, however, broke through into all the floors below, and every room in the house was eventually burnt out.

SOME well-known artists are represented in the modest little exhibition of cabinet pictures, sculptures, and stained glass which the Surrey Art Club have brought together this year at

the Clifford Gallery in the Haymarket. The show, although extremely interesting, is quite conventional. No note of eccentricity is sounded such as might proclaim the inception of a new "school." The accident of residence, not the affinity of artistic aim, seems to be the sole bond of union recognised by members. Curiously enough the county from which the club takes its name, rich as it is in distinctive and tempting landscapes, finds little honour on the walls of the exhibition. The skies and Architecture of Italy, the drives of Schierknin-gen, the mountain and flood of the Welsh and Highland hills, the usual variety of anecdotal subjects—these apparently are the favourite material of this as of other organisations of artists. Yet Surrey is not altogether neglected. Its far-extending downs and mellow harmonies of colour are worthily commemorated by Mr. F. A. Oldaker, Mr. John Gray, Mr. G. E. Grace, and Mr. Claude Hayes.

VARIOUS hints have recently appeared in regard to the proposed purchase by the Prince of Wales of a seaside residence in the neighbourhood of Cromer. It is now stated that Felbrigg Hall, a pretty old Elizabethan mansion about three miles out of Cromer, will probably be acquired by the Prince as an easily accessible seaside resort for his family. There are about a couple of hundred acres of land with the Hall, the mansion itself standing amidst lovely wooded scenery, the beeches being as fine as the famous old trees at Burnham. There is good stabling, the neighbourhood is historically interesting and naturally picturesque.

MR. JAMES HINE, in a speech before the Devon and Exeter Architectural Society, to which we made reference last week, said that in an age like the present, when nearly everything pertaining to a building could be produced by machinery, there must necessarily follow great monotony and absence of artistic interest in the buildings—largely composed of them. Trade catalogue Architecture might be all very well from a strictly commercial and economical point of view, but the tendency of it was to destroy all individuality in a building and to drag Architecture proper into oblivion. Buildings were being pulled down in all parts of England possessing historical interest and features of architectural beauty; were they to be supplanted by lifeless structures of this automatic type? This was a subject which demands the consideration of all. Let them hope that in the coming century, as in all great periods of Architecture, buildings might be more and more the reflex of the individual mind of the architect.

It is stated that Mr. Armstrong, Director of Art in the Science and Art Department, will definitely retire from the service in September next. The post, in relation to the Art education of the country, is of the greatest importance, therefore in Art circles the prospective vacancy is already exciting much interest, and several well-known names are mentioned in connection with it, prominently Mr. Alfred Gilbert, R.A., Mr. Herkomer, R.A., and Mr. Walter Crane.

THE monument which has been erected to the memory of the Duke of Clarence and Avondale, in the Albert Chapel at Windsor Castle, is a beautiful work of art. It was designed and executed by Mr. Alfred Gilbert, R.A., and, with the exception of a few minor details, is virtually completed. It will be remembered that within a year of the decease of Prince Albert Victor his remains were enclosed in a handsome sarcophagus of Mexican onyx, a rare and costly stone, which had been specially chosen for the construction of the Royal tomb. This sarcophagus has now been surmounted by an exceedingly interesting group of statuary, exquisitely wrought in bronze, aluminium, and marble. A recumbent statue, representing the Duke of Clarence attired in the handsome uniform of his regiment, the 10th Hussars, and lying in the folds of the Garter robe, reposes upon a massive yet elegantly-designed gun-metal

bier. The gold military embroidery upon the collar and cuffs and aiguillettes are treated conventionally. The head and hands are sculptured in white marble, the delicately-chiselled features being an excellent likeness of his Royal Highness. In the Prince's right hand is a drawn sword, and round the blade is a spray of olive leaves, the end of which rests upon an open gilt-edged Bible. The lining of the robe is composed of aluminium, in imitation of the inner silk drapery of the Garter vestment. A beautifully-modelled angelic figure, also cast in aluminium, and holding a gilt corona typical of the crown of eternity, twined with light foliage, kneels sorrowfully at the head; and near the feet will presently be placed a figure representative of Love mourning, burying its head in a closely-wrapped veil and holding an incompleting wreath in the right hand, which depends listlessly by its side.

M. RODIN, the sculptor, is at daggers drawn with the Literary Society, which refuses to accept his plaster cast statue of Balzac now in the Salon. The sculptor sought to chisel out an ideal Balzac, the author of the marvellous synthesis of life called the "Comédie Humaine," but the literary people contend that the model statue evolved by M. Rodin makes the great novelist look like a lunatic in a strait waistcoat. The sculptor is so disgusted that he calls the men of letters grocers. He also threatens to withdraw his cast from the Salon, especially as he has received an offer for the statue. The sculptor's theory is that he ought to build an ideal Balzac, not a mere photographic and commonplace copy of an ordinary man, such as he says others nowadays supply for commercial commands. The literary people, however, want Balzac as he was, and devoid of anything romantic or ideal. The author of "Père Goriot" seems, therefore, destined to have a longer wait than ever for a memorial in marble or bronze, unless the existing dissensions between the sculptor and the members of the Société des Gens de Lettres be terminated by an amicable understanding.

NEVER was so great a work carried on in London with so little show as the working of the Central London Railway. The western portion, which got well under weigh before the necessary purchases of properties had been effected farther east, is now approaching completion so far as the tunnels are concerned, and in a few weeks this part of the undertaking will, it is expected, be out of the contractors' hands. Every section of the line is now making rapid progress, including that portion under the Holborn Viaduct. To burrow under a structure of this immense weight, as well as beneath the old "Fleet ditch," which modern engineering has converted into a main sewer, is a particularly daring venture. This part of the work is being carried on under compressed air. At the western terminus at Shepherd's Bush a start has been made with the great depot for the electrical generating plant. Foundations are being got in for the necessary buildings, including two immense chimney stacks.

THE most difficult piece of engineering work since the making of the Midland Railway through Darfield is being carried out in widening the line between Darfield and Wath-on-Dearne, by Messrs. Walter Scott and Co., contractors, Newcastle-on-Tyne. This is the Midland Railway's main line between London and Scotland, and as a consequence the present traffic cannot be interfered with, so that the work of excavation for removing the tunnel, which is 132 yds. long, has to be done without stopping the goods and passenger traffic. From the tunnel mouth to the surface is solid rock, about 75 ft. in depth, and to remove this the contractors have sunk two shafts 40 ft. deep, and are driving a drift to the southern end of the tunnel. When this is done, the surface and rock over the tunnel will be removed, tipped down the shafts into wagons, and conveyed through the drift to another portion of the widening. To remove this weight of rock without shaking the masonry is a remarkable piece of engineering skill.

FOUNDATIONS *

AS APPLIED TO LONDON BUILDINGS
AND RIVERSIDE FOUNDATIONS.

By A. T. WALMSLEY.

THERE are few subjects with which an architect has to deal which involve the consideration of so many points of detail as the subject of foundations. It involves a knowledge of the applicability and the durability of various materials, experience in drainage, and not infrequently an acquaintance with contractors' plant as well as the best way of economically distributing structural loads, for which expert knowledge engineers are usually given credit. The variation in London soils and subsoils is well described in a pamphlet written by Mr. Horace B. Woodward, F.R.S. So much of the top soil with which foundations are concerned is of an artificial character, that

ONLY ACTUAL EXCAVATION CAN DETERMINE the true nature of a site. Geological maps furnish standard information respecting the natural lower strata, but possess very little value as regards the mixed character of the top soil. Made ground may be 1ft. to 25ft. or more in thickness. At the Bank of England there were 22ft. of made ground resting upon 4ft. of gravel. Some of the made ground is of ancient date, and preserves relics of Roman occupation, but in some parts the subsoils have been excavated for ballast or gravel as at Kensington, or for brick-earth as at Highbury, and the pits filled in with rubbish. A rock which forms an excellent and unchanging foundation in one situation may prove a dangerous foundation in another. Thus, chalk forms a good limestone foundation in certain positions, but when it dips towards a slope or a cliff, with an outcrop of the gault or other underlying clay, it is a very unsuitable foundation for any building, as the landslips of the Isle of Wight and of the Dorsetshire coast bear witness.

CHALK IS SUBJECT TO DISSOLUTION

by the action of carbonated water, whereby comparatively wide cavities become formed in its surface, which may be wholly or partially filled with gravel and sand, and cause inconvenience. In the same way to be partly on gravel and partly on clay or brick-earth, to be on or over the margin of an old excavation since filled with rubbish, may lead to trouble. Where foundations are carried down into clay, the excavation may form a tank, into which the water from surrounding gravel may accumulate. The variations in the upper soils of the metropolitan area may be illustrated by the following records:—At the Chelsea Barracks, boring through made ground and running sand, shows the clay to vary in depth below Trinity high-water level, which is 12ft. 6in. above Ordnance datum. In 1895 a return of the burial grounds in the County of London, with a statement of their size, ownership, and condition was prepared for the London County Council by Mrs. Basil Holmes, from which it appears that there are 362 burial grounds existing in the County and City of London, of which 321 are disused. Of this number 90 are employed as public recreation grounds, and the remainder are closed. Prior to the passing in 1884 of an Act to prevent the erection of buildings on burial grounds, about 100 to 150 graveyards had been entirely built over, appropriated as sites for railways, or annihilated by new roads. Her Majesty's Stationery Office Waste Department stands on a site in Earl Street, Westminster, formerly used as Hartley's marble works, but originally the site of the plague pits connected with the Tothill Fields pestfield, of which area Vincent Square now remains open as the playground of Westminster. The pesthouses erected in 1642 were not removed until this century. Charterhouse Square, Holborn, is also a part of the site of a burial ground, dating back to the fourteenth century, for the burial of those who died in the

plague of that time. In the County of London the only encroachment now permissible on a disused burial ground is the enlargement of an existing place of worship, although in the City the Commissioners of Sewers have the right, under certain circumstances, to appropriate portions of them for the widening of roads. There are

EXCAVATIONS IN THE METROPOLIS

in which human bones have been discovered on sites which have been dug out, and then filled in with debris from disused burial grounds adjoining, when the latter were used for building, before the passing of the Disused Burial Grounds Act (47 & 48 Vict.). The above report, which is accompanied by a map, definitely fixing the position of old burial grounds, is therefore of great value. A boring made in Tallis Street, on the Victoria Embankment, showed the following strata:—(1) 1ft. 6in. ballast, dirty; (2) 6in. green sand, wet and dirty; (3) 2ft. peaty clay; (4) 6in. green sand; (5) 5ft. 6in. peaty bog; (6) 9ft. running sand; (7) 4ft. clean ballast resting at a depth of 23ft. below the ground line upon blue clay. A boring at Highbury New Park gave (1) 2ft. made ground; (2) 18ft. loam; (3) 9ft. sand; (4) 4ft. peat; (5) 8ft. gravel and sand. A boring at Peckham gave (1) 3ft. gravel; (2) 14ft. loam and sand; (3) 3ft. gravel. At Kensington, the soil is described by Mr. W. Bennett Rogers, in a paper read before the Institute of Estate and House Agents, "to be mostly a rich dark loam; secondly, a silicious gravel from 5ft. to 10ft. in thickness; and, thirdly, a strong leaden-coloured earth known as blue clay." The foregoing observations show that while

TRIAL BORE-HOLES SHOULD ALWAYS BE MADE

before designing a foundation, to ascertain the character of the subsoil, care must be taken not to calculate upon uniformity. Thus at the Admiralty extension new buildings forming block 2, now in course of erection by Messrs. John Mowlem and Company, one of the bore-holes upon the south-west side of the old buildings showed the clay to be about 29ft. 6in. below the surface of the ground, while actual excavation proved the dip of the clay to be such that in the execution of the new building it became necessary to underpin the north-west corner of the old building at the deepest part, 42ft. below the ground. The strata in the bore-hole referred to gave about 18ft. (average) made ground, 2ft. ballast, 5ft. dirty sand, 2ft. 6in. clean sand, with 2ft. running sand and slurry, making a depth of 29ft. 6in. to the clay. The old walls of the Admiralty premises were found to be built upon oak sills. These were removed where underpinning was necessary, so as to build and pin up with solid brickwork. There being two floors below the ground in the new building, a concrete retaining wall has been constructed completely round the exterior below the ground and joined up to the underpinning work; the whole site being covered with concrete 6ft. thick, thus forming a huge tank of an average inside clear depth of 20ft., in which the basements are built. The underpinning to the old wall consists of brickwork 4ft. 3in. thick and 14ft. to 20ft. deep, below which concrete 6ft. deep, with set-offs of 12in. on one side are inserted to a width of 5ft. 3in. for the upper portion of 3ft., and a width of 6ft. 3in. for the base or lower portion of 3ft. Messrs. Leeming and Leeming are the architects, who also designed block No. 1, forming the new Admiralty buildings facing St. James's Park, the foundations for which are likewise somewhat appropriately placed in a dry dock built upon the London clay at a depth of 30ft. in solid concrete 6ft. thick. At the Hotel Victoria in Northumberland Avenue, Mr. Henry L. Florence, the architect, states that this building has a frontage of 300ft.: 38ft. 6in. made ground clay and gravel mixed, 4ft. gravel and sand, 6ft. rising sand, 2ft. fine ballast, and at a depth of 50ft. blue clay. At the south end the clay was 43ft. down. At the north end 37ft. The front wall was constructed on a concrete bed 9ft. wide. Another bed 15ft. wide carries the two walls of the central corridor. The whole site was surrounded by a similar wall of concrete, about 6ft. wide, forming a species of boxes,

and the whole covered with a depth of 6ft. of concrete, upon which the walls were raised. The spaces between are now probably full of water. At the Grosvenor Hotel, Pimlico, there were 4ft. of made ground overlying 11ft. of alluvium, and 9ft. of sand and gravel. Messrs. J. Grover and Son, Wilton Works, New North Road, N., forward the accompanying description of

BORE-HOLES MADE IN PARLIAMENT STREET before starting the trenches. The foundations are Portland cement concrete, and go down to the ballast or to the London clay as described. The concrete was 6ft. and 5ft. wide under external walls, and 4ft. under the interior walls. The site is that of an old creek that ran up to Scotland Yard. When Messrs. Grover were building New Scotland Yard they came across old wharves and barges at about 30ft. below the level of the Embankment. As the water from the land still finds its way through the old channel, the foundation required the aid of pumps.

BORINGS AT MESSRS. GRINDLAY'S BANK.

All depths are measured from basement floor level 22ft. below pavement. The water in all holes, except E, rose 15ft. from surface.

Messrs. Holloway Brothers, of Battersea, formed a foundation where they encountered running sand upon a site in Parliament Street (the Swan Electric Light premises, near Grindlay's Bank) by driving small piles—7ft.

* A Paper read before the Architectural Association on Friday night.

or 8ft. long and 6in. circular, and pointed—as close together as possible over the whole foundation; then sawing off the tops level, and building a concrete raft 7ft. or 8ft. thick over the whole area.

THE NEW CITY HALL, BELFAST,
designed by Messrs. E. Thomas and Son, architects, Queen Anne's Gate, stands on a piled foundation, the site being a deep stratum of yielding alluvial deposit. Such foundations are common in Belfast, and generally consist of larch or other straight round timber, often 40ft. to 50ft. in length. The custom is to saw off the heads of the piles after driving to a proper and uniform level, and place upon them timber sleepers (as shown in the diagram) to aid the support of a concrete table. Mr. Florence obtained the following section for a building in Victoria Street, Westminster:—(1) 4ft. made ground; (2) 4ft. black peaty silt; (3) 3ft. sand and gravel; (4) 13ft. coarse gravel. At the Army and Navy Auxiliary Stores, the formation at about the same depth was also found to be sand and gravel. A clear stream of water runs through it, in which a chimney shaft was built by the aid of pulsometers and sumps. The area of these premises has a foundation of 5ft. Portland cement concrete all over it, 7lb. lead being used as a damp course.

AT THE NATIONAL BRITISH GALLERY,
Grosvenor Road, designed by Mr. Sidney R. J. Smith, the soil consists of surface earth over peat, under which are clayey bands and bands of sandy clay, all of which were pierced by the foundations until the ballast of the river bed was reached at an average depth of 17ft. to 20ft., and in some parts 25ft. No particular difficulty was experienced. The site is that of the old Millbank Prison, known as the Penitentiary. At the gas works in the Horseferry Road 30ft. of gravel are recorded as having been passed through, and this gravel is frequently water-logged, so that, where foundations of houses pass into it with unprotected basements, the water becomes troublesome during high tides, rising in the cellars of houses built upon such low-lying ground. Alluvial deposits prevail over part of the area, consisting of silt and clay, varying in thickness from 7ft. or 8ft. to a thin crust. The gravel and sand on the site are of considerable thickness. In the case of a clayey subsoil overlying a watery gravel, where the structural loads are not sufficient to warrant extending the foundations through the gravel to the clay, it is well to leave a thin crust of the clayey material over the gravel so as to prevent the water working up through the foundation, which would cause the gravel to work loose.

IN DEALING WITH A LOAMY SOIL
it is quite possible to overload a foundation. Water will drain through a loamy soil that is not spongy. When dry like cheese it does not then contain the argillaceous matter which gives it a spongy character, and which would cause it to run, under pressure, like mud. The following is an example of the use of the brick seating on concrete for piers to a warehouse, built over a good dry compact loam foundation: Concrete footings provide a distribution of weight over the whole area when a sufficient depth of concrete for a footing is put in, because every cavity or unevenness of the ground is properly filled with plastic material. Concrete also is quite as good as brickwork or masonry to bring the work up to the surface under ordinary circumstances, but in the case of piers subject to vibration, brickwork is decidedly preferable. Brickwork also may be used of smaller dimensions than concrete, so that the space occupied is less. Thus, at the Borough Market, Southwark, where the foundations had to be carried down from 22ft. to 24ft. below the ground line, the piers carrying the roof columns were built in brickwork over concrete footings. When stone templates are introduced on top of piers, as is frequently found expedient, it must be remembered that the great thing is perfect bedding of them in cement.

AT THE TOWER BRIDGE,
layers of canvas and red lead were placed between the base of the steel columns and the

granite beds upon which they stand, in order to obtain a uniform bearing over the whole surface. Felt carefully laid under the bearing of iron girders is preferable to sheet lead, unless the pressure is sufficient to crush the lead so as to ensure a uniform distribution of pressure. Portland cement should be used for concrete work under a bed stone. Ordinary lime concrete is long in setting. The centre of the mass of a large concrete block may not become hard for years, where a block made of one part Portland cement to seven parts of other approved ingredients, carefully and well mixed, will safely bear a load of five tons per square foot. According to Mr. Stoney, bricks not of an extra hard description in cement will bear a crushing weight of 521lb. per square inch, or 33½ tons per square foot. Allowing a factor of safety of 6, we obtain 5·6 tons per square foot safe load. Rivington's notes on building construction give brickwork in mortar ½cw. per square inch safe resistance to compression, or 3·6 tons per square foot. The resistance of brickwork to cracking or crushing in a pier is much less than that of the bricks alone. Ordinary stock bricks will stand 8cw. per square inch, or 5½ tons per square foot. Much valuable information hereon was given in the investigations made by three series of experiments on brickwork tests, made for the Royal Institute of British Architects and published in their journal. In the case of the Imperial Institute, bearing plates for the girders, where resting on brickwork, were calculated for 16 tons per square foot of area, but then special bricks of Jennings manufacture, built in cement, were employed.

IN FIXING STANCHIONS OVER A CEMENT BASE
it is necessary to provide ample space for grout. The stanchion is set vertical by means of long and shallow wedges, occupying a depth sufficient to allow 1½in. under the base of the stanchion, and a hole 2in. diameter should be left in its base, as near the centre as possible, not to pour in the grout but to see it rise when the under part of the stanchion is completely grouted up. A temporary trough is formed round the base to receive the liquid grout, and the wedges should not be drawn until the grout has well set. In the case of a roof of three spans, subject to the effects of lateral wind pressure, when supported on side walls with intermediate columns, where the situation did not permit either the addition of buttresses or of anchorage in these side walls, the horizontal reaction of the wind pressure may be taken by anchoring the intermediate columns to a concrete foundation. At the Institution of Chartered Accountants, Moorgate Street, Mr. John Belcher found the ground so unreliable that he adopted the precaution of putting a layer of Portland cement concrete over the whole site 3ft. deep. The result has been satisfactory, no settlements having occurred anywhere. At Kennet's Wharf, upon

THE MIDDLESEX SIDE OF THE RIVER,
near Southwark Bridge, the foundation consisted of 8ft. concrete spread all over the site and increased in thickness under the main walls. The late Mr. G. E. Street, R.A., used selenitic lime in the concrete foundations of the Law Courts. Under some of the walls it was 7ft. thick, and that under the walls of the Great Hall was 10ft. thick. Portland cement concrete rafts, 2ft. thick, have been built under five-story buildings on compact loamy soil over gravel, the concrete being dipped where required to obtain the proper fall for drainage pipes to run over the surface. Another plan frequently advantageous to adopt is to sink piers 12ft. to 15ft. (centres) apart, and 4ft. 6in. square, in pot holes dug out of made ground, and then to form concrete arches over the intervening unreliable ground, with a minimum thickness of 18in. This plan was adopted by Messrs. F. and H. F. Higgs for some premises at Stratford and at Lea Bridge, also for a church at South Bermondsey. In the latter case, 6ft. of soft clay or mud, then 5ft. or 6ft. of peat and 4ft. of running silt had all to be gone through before the gravel was reached, and the concrete piers were here connected by a concrete lintel 3ft. thick, in which steel joists were embedded.

At the Institution of Civil Engineers, 25, Great George Street, Westminster, the foundations to the two party walls upon each side of the Institution building were carried down about 22ft. below the pavement level, that on the west side being 22ft. deep, that on the east side 24ft. The front wall was 25ft. below the paving level. The concrete was laid under walls only, and was about 10ft. 6in. by 5ft. 2in. wide at the east party wall. Mr. Charles Barry was the architect, and Messrs. John Mowlem and Co. contractors. The Institution of Mechanical Engineers,

AT STOREY'S GATE, WESTMINSTER,
stands on what appeared to be a wharf, and the roadway in Princes Street was possibly an inlet of the Thames. The contractors excavated the piling and black earth, formerly, doubtless, faggots, and gradually came to a fine Thames sand at a depth of 23ft. below the roadway, gradually getting coarser until fine gravel was reached at a depth of 28ft. below the roadway, upon which the concrete foundations were laid. The main walls were then marked out and excavated to a mean level of 28ft., the strata gradually developing into a fine gravel, which Mr. Basil Slade, the architect, considered, after sounding, to be a good foundation. On this, concrete composed of blue lias lime and Thames ballast was laid to a depth of 10ft. 6in. and width of 7ft. 6in. Water seemed to circulate through the gravel below a mean depth of 23ft. 6in., and the influences of the tides were felt. A pulsometer pump in a well was set to work, and the trenches drained sufficiently to allow of work being executed; after the concrete was all laid, the water was allowed to find its level. At a depth of mean level 15ft. 6in., a table-top or basement floor was laid, and a layer of Portland cement concrete 6in. thick as foundation of finished floor in granolithic or asphalt. The strata throughout was very even, and the work progressed steadily without difficulty. There are two floors below the ground floor, both of which, the architect states, are as dry as a bone. The damp course and retaining wall lower course was of trowelled Seyssel asphalt. The precaution was taken of putting drain pipes in the concrete below water level, to allow the water to pass freely through the sand and gravel within the main walls.

AT THE SURVEYORS' INSTITUTION,
12, Great George Street, in the new building designed by Mr. Alfred Waterhouse, architect, and built by Messrs. Foster and Dicksee, contractors, the section of strata shows 3ft. or 4ft. of made ground on top, about 4ft. black mud, 6ft. clay and brick earth, clay and sand mixed, and 3ft. gritty sand, below which is the ballast, or London gravel. In some cases the foundations were carried down 18ft. deep, but only where the principal weights of the structure occurred. A concrete (six to one) raft, 2ft. 6in. thick, is carried on continuous concrete walls round part of the outside and under main walls and piers of the building. Continuous concrete about 14ft. deep under the raft, and width 5ft. 6in. to suit the footings of a 2ft. 3in. wall (footings 4ft. 6in. plus 6in. concrete either side = 5ft. 6in.) All timber was removed in lengths of, say, 10ft., 3ft. framings as the concrete filling was carried up. At the British Institute of Preventive Medicine,

CHELSEA BRIDGE ROAD,
the foundations were carried through made ground and clay under, to a depth of 40ft. below street level; under the clay was found peat, and under the peat 5ft. to 6ft. of fine dirty sand—then ballast. A concrete raft, 3ft. 6in. thick (six to one), intervenes between the top of piers and the bottom of the brick footings. The position of the piers under the raft was settled by the cardinal points of the buildings, thus forming a kind of propped-up dining table or platform with several legs. Mr. Dulac, one of the contractors for the Paris Exhibition of 1900, has endeavoured to avoid the labour of excavation and necessity of carting away bad ground; also to save the expense of timbering and trenching by compressing and ramming the soil in the following

manner. With the aid of a steam pile-driver and the employment of rams of various shapes he forms a bore-hole, which he fills with hard substances after each stroke of the ram. Thus, in dealing with a light, friable soil, a conical ram is used, and in some cases a mushroom-headed ram is applied successfully. In this way, by forming holes about 3ft. apart, and forcing the selected material sideways into the ground surrounding the cavity, the soil is consolidated to receive a superstructure. The drop allowed for the ram depends on the nature of the ground, the operations in the case of water-logged soils being aided by the insertion of ashes mixed with quick-setting cement, intended to produce a species of tube or sheath for the passage of the ram in the driving in of further hard substances.

AT VICTORIA STATION, PIMLICO, the engineer to the L. C. and D. Railway, Mr. Roche, states that in recent work they have found good gravel at a depth of 16ft. from the surface, and have dug 8ft. into the gravel without passing through it. At Sion College, upon the Thames Embankment, Messrs. Foster and Dicksee state that in this foundation they went down to the London clay. The method there adopted was to have great pier holes about 8ft. by 8ft. on plan, going right down to the clay, filled up with cement concrete, and from these brick arches carrying the main walls. In cases where partly made ground and partly water-bearing gravel is encountered, a raft of concrete, about 6ft. to 9ft. thick, has been successfully used with a gridiron of steel contained therein. An example of steel construction introduced into a concrete foundation at points where main pressure occurs is the case of the building of a new front to a Congregational chapel.

AT CANNING TOWN, designed by Mr. F. W. Troup, architect, where the foundations had to pass through layers of peat and clay to the ballast below, and where the new front had to be constructed so as to be independent of the interior existing building. At some premises known as Mansfield House, by the same architect, concrete 3ft. thick was laid as a foundation, with 8in. by 3½in. rolled steel joists, having bolts 12in. long at each end, so as to give a tie in the centre of the concrete raft in which they were embedded. Very little excavation was needed. The subsoil consists of layers of peat, peaty clay, and clay to a depth of 15ft. to 20ft., when good ballast is reached. The foundation sunk 1½in. at one corner at the back of the premises, and 2in. and 3½in. respectively at the two corners of the front of the premises, but no cracks appeared in the building generally, and the sinking appears to have gone on as the building rose. One corner of the building in front overhung about ½in., but the other parts of the building appeared to remain quite vertical. At the back of the premises, the top of the concrete, which was laid 9in. lower than in the front portion, was 18in. above the natural level of the ground. It is natural that the lower down the river we go, any foundation work becomes more troublesome than is generally experienced in up-river sites. In

(To be continued.)

FOUR stained-glass windows have been erected in St. Michael's Church, Stone, Birmingham.

A NEW CHURCH, seating some 600 people, and costing about £4000, is being erected at Winton, a suburb of Bournemouth.

A NEW organ has been constructed in Lisnakea Parish Church. The builders were Messrs. P. Conacher and Co., Huddersfield and Dublin.

PLANS have been passed by the Doncaster Corporation for a new theatre to be erected by Mr. J. W. Chapman on the site of the present circus and music-hall in Station Road.

THE County Hall, Lewes, is to undergo alteration. The seating arrangements of the Council Chamber are to be improved, and the East Sussex County Council, who are to carry out the work, propose to purchase, for £3500, some property adjacent to the Hall, with a view to its ultimate enlargement.

THE CONSTRUCTION OF TOWN BUILDINGS.*

BY HOWARD CHATFIELD CLARKE, F.S.I.

THE following remarks are mainly devoted to the planning and constructional side of buildings, but I desire to say that I am of opinion that, although a man must devote a large share of his attention and time to such matters, they in no way supersede his work as an architect, but rather help him in giving his buildings architectural character. I propose to consider town buildings from the point of view (1) of construction, (2) of materials, and (3) last, but not least, of cost. For dealing successfully with buildings like city banks, offices, warehouses, showrooms, and schools, regard must be had to

- (1) Simplicity of plan and arrangement;
- (2) Ample lighting to all parts;
- (3) Good means of ventilation and warming;
- (4) Good sanitary accommodation and drainage;
- (5) Protection as much as possible from fire; and
- (6) The employment of suitable materials for the purposes for which the premises are intended.

I know full well how the difficult limitations of confined situations, poor frontages, and numerous awkward angles, sites dominated by ancient lights and surrounded by defective party or other walls, militate against the realisation of ideal requirements; but it is exactly at this point that the experience of a professional man comes into play, and gives him his opportunity of showing how all these and many other difficulties may be overcome.

CONSTRUCTION.

How far do modern methods of construction forward these objects? I have no hesitation in saying that, upon the whole, they do so to a very large extent. In former years town warehouses were built with extremely thick walls, floors of low elevation, with die square timber uprights and wooden beams supporting them, low windows with cast-iron frames, and basement floors laid on the ground, with no provision for keeping back damp, and with no proper sanitary arrangements. As for their external appearance, the least said the better. Doubtless there are many such buildings remaining in Manchester, as there are in the City of London, especially that part of the City near the river. What is the case, however, to-day? All well-designed warehouses are built with as little unnecessary brickwork as possible, and no internal walls where they can possibly be avoided; with floors of fair height and unencumbered by posts or columns, as far as is practicable, and with proper lavatories to the open air in more than one floor of the premises. Our fifth requirement as named above (the protection of a building from fire) opens up the extremely large subject of

WHAT IS A FIREPROOF BUILDING?

and with it the laws and regulations under which we have to work. This subject will be fully dealt with in the Paper which Mr. Blashill has prepared for this meeting, but I may be permitted to refer to it very briefly here. In London we practitioners have all been sent to school again in a large measure by the London Building Act of 1894, which came into operation on January 1st, 1895, and superseded the Act of 1855. A short reference to the new Act as it affects the construction of buildings will, I hope, not be out of place here. Buildings under this Act are classed under four heads:—Dwelling houses, domestic buildings, public buildings, buildings of the warehouse class. Among the regulations set forth, applying to "domestic buildings" erected after the commencement of the Act, section 43 provides for sites which have been occupied by a domestic building (at any time within seven years previous to the commencement of the Act) by giving power to erect a new building

on as much land as was previously occupied, if drawings of the previously existing building have been duly submitted to and certified by the district surveyor. This section, I think, is of considerable advantage to building owners, as the district surveyor's certificate is taken as conclusive evidence of the

CORRECTNESS OF THE PLANS,

and therefore of the old buildings existing upon the site. Under section No. 47 no building is to be erected to a greater height than 80ft. without the consent of the Council. Looking to the great height of modern structures, I think this regulation a reasonable one. High buildings in towns create cold, draughty, and sunless streets. One of our finest improvements in London, Northumberland Avenue, always appears to me to be spoiled by the excessive height to which buildings have been carried up on either side of it. I regret I have not seen American cities, but the impression given one by photographs is that the extreme height of their buildings does not help either their architectural beauty or their convenience. I believe the

WIDE STREETS AND LOW HOUSES

in East London and the suburbs of the large provincial towns, which allow of the free circulation of air and sunlight, add very materially to the general healthiness of the inhabitants. The section of the Act relating to cubical extent of buildings and the uniting of buildings are interesting:—Buildings of the warehouse class are not to exceed 250,000 cubic feet unless divided by party walls, unless the sanction of the London County Council be specially obtained, and even then the area is not to exceed 450,000 cubic feet. If two or more buildings in one occupation exceed the cubical area above-named they can only be united by openings 7ft. in width and 8ft. in height, such openings being fitted with

TWO WROUGHT IRON DOORS,

each ½in. thick in the panel, at a distance from each other of the full thickness of the wall. The Fire Offices Committee's Regulations exceed the requirements of the Act by insisting on chambers at least 6ft. in the clear being built in brickwork, with, of course, solid roofs and floors and iron doors fitted to these. After a careful survey of the recent great Cripplegate fire I am convinced that both the Act and the Regulations above-named should be varied as regards these iron doors. If openings are allowed to be made at all in a party or two external walls (and it would be a great hardship if they were not), the opening part when closed should be made fire-resisting as much as possible, and this will never be so with such thin doors as above described. Over and over again fire has got through these doors, and

BETTER FIRE CHAMBER DOORS

should, in my opinion, be always specified. The large series of warehouses and showrooms I have just completed in Aldermanbury, City, have numerous connections as described above, but I have fitted these openings with expensive fire-resisting chamber doors made by Messrs. Chatwood and Son, and I believe these doors will resist fire to a much larger degree than those which would have satisfied the surveyors of the London County Council. I have seen a copy of your Manchester by-laws, and I do not discover in them any provisions regarding the size of warehouses, and I am sure we shall all be interested to hear if I am right or not regarding this important point. Section 78 deals with the construction of public buildings, which must be to the satisfaction of the district surveyor, with powers of appeal, in the event of disagreement, to the tribunal to which our Institution nominates a member, and all the members of which are connected with our Society. The 7th and 8th parts of the Act I have not time to refer to in detail, although the latter part, defining

THE RIGHTS OF BUILDING

and adjoining owners, is important. Several new powers are given under this part in addition to those in the 1855 Act, among others the power to deal with party fence walls, the underpinning of adjacent premises (within

* A paper read before the Surveyors' Institution at the recent meeting at Manchester.

10ft. of new buildings) upon terms, and these are, in my judgment, distinct aids to the building owner. In the second schedule to the Act the materials are described which, for the purposes of the Act, shall be deemed to be fire-resisting, and among others we find that oak, teak, or other hard timber, not less than 2in. thick, is allowed for doors and stairs, with 2in. risers, and concrete composed of broken brick, stone chippings or ballast, and lime cement or calcined gypsum when used for filling in between joists and floors. I trust you will forgive me for trespassing upon your time with this very imperfect reference to a very important Act, but I feel it is the outcome of much thought and care, and applies to the construction of buildings in the largest of cities, and that it bears so directly upon the question of protecting property not only from

BAD BUILDING,

but from fire. We, as members of this Institution, will always look back with pride to the part it took in the evolution of this Act of 1894. Not only did we spend nearly £1000 in doing so, but three members of our Council, Mr. Steward, Mr. Cubitt Nicholls, and Mr. Gerrard (the latter two gentlemen unfortunately now no longer with us) gave upwards of thirty days' gratuitous attendance in the committee rooms when the Bill was in Parliament. The great fire in St. Mary Axe a few years since, and the still greater a few months ago in Cripplegate, prove that there is still much to be done towards preventing such awful calamities in the future. The great lesson, I think, to be learnt from both of these fires is that ironwork, unless cased, is the most destructive of all agents. When subjected to great heat, columns and girders twist, buckle, and contort themselves into every conceivable shape, and by so doing wreck the premises they are designed to support. I think it is a question deserving great consideration whether we should not omit from the external walls of buildings all

HIDDEN STEEL OR IRON GIRDERS

and stanchions, and make these walls real walls capable of supporting themselves. We should be returning to a much simpler and, I believe, a safer method of construction, and the space required for thicker walls or tiers of brickwork should not be grudged when necessary for the safety of the building and the surrounding property. If I am correct in this statement, many of the warehouses and showrooms built within quite recent years would come under this dangerous class. After the days of the old brick and timber structures, cast and wrought iron came to be largely used and often left exposed, and therefore formed an element of danger and risk from fire. After a heavy fire like the Cripplegate one, it is useless, in my opinion, to suggest much wider streets in future and fewer and less crowded buildings. The conditions of a town make this impossible, but it is possible to materially decrease the risk of fire by insisting:

- (1) That all party walls are carried up say at least 4ft. above the slope of the roofs;
- (2) That all iron doors in party walls are of a much better description than now specified in the Act;
- (3) That all ironwork, both that exposed and all girders not exposed, are cased with plaster at least half an inch thick;
- (4) That party walls dividing skylights from adjoining buildings are carried up considerably higher than at present;
- (5) That external iron shutters are used in confined well-holes and areas overlooked by premises in several occupations.

In the warehouses in Aldermanbury I have caused every piece of ironwork to be cased with plaster; and, with the fireproof chambers as described above between the various premises, I believe if one portion were alight there would be a good chance of saving the others. One word regarding so-called fireproof floors. Their name is legion, and although I do not profess to have used a tithe of the various patents, I have used many, and

believe a floor filled with good clean coke breeze, mixed in the proportion of five of breeze to one of Portland cement, makes a very rigid, light, and fire-resisting floor. I have drawn out details of such a floor, but I know there is nothing new in it. To the construction of buildings such as banks, flats, or offices, I think the leading requirements we have been considering in detail equally apply, but their actual construction must follow upon the special requirements of each. I always feel

PROPER LIGHTING

to be the most important point. Some years back I commenced to use a special shaft for the lighting and ventilating of basements, trimming the ground floor generally in its darkest parts to enable this to be done. If the walls and slopes are built in white glazed bricks, I find that these areas make the parts in the basements near them practically as good as ground floor offices. The carrying up of all windows in town streets into the floor above that in which they are situated, and trimming the floor, has a most advantageous effect upon the lighting of premises and often saves the

LOSS OF VALUABLE SPACE

caused by the introduction of central well-holes through the various floors. Iron skylights and internal glazed partitions made in metal are also among more modern conveniences for properly lighting our buildings. With regard to the proper ventilation and warming of buildings, both large and small, I feel we have still much to learn. I think it is generally admitted that when an amount of fresh air is introduced into a chamber, adequate to change the air thoroughly, draughts are almost unavoidable. The only simple remedy appears to me to be

TO DISTRIBUTE THE INLETS

as much as possible, not to introduce them at too low a level, and to fit the apertures to them with metal or wood tops with conical-shaped holes, thus diffusing the air. With electric and other forms of fans for extracting vitiated air, this difficulty is largely overcome. For an ordinary room there is no better ventilation than the old-fashioned double hung sash, especially when it is fitted with a deep sill-board for the admission of fresh air at the meeting rail level. Grates fitted with warm air-chambers are a great boon both for winter and summer use, and are largely fitted in London, especially in the Board schools. The "Plenum" system, so much in use in the Midland Board schools, is doubtless also used here in the North. There is no doubt it is more costly to introduce in the first instance, but it ought to be economical in working as regards fuel. The great drawback appears to be the necessity for the constant attendance of the caretaker to regulate the supply of heat required in the various rooms. My fourth requirement of

GOOD SANITARY ACCOMMODATION

and drainage is a most important one in the construction of a building, and I believe it has never received the attention it is receiving to-day. The old fashion of laying drains at the last moment anyhow, and practically with any sized pipes that could be easily obtained, has given place to drains properly laid, easily accessible, well ventilated, and generally made of glazed stoneware. I believe we all owe a great deal to the late Sir Henry Doulton for inventing (certainly for bringing to perfection) this simple but most useful material. The result of the improvement in drainage is shown in the health of the community, as, although our large towns increase so rapidly year by year, the general health is good and death rate low.

THE USE OF IRON PIPES

under dwelling-houses has many advantages, the main one, I think, that the number of joints, and therefore the number of causes for trouble, are largely done away with. The great want of public conveniences is at last receiving proper attention in London, and large, airy, and well-ventilated underground conveniences are now being erected, by the London vestries, fitted with automatic flushing

tanks and the most cleanly of all urinals, the "Stall" urinal. There is still in London strong opposition on the part of some of the water companies to allow water waste preventors to discharge more than two gallons. I am convinced, from practical experience, that this is not enough water to properly flush traps and drains, especially with certain forms of hopper closets, and my opinion is that three-gallon tanks should be in universal use, and that the companies should be compelled to supply water by meter to all public buildings. The increased

USE OF HOT WATER

is a source of trial to even the best lead wastes, and I find that strong iron wastes obviate much difficulty and prevent buckling. I have already considered fully the fifth requirement, viz., the protection of a building as much as possible from fire. The last requirement, viz., the use in construction of suitable materials, alone remains to be considered, and must be disposed of shortly, as I feel I have taxed your patience far too long already. In towns, brick, stone, and terracotta, with a limited use of granite, are our main materials for external walling, and there is a better selection now of any of these materials to choose from than ever before. In town buildings the

USE OF GLAZED BRICKS

is of immense advantage, not only on account of their reflecting surfaces externally, but their sanitary properties internally. The manufacture and use of faience is also one of the greatest modern improvements, giving room for artistic treatment both externally and internally, with a thoroughly practical material as regards resistance to dirt and otherwise. The decay of the stone used in the erection of buildings in towns is a serious problem, and points to the necessity of protecting the material as much as possible from the atmospheric influences which attack it. This can partly be done by carefully jointing and covering exposed cornices and strings with thin lead, but the plain surfaces should be covered with "fluaste," or some similar solution, to further protect them. I am sure we must all be glad to see the further introduction into this country of

GRANITE, THE MOST SUITABLE MATERIAL,

for many reasons, for the erection of our town buildings. I have not time to describe in detail the many additions to our decorative materials for internal use, but the selection is large, and I should say never better than to-day. The cost of building fluctuates to such an extent that it is difficult to give reliable figures, but I append the cost, per foot cube, of some premises I have recently erected. There are

TWO VERY IMPORTANT CLASSES OF BUILDINGS

which time has prevented my describing, either of which would supply material enough for a separate paper. I refer to schools and to dwellings for the working classes. The limited areas in cities have naturally forced architects to design schools in three floors, and hundreds of these are built throughout large towns, and, upon the whole, answer well. There must be, however, a considerable amount of time wasted, in reaching the upper floors, and, if the site will only permit, I believe a separate building for the infants' department and a two-story building for the girls and boys answers very well, and will be found to be rather cheaper in execution. I have lately completed a school of this description for over 1400 children in a London suburb; and the cost of this school, including all boundary walls, cookery kitchen, manual instruction room, caretaker's cottage, &c., works out at £14 10s. 3d. per child. The school is finished with glazed brick dados and buff bricks above throughout, and little plastering except for ceilings has been used. Regarding the

HOUSING OF THE WORKING CLASSES,

immense strides have been made in London during the last thirty years, and many of the City Companies as well as the large trusts, such as the Peabody and Guinness, together with public companies, have done noble work

in erecting healthy and well-built and well-lighted premises. During the last few years the London County Council have commenced to build this class of property, and I am bound to say I think their action in so doing has rather stifled and strangled private enterprise. The Council up to December last had spent over £387,000 in erecting dwellings of this description, providing accommodation for 6600 persons, exclusive of 17 shops, 100 work-shops, 12 stables, and 20 sheds. As, however, the Council are content if they see a return for their outlay of three per cent, you will agree with me that, whether they are right or wrong in so using the ratepayers' money, they practically shut the door to private enterprise upon the same basis. The Guinness Trustees, in their report of last year, put the capital of their fund at £289,456, and state that all their buildings continue to let well; that 7327 persons were living in them; and that the average weekly rent of each room was 2s. 1½d., which includes chimney sweeping and the use of venetian blinds, common room, baths, and hot-water supply.

EXAMPLES OF COST OF BUILDING IN LONDON.

Warehouses in Upper Thames Street. Brick front, wood floors, unplastered walls.	Contents. 117,600 cub. ft. Cost per cub. ft. 7d.
Schools, Campsbourne, Hornsey. Boys' and girls' schools, stock and red brick front, internally walls finished with buff bricks and glazed brick dados, wood block floors, and material stairs. Accommodation for 14,000 children.	Contents. 179,322 cub. ft. Cost per cub. ft. 1s. 1d.
Warehouses in Aldermanbury, for wholesale drapery trade. Fireproof floors, stone front, plastered walls.	Contents. 204,879 cub. ft. Cost per cub. ft. 1s. 1d.
City Offices in Gracechurch Street. Stone front, fireproof floors, stone staircase, and hydraulic passenger lift, faience entrance and passages.	Contents. 176,614 cub. ft. Cost per cub. ft. 1s. 2d.
Residential Flats, South Audley Street, Mayfair. Stone and terra-cotta front, electric passenger lift, fireproof floors, stone staircase, each flat finished with hardwood finishings, parquet floors, and enriched plaster-work.	

At a general meeting of the members of the Sanitary Inspectors' Association, held at Carpenters' Hall, London Wall, E.C., Mr. W. Wilkinson read a paper on "Dangers to Health arising from Defective Sanitation." He observed that defective sanitation, as represented by badly designed structures, inefficient workmanship, and defective materials, produced, amongst other evils detrimental to health, typhoid and enteric and continued fevers, with diphtheria. The habits of the people with respect to cleanliness, and more especially with respect to their care to protect their habitations from pollution by excrementitious matter, were a clear indication of their progress in civilisation. It was incumbent upon the local administration of the law for improving the sanitary condition of the people to show by their manner of dealing with its provisions that they regarded them as the practical fulfilment of the primitive ordinances for personal and household purification. In conclusion, the lecturer expressed the hope that, with reference to the Local Government Board inquiries in all matters relative to sanitation (whether of sewers, scavenging, or outfall works), the time was not far distant when that Board would recognise the work of the Sanitary Inspectors' Association by electing from its ranks a representative to conduct or assist in conducting those inquiries.

THE FALL OF A HOUSE.

FURTHER EVIDENCE ON THE WESTMINSTER DISASTER.

THE Westminster Coroner's Court, presided over by Mr. Troutbeck, with the assistance of Mr. John Slater, architect, as assessor, was occupied four days last week in receiving further evidence on the subject of the disaster at Abbey Mansions, Orchard Street, Westminster, W., where the collapse of the roof resulted in the death of seven workmen. In our last issue we reported the previous proceedings.—John Hammond, a labourer, who was on the building at the time of the accident was now recalled, and in reply to the Coroner, said he could almost swear that the bottom part of the concreting did not crumble or fall away before the other part of the roof. The centering boards were passed up to him quite clean, indicating that none of the concreting had crumbled. He was quite certain that the concreting did not fall first and the girders afterwards.—John Peckham, a carpenter in the employment of Messrs. J. Smith and Son, of Norwood Junction, the contractor for the joinery work, said he was on the roof of the building at the time of the accident, working at the skylight. A few minutes before the accident he noticed that there was a great strain on the jib across the opening, and the block was "squeaking." Something was evidently being raised, but he did not know what. He could not say whether anything was being raised at the time of the accident. He

NOTICED THE BREEZE CONCRETE CRACKING.

There were two or three distinct cracks parallel with the front wall. Just before the collapse he heard the rattling of boards, as if the centering was being struck. In his opinion the striking of the centering had something to do with the falling in of the roof.—Thomas Copping, a carpenter and joiner, stated that the concrete around the frame of the north light was rather soft. The workmen were hoisting by means of the jib on the centre light right up to the time of the accident. He had previously suggested that the hoisting of a weight might, in conjunction with the striking of the centering, have caused the accident. He did not think that the centering was ready for striking.—Leonard Skinner, a labourer employed by Banks's Fireproof Syndicate Limited, said he never found any of the binding girders tied with ropes. So far as he saw the girders were all fixed and bolted together in the ordinary and proper way.—Charles Smith, a labourer in the employment of Mr. Murrell, the roof contractor, and who was one of the men injured in the accident, said he was working on a scaffold immediately under the roof. He and a man named Affleck were drawing the bolts, when suddenly, without warning,

THE ENTIRE ROOF COLLAPSED,

and witness fell on the first-floor window and succeeded in getting on the coping. He could not account for the collapse. The concrete appeared to be "all right;" it was quite hard. The boards came clearly away.—Thomas Stewart, a foreman plumber, deposed that he heard a cracking sound like the crushing of a match-box, and he scrambled to a scaffold. The roof collapsed altogether. In his opinion the concrete was not fit for striking. The witness, in reply to the Coroner, said there were no scaffold poles across the centre skylight for hoisting purposes.—The Coroner pointed out that that was a distinct contradiction of what other witnesses had sworn to.—The witness adhered to his statement, adding that the jib referred to was erected after the collapse.—Henry Alfred Penfold, a scaffolder, said he was on the sixth floor striking the scaffolding when he saw the hoist go to the front, and everything fell from the roof on to the sixth floor, and thence to the basement. He believed that the poles forming the jib were erected by the contractors for the stone-work.—William Aspinall, a stonemason, said that at the time of the accident he was on the

staircase between the sixth and seventh floors, and the first thing he noticed was the pier falling over towards him. It then suddenly collapsed. He had no doubt whatever that

THE PIER COLLAPSED FIRST

and that the roof followed it. He and his mates hoisted material with the aid of a snatch block attached to a scaffold pole passed through one of the back windows. It was not near and in no way connected with the brick pier, so that any strain which was caused would not affect the pier.—Frederick George Gander, a scaffolder, who was on the sixth floor, said he noticed dust flying up above the pier, and immediately afterwards the pier "buckled up" about the level of the sixth floor. He came to the conclusion that the buckling up was the result of too great a weight being placed on the top of it. The pier stood without support, except that there were iron joists in it, and there was nothing in the middle to steady it.—Similar evidence was given by other workmen, and then Edward John Thorp was called. He said he had a contract with Mr. Reikard for the brickwork at £4 a rod without scaffolding, and £6 a rod with. That was for labour only. He did the whole of the brickwork of the south block. He did not work on the brick pier himself. The wall was built first. The footings were put in for a 2ft. 8in. wall, but the wall was reduced from off the top of the footings to 18in. The pier was built up to the level of the fifth floor five bricks by two-and-a-half bricks thick. From the fifth floor to the roof he reduced the dimensions to 3ft. 9in. by 1ft. 10in. He altered it after a conversation with Andrews, who agreed with him that the pier would be stronger built that way. Three girders ran from each floor to the pier. There were six large templates in the pier, and hard stock bricks and cement were used in its construction, not mortar, as was stated by Collins. He did not know where the bricks came from, but no soft bricks were used in

THE CONSTRUCTION OF THE PIER.

It was not true that part of the pier was erected on a template. He attributed the collapse to the fact that the concrete was not properly set, so that when the centering was removed a sheet of concrete between the lacing joists, about 23ft. in length, caved in against the top of the pier, which was the weakest point, and pushed the pier over. He saw the concrete half an hour before the accident, and he did not think it was in a fit state for the centering to be struck. Concrete of that thickness should be laid at least twenty-one days to be thoroughly reliable. It was untrue that soft bricks, unfit for use, were used inside the building. He never saw a job better supplied with bricks.—Other workmen having given their version of the disaster in corroboration of previous testimony, the next important witness was Edward D. Drury, the district surveyor, who said he received notice of the proposed erection of Abbey Mansions in March, 1896. He considered the plans, and wrote the result of his inspection on August 21st. A question had arisen as to whether the building was to be used for domestic purposes, which would have necessitated the reservation of an open space in the rear. That accounted for the delay. He wrote to Mr. Pawley, the architect, pointing out the requirements of the Building Act. It was finally settled by the Building Act Committee of the London County Council. Amended plans were afterwards shown to him by Andrews, and witness found they

COMPLIED WITH THE TERMS OF THE ACT.

He saw no detail plans. He had no powers with regard to the brick pier. If he considered a pier to be dangerous he could only report it to the London County Council after it was built. He would have control only over cross, external, or party walls. The Building Act said nothing about brick piers. He last visited the building on March 16, when he found that it exceeded the limit allowed by the Act in the height of the front wall in Orchard Street. He called Mr. Reikard's attention to the irregularity, and Reikard wrote on March 25 informing witness that the building was vested in Her Majesty's Government, and was, therefore, under section 202, exempted from the pro-

visions of the London Building Act. Witness had no control over girders unless they carried a wall. Girders leading to a pier would have nothing to do with him. If a story was constructed in a roof with the floor more than 60ft. above the street it must be built entirely of fireproof materials. The roof of this building did not come particularly under his notice.

THE BRICKWORK WAS VERY GOOD,

and the pier was made of stock bricks and cement. It was quite impossible for 1000 soft bricks to have been used without witness or his assistant seeing them. Section 146 of the Act defined his duties. He could not call attention to a dangerous building until it was erected. After the collapse he procured a sample of the concrete, and found that it was wet, but he did not think that it had been badly mixed. The moisture would add materially to its weight. He saw no concrete that could be crumbled with the hand. If the girders had remained steady and in their place he did not think the concrete could have fallen. He was of opinion that the pier was carrying two tons more than a safe load, which he calculated would be about forty-five tons. He had two theories as to the cause of the disaster. The first was that the centering was struck too soon, and that the concrete fell in consequence and levered the pier over; but that theory had been demolished since he had been in Court. He was of opinion that the pier broke because it was not thick enough. In reply to Mr. Avory (who appeared for Mr. Pawley, the architect), witness said the safe weight-bearing limit of the pier was 45 tons, and he estimated that six times that weight, or 270 tons, would crush the pier at its base. Centering ought not to be struck until the concrete was dry, but if the concrete was made wet by rain it would be comparatively unimportant. He could not tell from his examination of the fallen pieces of concrete whether the moisture which existed was produced by rain. He did not think that everything that happened would be accounted for by a large lump of concrete falling from the roof and striking one of the girders. His reason for that was that the whole of the pier as well as the 18in. wall was demolished. In his opinion it was

THE PIER THAT GAVE WAY.

Either the pier gave way and took down the girder, or the girder fell and knocked down the pier. Taking into consideration the thickness of the concrete, seven days would be the minimum safe time for it to set before the centering was struck. He thought that the bearing of the carriage girder of the sixth floor was so bad that a comparatively small weight would knock it off. The pier was built in Portland cement.—James Lillywhite, recalled, said on the day preceding the accident he was in the basement of the building, and his mate drew his attention to three cracks in the brickwork of the pier about 4ft. or 5ft. from the ground. The cracks were 7in. or 8in. long. The largest would admit part of a trowel.—Mr. C. J. C. Pawley, the architect, recalled, said the pier, which was to be 2ft. 3in. by 1ft. 6in., was to run up from the first floor level to the seventh floor—about 78ft. Provision was made in the basement for a stanchion. Detailed plans were prepared by Andrews, the builder's foreman. The dimensions of the pier being given as 2ft. 3in. by 1ft. 6in. was

THE RESULT OF A DRAUGHTMAN'S ERROR.

It was true that the plan was given to the contractor to work from. Witness designed the roof, and he considered himself responsible for the pier. The stanchion, though desirable, was not put in because the machinery occupied the space where the footings were to be. There was no room for it. He gave his assistant strict instructions not to allow the centering to be struck, having in his mind the possibility of an accident. He still thought the collapse was due to the falling of the concrete. He did not know the dimensions of the pier as constructed. He did not remember receiving a single complaint from anybody about the construction of the building or the materials. The witness had built many buildings similar to this. The inquiry further adjourned.

Professional Items.

AULDEARN.—The designs of Mr. John Robertson, ecclesiastical architect, Inverness, for the entire renovation of Auldearn Parish Church, have been approved of, and the successful contractors for the various works are:—mason work—Fraser and McIntosh, Inverness; carpenter work—William Brooman, Nairn; slater work—A. C. Fraser, Inverness; plumber work—John Stewart, Grantown and Nairn; painter work—John Campbell, Nairn; and heating—M'Kenzie and Moncur, Edinburgh. Auldearn Church was built in 1757, and is, says the statistical account, "still a substantial though an ill-constructed building. The length is quite out of proportion to the breadth, and the whole building affords a specimen of the little attention formerly paid in the erection of churches both to the acoustics of the building and the comfort of the congregation." According to the designs prepared by the architect and adopted by the Committee in their entirety, the church is to be entirely gutted out and renewed. The interior is to be designed in Early Gothic, both sides of the edifice being divided by a screen of moulded pillars on which will rest grained arches, with enriched main arched couples, filled in with tracery, the ceilings, being the main couples, being divided into panels by moulded ribs and enriched corbelled cornices. The reredos behind the pulpit is to be of a very rich character, with a series of arched and cusped recessed panels, divided by moulded buttresses, having traceried triplet gables with carved terminals over. Over the reredos is to be placed a traceried circular window to be filled in with stained glass. Both gables of the church are to be finished with a series of clustered pillars, over which will be grained arches to match those on each side of same. A Communion Table is to be provided, designed to match the character of the pulpit.

BANGOR.—A large number of private houses, principally villas, have just been and are about to be finished in various parts of the town, notably on Hamilton Road, Ballyholme Road, and Seaciff Road. Plots of ground have been taken on which houses are to be erected in time for next summer. A prominent inhabitant has secured an extensive plot on one of the best sites of the township, and it is his intention to erect a number of modern villas. Then a belfry and spire are to be erected on the parish church, and the work of construction of the new Hamilton Road Presbyterian Church has lately been commenced. The Governors of the Bangor Endowed Grammar School are at present engaged in the consideration of a scheme for the erection of new and more commodious school premises. Turning to public works, extensive sewers are at present being laid along Bridge Street and Sandy Row, and the thoroughfare is being considerably widened at a narrow part along the Seaciff Road. The work of laying mains for drainage purposes is about to be begun between Church Street and Brunswick Road under the railway line.

BEDFORD.—Mr. S. Foster, contractor, has just completed an Elizabethan mansion for Mr. W. H. Allen. It is built of Weldon stone and red local tile roof, while all the finishings inside are of oak, and special care has been given to the decorations. Stables, lodges, and lawn buildings have all been erected. The buildings are all lit with electric light, which is generated upon the premises. The whole of the buildings have been designed and carried out under the personal care and direction of the architect, Mr. George P. Allen, of Adelphi Chambers, Strand, W.C.

DEESIDE.—A large hydropathic establishment is to be erected on the north side of the Dee, about half a mile west of Murtle Station. The total cost is estimated at £12,000. Mr. Robert G. Wilson is architect, and the contractors are:—Mason—Mr. John Morgan, Aberdeen; carpenter—Messrs. Leslie and Hay, Aberdeen; slater—Mr. A. Kinkaid,

Cults; plasterer—Mr. George Leith, Aberdeen; plumber—Mr. A. B. Robertson, Aberdeen; painter—Mr. Edward Copland, Aberdeen.

DEWSBURY.—The foundation-stone has been laid of a chapel to be erected on the south side of St. Matthew's, Westtown. The addition to the church has been designed by Messrs. Holtom and Fox, architects, Dewsbury, and the style will be that of the main building. Some important buildings are about to be erected in Dewsbury. The structures include a bank, which will have frontages in Northgate and New Bridge Street, and is from designs by Mr. John Lane Fox, of Dewsbury. The elevation of the lower story will be of polished grey granite, and the two stories and attic above will be of ashlar from the Holmfirth quarries. On the east of this pile, occupying the north side of New Bridge Street, are to be erected several shops, the architects being Messrs. Holtom and Fox. The buildings will extend to Cloth Hall Street. On the opposite side of New Bridge Street Messrs. D. and W. Thornton are building a shop and workrooms, and near the east end of the same thoroughfare a large warehouse is in progress. A more important project is about to be undertaken by Messrs. Kirk and Sons, architects, for Mr. Knowles, viz., the erection of an arcade containing sixteen shops and offices, and extending from New Bridge Street to the Market Place. The plans are being considered by the Building Committee of the Corporation.

GLOUNTHAUNE.—The new parish church at Glounthaune (Queenstown Junction) is 102ft. by 22ft. 6in. wide; two aisles, 94ft. by 11ft. 3in., and a sacristy of good size, at the north side, thrown out from the main building, with a stairs approaching floor over same. The ridge of the nave is 45ft. over the floor of the church. The nave and aisles are separated by pointed arches of a high pitch, springing from octagonal moulded caps of Portland stone, resting on red polished granite columns and Portland stone bases. Over the arches are the clear strong windows arranged in couplets of quatrefoil design. To the right and left of the sanctuary are the side chapels, lighted by rose windows, worked in chiselled limestone. The side aisles have couplet windows of limestone with cupped heads. The main entrance doorway is directly under a canopy, which serves to emphasise it, and has a very bold appearance, the deeply recessed jambs of same having large double chamfers finished with pyramid stops, label mould to arch, terminating on moulded blocks. On the top of this gable is a limestone belfry, surmounted by a cross. The church will accommodate about 1000 persons. The architect is Mrs. S. Hynes, South Mall, Cork, and the builder Mr. J. Coffey, Middleton. The benches are the work of Mr. John Barry, Queenstown Junction, and the tiling was executed by Mr. Nicholas Sisk, Evergreen, Cork. The high altar is the work of Mr. Davis, sculptor, Cork. It is composed of Sicilian marble, variegated. In the chancel are three stained glass windows, the work of Lawes and Westlake, London.

HULL.—The foundation-stones of the new Congregational Church, which is to be erected on Princes Avenue, Spring Bank, have been laid. The new church is cruciform on plan, having a nave of 82ft. in length by 28ft. in width, with north and south transept 18ft. 8in. and 15ft. 6in. in depth respectively, and 23ft. 6in. in width. The buildings are designed in the late Gothic style, and the church will be seated so as to accommodate 585 persons on the ground floor and sixty-eight in the gallery.

HUNCOTE.—A new Sunday school is being erected in connection with the Baptist Chapel at Huncote. The preparation of plans was placed in the hands of Mr. F. Clarke, architect, of Leicester. The building is designed on a Gothic model, with a green-slatted roof; and the windows and doors are to be ornamented with dark red quoins.

LINCOLN.—The foundation stones of the new Sunday schools intended to be added to the Bailgate Wesleyan Chapel, Lincoln, have been laid. The architects are Messrs. W. Mortimer and Son, and Messrs. Halkes Bros. are the contractors.

LIVERPOOL.—The Great Central Railway Company has just opened its new receiving warehouse and offices in Hood Street. The warehouse has been constructed on the most modern principle, is three stories high, and has an excellent basement; it is fitted with hydraulic cranes, hoists, and all other necessary appliances for the speedy and safe handling of all kinds of merchandise; and is lighted throughout by electricity.

NEWCASTLE.—A large building scheme is contemplated here. The Northern Allotments Society has purchased two large building estates on the western confines of Newcastle—extending from the West Turnpike beyond the Workhouse right across to and including Fenham Hall, and further extending to and including the Mill Inn at Cowgate. On this elevated ground it is proposed to lay out a large building estate of better class houses and cottage villas. The most effective precautions will be made to render it one of the best built and pleasantest as well as healthiest suburbs of the city.

NOTTINGHAM.—Turkish Baths have been erected in Upper Parliament Street, Nottingham. The building is divided into two wings for ladies and gentlemen, each wing being approached by a separate staircase. The scheme of decoration, as well as the style of the building, is Moorish. The floors throughout are fireproof, and in the hot rooms and cooling rooms they are of vitreous glass Mosaic. The walls in the hot rooms, which are spacious and lofty, are of marble dado, surmounted by buff terra-cotta, and the cooling rooms are panelled in the style of the Georgian period. In the shampooing rooms the arrangements are contrived upon the most modern plan. There are heavy marble slabs, needle baths, showers, douches, and Russian steam baths, while the shampooing basins are of aluminium. The needle baths, which are, like the shower baths, recessed under Moorish arches, are provided with ascending and descending douches and descending showers. Sitz baths are also provided. At the top of the building is a steam laundry. The basement contains the boiler and engine room. Messrs. Brewill and Baily, of Nottingham, are the architects, while the fittings have been furnished by Messrs. Bradford and Co., Manchester.

PERTH.—New offices are to be built for the General Accident Assurance Corporation in Tay Street and High Street, Perth. The building will be one of the architectural features of Perth. The designs are by Mr. George P. K. Young, Perth. The ground floor will be almost entirely taken up by a large office of one apartment. On the first floor will be a lesser office for the use of the fire department and the manager's and directors' private rooms. On the third floor are additional clerks' rooms, typewriters' room, &c., lavatory and cloakroom accommodation being provided on each floor. The safes and storerooms, boiler, engine, and dynamo chamber will be in the basement.

PETERHEAD.—Plans of the new police buildings for Peterhead have been prepared by Messrs. W. Henderson and Son, architects, Aberdeen. The front elevation, facing Merchant Street, will be of red and light-coloured granite, with clean-dressed pilasters, shelf mouldings, cornice, and centre pediments, the base work being of rock-faced work, and the remaining parts of coarse-dressed work. In Tolbooth Wynd there will be an elevation, extending over 90ft., of hammer-blocked red granite. The main entrance is from Merchant Street, and it leads into the administrative department, where there are a charge room, waiting room, inspector's room, with a passage

to the cells, cloak room, and lavatory accommodation. Behind these are the muster room and quarters for four unmarried constables, comprising sleeping rooms for each and a kitchen for general use. There are seven cells—one of which is double—all lighted and ventilated in accordance with the requirements of the Prison Commissioners. The cells are to be lined to the height of 4½ft. above the floor with glazed bricks, to secure the utmost cleanliness. Lavatories are to be provided for the prisoners, and the cells will be heated by hot-water pipes from a boiler in the back court.

ROMFORD.—The Urban District Council of Romford, having decided to erect public swimming baths in Mawney's Road, Romford, invited designs from architects, and have selected for execution the design submitted by Messrs. Harrington and Ley, of 108, Fenchurch Street, E.C.

ROTHERHAM.—Four almshouses have been built on a site located off the Broom Road. In each there is a parlour, bedroom, larder, and scullery on the ground floor, while there is a washhouse common to all. Mr. J. E. Knight, of Rotherham, has been the architect, and Mr. S. L. Pilgrim, of Rotherham, the contractor.

SHEFFIELD.—The new Corporation baths for ladies in Glossop Road have been erected from the designs and under the superintendence of the City Surveyor (Mr. C. F. Wike). There is a spacious new swimming bath for the exclusive use of ladies, with thirty-five dressing boxes, ten slipper baths, and two foot baths. The swimming bath is 25ft. wide and 75ft. long, with a varying depth of from 3ft. 6in. to 5ft. 6in. It is lined with glazed white bricks, and the divisions between the slipper baths are of slate instead of wood. This is much better from a sanitary point of view, as slate can be thoroughly cleansed. The building is of brick with stone facings. At the Glossop Road end of the building there will be a large window of stained glass. The contractor for the building is Mr. George Webster, of Intake Road, whose contract amounts to about £5200. The heating and engineering work has been carried out by Messrs. Bradford and Company, Crescent Ironworks, Salford.

STARBECK.—The North-Eastern Railway Company propose to carry out additions and improvements at the passenger station at Starbeck. So far as the down platform is concerned, it is intended to slightly re-arrange the existing waiting rooms, to build a new first class gentlemen's waiting room, and to provide various other conveniences. On the up platform it is proposed to do away with the existing buildings, and erect a new booking office, new waiting rooms, ticket collectors' and porters' rooms, &c. Additional shelter will also be afforded passengers by extending the roofing over each platform to 200ft., and a portion of the platform on the down side is to be increased in width by 12ft. to make it correspond with the remainder of the platform.

WREXHAM.—The foundation stone of a Congregational chapel being built here has been laid. The plans were prepared by Messrs. Ingall and Son, the contract being secured by Messrs. Lewis Brothers, of Wrexham. The whole of the buildings occupy a commanding site at the junction of Salisbury and Percy Roads. The organ and pulpit will be placed in an apse at the end of the chapel, where are also placed the minister's and deacon's vestries and a kitchen. The chapel will be heated with low pressure hot-water pipes, and effective ventilation is being provided for. The wood work and open roof timbers will be pitch pine and best red deal, stained and varnished, and the building, which is of simple Gothic design, will be faced with Ruabon brick and stone dressings. The building will be surmounted by a tower and spire, rising to a height of 80ft.

Under Discussion.

LIGHTING OF THE HOUSES OF PARLIAMENT.

A limited number of the members of the Civil and Mechanical Engineers' Society were invited, a few days ago, to inspect the lighting and ventilating works of the Houses of Parliament. The members present were: Mr. Herbert Coward (president), Mr. Cooper Penn, Mr. Twelvetrees, Mr. W. M. Binny, Mr. Booth, Mr. T. C. Walrond, Mr. Hanssen, and Mr. Percy Field. The members were conducted over the various departments by Mr. Palfreeman, resident engineer.

NORTHERN ARCHITECTURAL ASSOCIATION.

The members of this Association held an excursion meeting on Saturday, May 21st, when the following buildings were visited: Sandford Board Schools; Grand Theatre, Heaton; Raby Street Board Schools, and the adjacent Presbyterian Church.—The Council announce that the usual prizes will be given for drawings made during the summer of this year by students and associates (not in practice), and who have not attained the age of twenty-five years: a first prize of £2 2s., and a second of £1 1s., for the best set of measured drawings; also a first prize of £2 2s., and a second of £1 1s., for the best set of sketches.

BRISTOL SOCIETY OF ARCHITECTS.

The last ordinary meeting of the Bristol Society of Architects for the present session was held at the Fine Arts Academy, Clifton, when a paper on "Plumbing," by Mr. George Tuckey, was read by the President.—The conditions of competition and instructions to students for prize drawings were read, and it was decided to print the same for circulation, together with a letter received from the Principal of the Merchant Venturers' Technical College, stating that it was proposed to hold a special course of lectures for students desirous of presenting themselves for the intermediate examination of the R.I.B.A.

EDINBURGH ARCHITECTURAL ASSOCIATION.

The annual meeting of the Edinburgh Architectural Association was held in the Royal Institution, Princes Street, Mr. Thomas Ross, the President, in the chair. The report of the Treasurer showed that the total membership of the Association stood at 286, that the total income for the year amounted to £135 10s., and the payments to £132 4s. 11d.—The Secretary stated that in connection with the memorial which they had presented to General Sir E. Murdoch Smith, suggesting that the Museum of Science and Art might remain open between four and six o'clock on Saturday afternoons—which two hours would be very useful to architects, artists, and others for sketching purposes—he had received a communication from Sir Murdoch Smith to the effect that he had submitted the memorial to the Lords Committee of Council on Education, with a recommendation that the request therein set forth be acceded to.—The President intimated that the Hon. Hew Dalrymple, on behalf of the Ayr and Galloway Archaeological Association, had presented the Association with a set of their proceedings, amounting to fourteen volumes, an extremely valuable gift.—Mr. Ross was re-elected president; Messrs. John Watson and James Bruce, W.S., were re-elected vice-presidents; and Messrs. T. Fairbairn, A. Hunter Crawford, and J. Johnston, C.A., were re-elected secretary, excursion secretary, and treasurer respectively.—The President afterwards delivered an address, the subject of which was "Lesser Known Churches of Scotland." Mr. Ross, whose address was illustrated by limelight views, began with the earlier Norman churches, such as Leuchars, Dalmeny, and Tynninghame; next he directed attention to the elaborate church towers at Dunning, Muthill, and elsewhere in the district of the Tay; and dealing, lastly, with later churches, Mr. Ross gave a full exposition of the colle-

giate churches, of which he said there were somewhere between thirty and forty in Scotland, and which were all in the late Scottish Gothic style, and were perhaps the most national works they had, without any affinity whatever to English work.

NATIONAL ASSOCIATION OF MASTER PLUMBERS.

The annual meeting of this Association was held at the Town Hall, Derby, when Mr. J. Beal, of Hull (the president), occupied the chair, and there were delegates present from London, Manchester, Newcastle, Oxford, and elsewhere. The Mayor of Derby (Mr. Ald. Duesbury) welcomed the members to Derby, and said the objects of the Association were very laudable. One of them was to assist people to live happily and comfortably amidst good sanitary surroundings. In this age of progress, when sanitary science was developing so rapidly, higher things were aimed at, and very good work was being done by the plumbers of England. Twenty years hence people would look upon very different plumbing even to that done now, such was the progress of the trade.—The President, in his reply, said that one aim of the Association was to meet the operatives engaged in the business, and, if possible, to avoid strikes and disputes. Subsequently, in his presidential address, he said that although much had been done by the Association, a great deal more remained to be accomplished, and energy, skill, and self-sacrifice would have to be expended before they had secured all that they wanted. He condemned the system of municipal competition in trade, and the merchants selling to outsiders, and said the relations with the operatives were very satisfactory. There had been a few disputes reported, but in nearly all of them the Association had been successful in obtaining amicable settlements.

THE Rotherham Corporation has applied for sanction to borrow £4000 for the purpose of erecting public baths.

A NEW Baptist Chapel is being erected at Scapegoat Hill, Golcar. Mr. Joseph Berry, of Huddersfield, has prepared the plans.

LORD MASHAM has offered to place at the disposal of the Mayor of Bradford the sum of from £30,000 to £40,000 for the purpose of erecting an institute on the site of his old home in Manningham Park, Bradford, which is now public property.

Views and Reviews.

"CHURCH ARCHITECTURE."

This little work—which is of pocketable size—is a simple treatise on the rudiments of Church Architecture from the Roman period to the middle of the sixteenth century. The author has especially striven for simplicity, "so that the young may readily grasp a general outline of one of the most interesting subjects of history." The booklet attains this object admirably, the more so as the letterpress is aided by a series of simple illustrations, which will be found of great service to the reader new to architectural study. After dealing with the architectural styles of the period under review, i.e., Norman, Early English, Decorated, and Perpendicular, the author devotes to each subject a chapter on bells, chancels, rood screens and roof lofts, fonts and pulpits. "Church Architecture," its pretentious title notwithstanding, concisely and comprehensively outlines an extremely interesting subject.

"Church Architecture from the Roman period to the Middle of the Sixteenth Century." By C. B. Fowler, F.R.I.B.A., Cardiff. London: Iliffe and Son, 3, St. Bride Street, E.C. Nutshell series, 6d.

STAGE CONSTRUCTION.

Mr. Edwin O. Sachs has decided to issue a large folio volume, entitled "Stage Construction," on the occasion of the impending Wagner Cycle at Covent Garden, when so many of the Bayreuth methods and appliances will be in use. The increased general interest in the mounting of plays, and the equipment of the stage generally, is the reason for the immediate production of what will practically be a supplement to Mr. Sachs' greater work, "Modern Opera Houses and Theatres," even prior to the issue of the concluding volume of that monumental publication. "Stage Construction" will be profusely illustrated with some 200 drawings, sketches, photographs, and diagrams from the leading stages of Europe, and thus the great stages of the Opera House at Paris, Vienna, Berlin, Budapest, Amsterdam, Christiana, or Munich, as the case may be, will be equally as well represented as the leading stages of the metropolis. In the introduction to the book Mr. Sachs will primarily deal with Scenic Art and the various developments of stage equipment. Mr. B. T. Batsford will again be his publisher.

KEYSTONES.

NEW Council Offices have been erected for the Hebden Bridge Urban District Council.

THE demolition of some of the houses in Church Row, Hampstead, a fine thoroughfare with many literary and artistic associations, has been commenced with the view of the erection of flats on the site to be cleared.

THE London County Council have given an official notification of the withdrawal of their Bill to construct tramways in the Holborn district, in Clerkenwell, Islington, Bloomsbury, Shoreditch, and Bethnal Green. The estimated cost of these extensions was £32,000.

THE directors of the Cardiff Railway Company have considered the tenders for the construction of the new dock on the foreshore at Cardiff, and have decided to accept that of a firm having local connection, though it was not the lowest tender sent in. Certain matters of detail, involving alteration in the specifications, have still to be formally settled. The construction will occupy four years.

PRINCESS CHRISTIAN opened last week Eton House, erected in connection with the Church of St. Mary, Eton, in Gainsborough Road, Hackney Wick, at a cost of £4500. The house has accommodation for nine resident clergy, and is intended for the use of the clergy and old Etonians working in the parish. The building contains twenty-six rooms, including a dining and common room and the private apartments of the residents. An organ has also been erected in the house at a cost of nearly £1000.

SUPPLEMENT FOR

SURVEYORS · BUILDERS · SANITARY ENGINEERS ·

MAY 25TH, 1898.

Builders' Notes.

THE new north block of Admiralty buildings is making very rapid progress. It has attained more than half its full height, and this summer will probably see the work well through. It is just about as large as the other one, but is somewhat simpler in construction, and will cost less. It will be less elaborate in its external decoration, and the interior of it will consist mainly of a comparatively few large rooms for the accommodation of clerks, whereas the first block comprised a good many smaller rooms, some of them of an ornate character and designed for the higher officials of the service. But though many of the rooms will be large—one of them designed for four hundred men—the new structure will comprise no less than about a hundred rooms altogether. When this building is completed there will be a fine transformation effected at this corner in Spring Gardens. At the present time the old buildings and the passages and covered ways connecting the various departments of the Admiralty constitute one of the most intricate and bewildering mazes imaginable.

In the Queen's Bench Division, Dublin, before the Lord Chief Justice, Mr. Justice O'Brien, and Mr. Justice Gibson, judgment was given in the case of *Antisell v. Doyle*. The action was to recover money claimed to be due for work done in connection with the building by the defendant, Mrs. Doyle, of eight houses in Blackrock. The defendant employed Mr. Beardwood to prepare plans and specifications and invite tenders. Mr. Beardwood employed Mr. Antisell, the plaintiff, to make out quantities, and to send out bills of quantities to builders from whom tenders were invited. The case was tried before Mr. Justice Madden and a common jury, to whom the learned judge left the following questions:—Was the employment of the quantity surveyor within the scope of the architect's authority? was that employment ratified by the defendant? was there a limit of authority to the extent of £6000? and was there a custom empowering the architect to employ a quantity surveyor without asking the assent of the intending building owner? The jury answered all these questions in favour of the defendant; but Mr. Justice

Madden, being of opinion that the verdict was against the weight of evidence, declined to give judgment for the defendant. The case came before the Divisional Court on a motion by the defendant for judgment, and a cross motion by the plaintiff that the verdict should be entered for him or for a new trial.—Mr. Justice O'Brien now gave judgment in support of the findings of the jury, holding that it would be monstrous that a person should be called on to pay for the services of another of whom he never heard, and the nature of whose business was to inflate the amount to be paid.—Mr. Justice Gibson concurred, saying that the evidence pointed rather to a practice or habit than a binding custom such as that alleged. The defendant was not liable to the plaintiff, whoever else might be.—The Lord Chief Justice said in his opinion this case should be tried again. His learned brothers, however, thought that judgment should be for the defendant, and it would accordingly be given for her, and she would get the costs of the trial and of the new trial motion.

At the Worksope County Court, before his Honour Judge Masterman, William Hemstall, builder, Worksope, sued James Pilsworth, plumber, Worksope, for £64 17s. 8d., for work done and building materials supplied. There was a counter-claim for £52 for compensation for damages sustained by delay and work unsatisfactorily done. After hearing the evidence, his Honour said the whole of the difficulty had arisen from defendant's non-economical principle of not employing an architect. If he had employed Mr. Allsopp in the ordinary way he would not have made the payments on account without an architect's certificate. The architect would certainly have stopped any work that had been wrongly or badly done. He had come to the conclusion that the defendant had established £10 of his counterclaim, which must be deducted from the plaintiff's claim. He found judgment for plaintiff for the amount claimed, and on the counterclaim gave a verdict for £10; plaintiff to have the costs of the action.

THE Lynton and Barnstaple Railway, just opened, is constructed with a gauge of only 2ft., the same as that of the Festiniog and the North Wales narrow gauge lines. The line starts from the existing passenger station of the South-Western Company, and before it gets out of the town crosses two streets on the level, but all the other roads in its course, and there are over twenty of them, are crossed by bridges in the orthodox manner.

No sooner is it outside the town than the railway commences to rise from the valley of the Yeo on a steady gradient of 1 in 50, till near Parracombe, an elevation of 1000ft. Thence it descends on the same gradient to a terminus just outside Lynton, on the face of the hill looking down into the valley of the Lynn. Needless to say, in such a country the curves are frequent and sharp, and the banks and cuttings numerous and heavy. There is, moreover, one viaduct 50ft. high and 100yds. in length. The total cost of works, buildings—there are six stations, all of them substantial stone structures—and permanent way, ballasted and laid with 42lb. rails, is well under £60,000 or about £3000 per mile.

THE contracts for the railway projected by the Callander and Oban Company between Connel Ferry and Ballachulish have been concluded, and it is expected that the active construction of the line will be proceeded with immediately. The work of the permanent way has been secured by Mr. John Best, contractor, Leith, and the erection of the bridges that are necessary is entrusted to Arrol's Bridge and Roofing Company Limited, Glasgow.

THE St. Pancras Vestry has obtained satisfactory concessions from the London and North-Western Railway Company, in consideration of withdrawing opposition to the Company's Bill before Parliament, which sought, among other things, to acquire eleven acres of land on the south-west side of the Company's railway at Hampstead Road, near its junction with Granby Street, along one side of Mornington Road to Mornington and Delancey Streets, and bounded on the other side by Regent's Canal. This area embraced the greater portion of Park Village East. The Company, at the instance of the Vestry, agree to modify their scheme in several respects. They will not now acquire any of the houses on the west side of Park Village East. The land to be taken on the west side of Mornington Road is, it is said, solely for the purpose of strengthening the retaining wall on that side of the existing railway. Hence only a few feet of garden ground will be absorbed, the houses fronting the road being left undisturbed. The Company agree to construct and maintain a bridge over the railway from Mornington Street to Park Village East, of a width of not less than 45ft. No existing thoroughfares are to be closed until the new bridge is open to traffic. A block of property to the south of Mornington Place is to be utilised for rehousing the workmen displaced by the scheme.

Clayworkers at Copenhagen.

BY ONE OF THE PARTY.

DURING the Easter holidays forty-five members of the Clayworkers' Institute made Copenhagen the centre for their annual spring visit. These foreign trips were started last year by Mr. Greville Montgomery, the proprietor of the British Clayworker, the first visit being to Belgium. This year our brickmakers have gone further afield, and their journey to the northern capital was a complete success. The object was to make the trip recreative as well as instructive, and the main part of the journey was therefore by water. A new Danish boat, "The Fjord," was chartered to convey the party to Esbjerg and back from Harwich, a journey which occupied some twenty-five hours each way. Excellent weather prevailed on both outward and homeward journey, but the intervening days were chequered by constant showers and cold winds. From Esbjerg the trip across the two stretches of water would have been delightful had the elements been propitious—as it was, there was little to be seen for mist and rain. After a long train journey from Korsør, Copenhagen was reached in a thunderstorm, and it was a pleasure to receive the cheerful hospitality of the proprietors of the Hotel d'Angleterre, who placed the big dining hall at our disposal, and in every way laid themselves out for our comfort. At dinner Mr. Montgomery introduced the company to different members of

PART OF ROYAL PALACE OF AMALIENBORG.

would not have disgraced a royal garden party. On the journey back, a visit was paid to

Hamlet's Tomb and the Castle of Cronborg, which gave a little touch of sentiment to an otherwise somewhat prosaic programme of sight-seeing. On Monday, after dinner, we packed off to Odense, a town just halfway to Esbjerg, making the new and now principal hotel—the Grand—our headquarters for the night. The following day, wagonettes conveyed us to a neighbouring brickyard, where were seen the most up-to-date and labour-saving appliances in the country. Back to the hotel, luncheon,

was a complimentary dinner given to Mr. Montgomery on the boat, and the presentation to him of a piece of plate as a memento.

Although dating from the twelfth century, Copenhagen contains few old buildings owing to the extensive fires to which it has been subjected. The drainage system is very unsatisfactory, being difficult to deal with on account of the low level of the ground. The streets are mostly paved with cobbles, but one or two of the important ones are laid with asphalt or wood. The city is lighted by electricity.

A noticeable feature of the buildings is the exaggerated tuck pointing, which is adopted in combination with the English bond; another is the glazed tiles, which are largely used, giving the roofs the peculiar appearance of always being wet; the steepness of the roof adds to the picturesqueness of the buildings.

The most important buildings embrace the present Royal residence, "Amalienborg," situated in the northern part of the city, and consisting of four smaller palaces, originally built by rich noblemen, but acquired by the King after the destruction of Christiansborg in 1794. In the middle of the open space enclosed by these palaces is a bronze statue of Frederick V. Of the four palaces one is inhabited by the King, one by the Foreign Office, one by the Queen Dowager, and one by the Crown Prince. The National Theatre, of which we give an illustration, was erected in 1874, and is situated in Kongens Nytorv.

The Vor Fru Kirke, a modern structure in the form of a Roman basilisk, was built in

THE OPERA HOUSE.

the firm of Messrs. Smidth and Co., the leading brick and cement engineers on the Continent. This firm have undertaken the construction of many of our largest cement plants in this country, and there are few firms in that trade that do not use some machinery of Messrs. Smidth's manufacture. And now let it be said that to the courtesy, diligence, and patience of the members of this firm the main success of the outings in Copenhagen were due. They organised our receptions and our luncheons, and generally stood sponsors for the Danes in showing hospitality, good feeling and brotherliness, towards their blood relations.

On Sunday, such of the party as felt inclined visited Hedehusene—the house on the moor—a village some 15 miles out, where they examined the details of a very excellent brick plant. Monday formed the principal day of outing, the party proceeding first thing by train to Elsinore. Here carriages were in waiting, and a drive of some 15 miles was encountered in order to reach the Dronningmølle brickworks, where the party was handsomely received and treated by the proprietors. An elaborate typical Danish lunch was in readiness with a profusion of good things that

and away to Esbjerg, amid the deafening cheers of Danes and Britishers.

No holiday could have been more enthusiastically carried through than this. Its very jollity was infectious, it went with a swing and verve that allowed no moment for disaffection or complaint. And if evidence were needed of the satisfaction of every individual member of the party, it was to be found in the oft reiterated remark that the trip was in every detail too short.

A pleasing feature of the outing

WINDOW DECORATION IN TERRA-COTTA.

PORTICO OF VOR FRU KIRKE.

1829 by Hansen, and is beautifully ornamented by sculpture by Thorwaldsen. The tympanum of the Doric portico is decorated with Alto relievo in terra-cotta representing John the Baptist preaching in the wilderness.

The Exchange is situated on the Castle island, and is a red building in Dutch Renaissance, with casements and sculptured ornaments of grey sandstone. A curious tower rises from the centre of the building, the spire of which is composed of the tails of four dragons twisted together; the heads of the dragons being turned to the four points of the compass.

Trade and Craft.

MESSRS. GEORGE WRIGHT AND CO.

This well-known firm of ironfounders, whose works are at Rotherham, have an excellent sample stock of mantelpieces at their London showrooms, 155, Queen Victoria Street, Blackfriars. In recent years these necessary adjuncts to the completion of the house have been vastly improved, and now, instead of the ordinary plain-looking fireplace, we have the artistic arrangement of the overmantel, in

walnut, oak, or mahogany, made to harmonise with the general character of the surroundings. In their catalogue Messrs. Wright and Co. show several pretty designs of these overmantels. One is a fine mantel with Carton Pierre enrichments, the overmantel having three bevelled mirrors. Other designs are equally attractive. The firm also supply mantelpieces in marble, slate, and iron, the large number of illustrations of these showing that they are prepared to meet all requirements as to size, shape, design, &c. Tile work, which is now very popular for stone decoration, is a speciality of theirs, whilst another feature is their stock of grates and stoves of both ancient and modern description. As manufacturers of kitchen ranges, Messrs. Wright and Co. offer a varied list for selection, the self-setting portable and the improved self-acting cottage ranges calling for attention; whilst of kitcheners, their "Gold Medal Range" is specially recommended. Their extensive experience fully qualifies them to give advice, and the article in their catalogue, "Directions for Fixing Kitcheners," with diagrams, will be found of great service. Messrs. Wright and Co., besides being manufacturers of fireplaces and all the requisites connected therewith, make steam cooking apparatus, stable and agricultural buildings fittings, pavement, basement, and floor lights, &c.

A STAIR-TREAD NOVELTY.

We have seen at Messrs. W. B. Wilkinson and Co.'s offices in Newcastle a new device for the avoidance of the slipperiness which is such a nuisance, to say nothing of the danger, in cement staircases. Indiarubber studs, being threaded for the purpose, are inserted in the concrete when in a soft state. These form a safety tread of no small ingenuity; and it is well known that good rubber is very durable. But these studs, as they wear, can be renewed by simply unscrewing, and so bringing up the rubber again to its proper place on the tread. This patent arrangement should be of great service where the safety of the step is of prime importance, as in schools, &c., though, for that matter, safety is everywhere important in a stair.

NATIONAL THEATRE, COPENHAGEN.

DESIGN & DETAIL OF DOMESTIC BUILDING.

By JOHN E. NEWBERRY, A.R.I.B.A.

II.

I NOW propose to give some practical hints on the design and detail of a brick house with sash windows, the frames of which are to show. Such a building is probably the most suited to modern requirements of any that are to be discussed in this series, for the rooms may be lofty and the windows are of the type usually most approved. The plan of such a house should be symmetrical to some extent and the roofs simply treated, hips being more suitable than gables. Dignity and elevational effect should be obtained by plain masses of wall surface and the proportions of the window openings. Shadow and richness should be confined to the crowning cornice and the doorways. Good colour must be sought for by a harmonious choice of materials, the paint of the woodwork and perhaps a judicious selection of the material used for roller blinds.

The former remarks on materials will apply throughout this series. The details show a brick treatment, but in a stone district ashlar facing would naturally be preferable.

BRICK FACING.—Hand-made bricks of a good red colour form an excellent facing, especially if one can afford to have the arches, jambs and sills of cut and rubbed brickwork. In default of this, neatly axed arches and plain stone sills will still look well. Or, if red bricks are difficult to obtain or too expensive, a facing of "washed stocks" of a dark yellowish-brown colour are by no means a bad substitute for red facings. In any case I should be disposed to have the pointing in white mortar with struck weathered joints.

ASHLAR FACING, such as one sees in some of our later Renaissance houses, is very charming in a stone country. An example that I well remember has plain lintels to the sash windows and flush sills, the moulded work being concentrated in the eaves cornice, a string course at first floor level, and the doorway.

ROOFS.—The roof covering should harmonise or contrast well with the facing of walls. For red brick, green slating forms the best contrast, but the slates should be thick and not too smooth. The size known as "Ladies,"

16in. by 8in., gives more "scale" to a building than the ordinary large "Countess" slates. A red tile ridge looks cheap to my mind, and out of place; plain lead forms a far more suitable termination to a slated roof. But for the hips in best work, I would advise their being close cut, with a small secret lead gutter on the angle underneath the slates. It is desirable that the pitch should be a good one, say 45deg., as this enables the roof to be utilised with convenient attics.

DORMER WINDOWS constructed of wood are suited for our subject, either flat topped or treated as pediments, curved or straight. The tops and cheeks would be covered with lead.

CHIMNEY STACKS.—In the best work nowadays one generally finds these features quite simply treated. The sketch elevation shows a moulded stone capping 9in. deep, with a 6in. moulded band lower down. In larger chimneys a good effect may be obtained by breaking up the stack with small pilasters 9in. wide, and of very slight projection.

EAVE'S CORNICE.—This feature is of the utmost importance in our design. It may be of wood painted, or rubbed brick, or moulded stone. The detail shows a wooden treatment with a sunk lead-lined gutter in it. The rafter feet and bearers notched on to the wall-plate should give ample fixing, and the large tilting piece, nailed to back of rafters, gives additional strength to the upper part.

In the old examples of rubbed brick eaves' cornices, one generally finds them surmounted by a brick parapet, but in modern work, to avoid the parapet, a usual method is to make the upper member of cornice a cast-iron ogee rainwater gutter. This is not satisfactory, as it neither can nor should be painted to imitate brick. There is also a difficulty in arranging the falls. If a brick cornice with iron gutter is to be adopted, a good method is to design a

CORNICE AND RAIN-WATER HEAD

complete cornice in brick and let the iron gutter stand back some 3in. or 4in. from the face. The gutter should be of a square section, with a small fillet or bead on the outer edge, and it might be painted some low-toned colour so as neither to hide the fact of its being iron, nor yet to produce too great a division between the cornice and roof covering.

A stone cornice is doubtless the best and most monumental termination; a curved sunk gutter should be formed in it lined with lead, with lead pipes leading to rainwater-heads as in the wooden example. Care must be observed that the stones have sufficient "tail," and are large enough to prevent any tendency to topple over. They should have cement plugs in the joints, and might be dowelled in the beds with 1in. slate dowels.

WINDOWS.—An ordinary sash window is not a pleasing feature, consisting, as it so frequently does, of a single large sheet of glass, or worse still, divided by a vertical sash bar. But it is the most practical window for modern purposes, being easier to clean than a series of casements, and affording better ventilation. In the detail the full width of the frame is shown, and it is set back only 2½in. from the face of wall; the frame is built in and a moulded fillet bedded in white lead screwed on after. The reveal being of rubbed brick, this forms a thoroughly watertight joint. Another method which still shows more of the frame than usual is to build it in a 2½in. rebate instead of the ordinary one of 4½in. Yet another is to expose the whole of the frame and set it in a 9in. reveal with a 2½in. rebate on the inside. With a sash frame of the ordinary size, this leaves 2½in. from the face of wall to frame, which may be finished with a moulded fillet planted on as shown on detail. Particular care should be taken to design sash windows so that the sash bars divide them into oblongs of a good proportion. They should be of a somewhat greater height than width. The thickness of the bars is also of importance, and should not be less than 1½in. Some architects make them as wide as 2in. with good effect. Points to be observed in detailing a sash window are: The pulley stiles should not be less than 1in. or 1½in. in thickness, the parting bead should be of oak and continued across head to prevent draught; a deep bottom bead, tongued to sill, will allow of ventilation between the meeting rails when the lower sash is raised a couple of inches; deal parting slips, or zinc pendulum slips, between the weights should never be omitted. The sill, which may be of oak or teak, should be bedded on the lower sill with white lead, and if a stone sill is used a galvanised iron tongue, 1½in. by ½in., should be inserted in grooves formed in the wood and stone. The

LIBRARY

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

rubbed brick sill shown on detail is intended to be protected with a sheet of 5lb. lead, taken under wood sill, turned up on the inside, and nailed with copper nails. Moulded horns to the upper sash are unnecessary, unless its width is greater than its height; they then help to steady the sash and prevent it from jamming in the frame.

THE ENTRANCE DOORWAY is capable of being treated in an endless variety of methods. For

DETAIL OF WINDOW JAMB

instance, in a brick house it may have fluted pilasters on either side, with entablature and pediment over, all in wood, painted. The door should be kept on the inside face of wall to give a good shadow to the opening. It should be an ample width, and might be divided into six or eight moulded and raised panels, the jambs and soffit of doorway being panelled to match. Or, if shelter is required, an over-

hanging porch is suitable. If the ground floor rooms are sufficiently lofty, a semi-circular fanlight over the door might be inserted, a much better expedient for lighting the hall than putting glazed panels in an outside door.

In a stone house there is still greater opportunity for a rich treatment, and appropriate heraldic emblems may be carved in the pediment. But carving should always be introduced with caution, and one must remember that only the best is worth having. This means employing an artist to do the work.

RAIN WATER HEAD.—A very simple head is shown on the cornice detail, and could be entirely made from 8lb. sheet lead. I would always rather use a plain lead head than an ornamental cast-iron pattern, as they last and look so much better. The rain water pipe may be of cast-iron, though, if funds will allow, lead is again much to be preferred. A square section—say, 4in. broad by 2 1/2 in.—looks well, and is large enough. Down pipes are often most useful vertical lines in an elevation if put in the right places.

PAINTING.—The colour of the external woodwork one would naturally have painted white or some shade of it, toned down, perhaps, with a little raw sienna or umber. The entrance doors might be a darker colour, such as fig green where there is brick facing, or vermilion in a stone house.

THE annual meeting of the members of the District Council for Edinburgh and the East of Scotland of the National Registration of Plumbers was held at Edinburgh. Sir James Russell presided, and said the Plumbers' Registration Bill, as they had heard, was very greatly improved, but, alas! the prospects of a private Bill in the session were extremely bad, and he supposed this Bill had just to be kept on the House of Commons table until it was passed. There was not much prospect of seeing it through this session, though it might by chance get into a better position. Every year that the Bill had been shown to the House it had been a better Bill. The constant

criticism and hammering it had received was improving it, and it was quite possible that the people who were longing for the Bill were seeing their own way more clearly, so that possibly this was no time lost. It was, however, an unfortunate thing for the public health, not to speak of the plumbing craft, that its passage through Parliament was so difficult. Nothing but the general education of the public, he supposed, had ever led to the passing of any Bill relating to public health. Legislation affecting public health was looked upon by the older school of people as an infringement of the rights and liberty of the public. Even if they got a Registration Bill which was not quite perfect, it would be a great help.

BUILDERS' ENQUIRY DEPARTMENT.

LEAD OR ZINC SOAKERS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—What should be the length of lead or zinc soakers to be used with Countess slating and with plain tiles? Should the former be 20in. long and the latter 10in., the same as the slates and tiles respectively, or would they do of less length?—Yours, etc.,

D. F. S.

The soakers not intended to be visible when the roof is finished must be kept short enough

FIG. 1.

FIG. 2.

to be covered by the tail of slate or tile above. The required length may be found by deducting the margin, or exposed portion of the slate, from its length, and adding 1in. for clip—e.g., length of Countess slating 20in., minus 8in. margin plus 1in. clip = 12in.; length of lead required, width 7in. Fig. 1 is a section showing soakers *in situ*, with step flashing, which may be cut in the soaker if desired. Fig. 2 is a perspective view of soaker ready for laying.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERDEEN.—Accepted for erecting a new hydro, Martle, Aberdeen. Mr. E. G. Wilson, architect, 181A, Union-street, Aberdeen.—

*Accepted.

WEMBLEY, MIDDLESEX.

A number of IMPORTANT FREEHOLD BUILDING SITES, comprising portions of the highly favoured Building Estate known as "HARROWDENE," about three minutes' walk from Sudbury Station, on the L. and N.W.R., and about one mile from Wembley Park Station, on the Metropolitan and District Railway. The plots all occupy capital positions on the rising ground to the west of the first-mentioned railway, and possess GOOD FRONTAGES TO THE HARROW-ROAD, the Harrowdene-road, and Crawford-avenue, with depths varying from 200 to 300 ft. The Estate is laid out with 50 ft. roads, planted with trees, and provided with means of lighting; house connections are laid; gas and water mains are put in throughout; and the carriage-ways have been taken over by the Local Authorities. The best of the sites are eminently suitable for the Erection of Residences ranging from £60 to £100 per annum, whilst others are intended for Villas with rentals of from £35 to £40 per annum.

MESSRS. WALTON and LEE will OFFER the above for SALE by AUCTION, at the Public Offices, Wembley, on THURSDAY, JUNE 23rd, 1898, at SEVEN o'clock p.m. precisely. Particulars may be obtained of Messrs. FLAGGATE and Co., Solicitors, Craig's Court, Charing Cross, S.W.; or of the AUCTIONEERS, at their Offices, 10, Mount-street, London, W.

THE SOCIETY OF ARCHITECTS.

Founded, 1884: Incorporated, 1893.

A GENERAL MEETING of the Society of Architects will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on THURSDAY, MAY 26th, 1898, at 8 o'clock p.m., when Mr. C. DAVIS, Chief Librarian of Wandsworth Free Public Library, will read a paper on the subject of LIBRARY CONSTRUCTION AND ARRANGEMENT, which will be illustrated by the lantern.

ELLIS MARSLAND, Hon. Sec.
MONTAGU BALDWIN, M.A., Sec. 1

ARCHITECTURAL INSTITUTE and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, personally, or in residence. Fourteen first places.—G. A. T. MIDDLETON, 19, Craven-street, Strand, W.C.

PERSPECTIVES Artistically Prepared. Terms moderate.—G. W. C., 46, Lincoln's-inn-fields.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

GOOD PLASTERERS WANTED at once. —Apply J. HILTON, 37, London-road, Lynn, Norfolk.

VACANCY occurs in a North of England Office for a very well-educated, gentlemanly YOUTH as PREMIUM PUPIL.—Apply, Box 708, BUILDERS' JOURNAL Office.

WANTED, thorough competent BUILDER'S CLERK for Country Office.—Apply, J. L. and H. STEER, Builders and Contractors, Clyst St. George, Exeter.

WANTED, for a permanency, in the office of a firm of Civil Engineers in the provinces, an experienced ARCHITECTURAL ASSISTANT, with some knowledge of engineering construction, well up in details and quantity taking, and with some experience in surveying and leveling.—Apply, stating age, experience, and salary required to Box H, Office of the BUILDERS' JOURNAL.

HARPER ADAMS FOUNDATION. NEW AGRICULTURAL COLLEGE AND FARM BUILDINGS.

The Governors of the above are prepared to receive APPLICATIONS for the appointment of a CLERK of WORKS to superintend the erection of a new Agricultural College and Blocks of Farm Buildings, Workshops, &c., at Edgmond, Newport, Salop, at a salary of £3 3s. per week, and unfurnished rooms on the premises, if desired.

Applications in writing (accompanied by copies of three recent testimonials from known Architects), and endorsed "Clerk of the Works," must be delivered at my office on or before JUNE 2nd. Possible duration of engagement 18 months.

C. R. LIDDLE,
Newport, Salop. Clerk to the Governors.

APPOINTMENTS WANTED.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES to ASSIST others in the PREPARATION of DRAWINGS at his own office. G. SCORER, 28, Newman-street, W.

YOUNG GENTLEMAN seeks APPOINTMENT as DRAUGHTSMAN. Neat and accurate tracer and colourist. Also office experience.—J. A., 10, Granville-road, Stroud Green, N.

TWO DRAUGHTSMEN, with ten years' London experience in libraries, schools, warehouses, hotels, &c., and all constructional details, are prepared to ASSIST ARCHITECTS at own home.—Box 722, BUILDERS' JOURNAL Office.

ARCHITECT and SURVEYOR'S ASSISTANT, A.R.I.B.A., desires RE-ENGAGEMENT. Ten years' experience of good work.—"Hurstmonceux," BUILDERS' JOURNAL.

ARCHITECT'S ASSISTANT desires ENGAGEMENT. Ten years' experience. Working and detail drawings, specifications, perspectives, competitions. Excellent references.—S., 98, Blenheim-crescent, London, W.

ASSISTANT DISENGAGED. Working, detail and contract drawings. Thoroughly practical designer. Surveyor and leveller. Could assist with quantities. Aged 24.—E. H., 66, Norroy-road, Putney, S.W.

CHICAGO EXHIBITION.

HIGHEST AWARDS.

ALBION CLAY COMPANY LIMITED.

SOLE MANUFACTURERS of the

"GRANITIC STONEWARE" Pipes.

TRADE MARK.

All the "Granitic Stoneware" Pipes are made from "Stoneware" Clays, of which we are the Sole Proprietors. The Clays are carefully selected and blended to insure a hard, dense, **impervious and imperishable** body, specially adapted for **Sanitary** purposes. The Pipes have a "**toughness**" as opposed to "**brittleness**," which is not possessed by any other Stoneware Pipes. They have been proved to withstand the highest crushing and bursting pressures under tests by Kirkaldy and other authorities at home and abroad. They are made by the most improved Patent Machinery and are highly approved for their uniform superior quality. All the Pipes are stamped with the Trade Mark, "**Granitic Stoneware**," as above.

TESTED PIPES.—Selected and Tested under Hydraulic Pressure and Marked

All sizes to 24in. diameter of full Standard thickness, and of any length up to 3ft. for 6in. and upwards.

PATENT PARAGON PIPES.

PATENT PARAGON PIPE. C FORM.

PERSPECTIVE VIEW

LONGITUDINAL SECTION THROUGH C.D.

SECTION THROUGH A.D.

Sound Portland Cement Joints to stand any test. True alignment of the Invert and Firm Rest. No obstructive ledges at Invert as with ordinary Socket Pipes. Free Flow. No Stoppage. Full Capacity of Sewers and Drains maintained.

CHEAPEST IN FIRST COST AND MAINTENANCE.

The **Patent Paragon Pipes** are superseding the **Ordinary Socket Pipes**. They are being specified for important Sewerage and Drainage Work in all parts for Government, Corporations and Sanitary Authorities. They have been used for the new Drainage of Smedley's Hydropathic Establishment, Matlock, Derbyshire, and the Royal Opera House, Covent Garden, London, &c.

To meet the requirements of **Sewerage** and **Drainage** according to circumstances, the **Patent Paragon Pipes** are made in **three** forms:—(A) With ordinary depth of Socket for Surface Water Drains, &c.; (B) With **deep** Sockets for **Sewers** and **House Drainage** and (C) With **extra deep** Sockets for the Best Class of Work.

When **specifying**, the Name should always be given in full, as **Patent Paragon Pipes A, B, C**, according to the kind required.

SYKES' PATENT JOINT PIPES.

THE MOST RELIABLE
PIPES FOR MAIN SEWERS
IN WATER-LOGGED
GROUND.

WATERTIGHT JOINTS
MADE WITH THESE
PIPES WHEN ENTIRELY
SUBMERGED.

The Screw Joint ensures true alignment of the Pipes. The **Patent Jointing Material** is **impervious** and **imperishable**. It sets slowly and yields for a time to any settlement of the Pipes in bad ground. It cannot enter the pipes and cause obstruction therein, as in grouting. Sykes' Patent Joint Pipes have made Watertight Joints in water-logged ground where other Patent Joints have failed. Easily laid by ordinary Pipe-layers. Bends and Junctions easily inserted.

Moderate in Cost, Easy to Lay, and the most Reliable of any for Bad Water-logged Ground.

SYKES' PATENT SEWER GAS INTERCEPTOR. The most **EFFECTIVE** for the **PRESERVATION** of **HEALTH**.
JONES & SYKES' PATENT CHANNEL BENDS FOR MANHOLES AND INSPECTION CHAMBERS.

SANKEY'S PATENT DEEP INTERCEPTING GULLY, with Galvanised Bucket to hold Detritus. Cannot untrap.

KEITH'S PATENT DRAIN TESTING AND FLUSHING TRAP. Simple in Construction, efficient and reliable.

SYPHONS, GULLIES, INTERCEPTORS, &c., with **PATENT PARAGON SOCKETS**, to avoid check to flush in forcing Solids through the Trap and fitted with **SYKES' Patent Screw Stoppers**.

INVERT, JUNCTION, and GULLY BLOCKS, STREET GULLIES to any size. **LATRINES, CLOSETS, SINKS, &c.**

Works: WOODVILLE, BURTON-ON-TRENT.

CHIEF LONDON OFFICE: 18, NEW BRIDGE STREET, E.C.

LONDON DEPOT: MIDLAND RAILWAY (Somers Town Goods Station), OSSULTON STREET, EUSTON ROAD, N.W.

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

WITH SURVEYING AND SANITARY SUPPLEMENTS

An Architectural Causerie.

International Art. If the exhibition of International Art is to be annual, then it may be regarded as certain that the New English Art Club will presently cease to exist. That it will also have the effect of reforming our English Academy is hardly to be expected, for the change, if ever it comes, must be the effect of a radical reform in its constitution, and so long as it frames its own laws this is not likely to happen. Suppose Academicians to be re-elected every three years, and all lovers of pictures entitled to vote, how precarious life would become, and how lively the papers would be! The result of infusing new blood at this rate could hardly fail to be beneficial. The Cabinet, or Selection Committee would be the elect of The Forty already chosen by us. The thousands who unblushingly send in their pictures would be reduced to as many hundreds at once, and even these would send none but their best. It may be said of bad pictures, and also of those which are only of average quality, that their room is more to be desired than their company, and it should be somebody's duty to see that every notable picture had space in abundance about it. It is simply because it has not, that so many prefer the New Gallery to Burlington House, and it is believed that this new exhibition will prove in another year to be more attractive than either. It should be remembered in this connection that it has only lately been organised, and that good as it is even now, it would have been better by far if artists in general had heard of it earlier. We would, if we could, have all the best pictures under one roof at one time and not be kept trotting round London to find them. If cliques are allowed to be formed at this rate we shall have, before long, as many show places for pictures as petty disputes among artists. To come now to the point: there are landscapes in the Knightsbridge gallery, which are perfectly splendid, and being by English painters, should by rights be at Burlington House. But the artist, like his friend on the Press, knows where he is treated best, and the Academy, for reasons more than sufficient, is not in high favour just now. If each of the paintings referred to required the space of a hundred no-account pictures, the said space should be given whatever its cost. But what, if this course were adopted, would become of the people's shillings? If the nation were made richer thereby the question might fairly be asked, but these, we believe, would be at least as readily paid if the pictures were fewer by far, and better displayed as a rule. The tendency of all forward movement is to reduce the percentage of fools in the mass, and to educate taste is to minimise the demand for what nobody really wants. As long as we live within walls there will be spaces to spare in the house for good pictures. There is a suggestion of quiet in their perfect composure, and, like coffee and muffins, they help to complete the English idea of the home; but the notion that everything painted is remarkable enough to be exhibited is worse than simply absurd. "Is such a thing as an emerald made worse than it was if it is not praised? A lyre, a little knife, a flower, a

shrub?" A feature of this exhibition, as at the Academy, is black and white work of all sorts, and the fact that the critic must go from one place to the other to obtain a fair idea of the whole appears to him to argue in favour of illustrators and engravers forming one body. The tendency to multiply mutually-exclusive societies is one of the most maddening signs of the times; but if they must be, then at least let there be a semblance of reason in the distinctions they draw. As well might a critic be asked to do an American fair in an afternoon as the Academy under present conditions, and the same in a lesser degree is as true of this exhibition. There is black and white here, black and white there, and

the same the other day—an equally heterogeneous show—at the Painter Etchers' establishment. Now, various as their productions are, there are distinctions efficiently clear between kinds of engravings and drawings to supply the basis of a classification. As every Art has its idiom, and every Art-worker the tricks of his trade to acquire, it happens that men similarly occupied are inclined to form clubs of their own. There was at one time an annual exhibition of Black and White Art, which, in the opinion of the writer, was among the principal events of the year, for, once within the walls of the building, he was able to give his whole mind to the subject. It is true that of drawings and engravings there

DETAIL OF ARRAS TAPESTRY, EXETER COLLEGE, OXFORD. "THE STAR OF BETHLEHEM."
DESIGNED BY SIR E. BURNE-JONES.

[In Illustration of our article on William Morris, and republished from the work by Aymer Vallance.]

are a great many kinds, but the critic is not a critic who is unable to see what the differences are, and to say what has been accomplished. Let it be said in conclusion that the critique cannot represent a serious effort on the part of the writer, while exhibitions (even this one at Knightsbridge) are arranged as they are. The larger the mass to be dealt with, the more cogent reasons there are for sub-dividing the subject matter. Let the Society of Illustrators combine to form one with the engravers, and let them once again every year have a show of their own. Let existing Academicians as they die out be replaced in such a way as has been suggested. Let all the best painting be shown in one place, and all the best sculpture. There is not enough of this in all London at present to fill more than one decent-sized room, but the best is unusually good. The writer, if asked what should be done with the "no-account" pictures, would have to confess that he felt rather fixed at the moment. Their name is Legion at least, and what makes them so troublesome is the fact that the humblest are so often the best. A suggestion which might find favour is that there should be no skying of pictures, and no necessity of kneeling to see them. To pictures of more than a certain size should one set of rooms be given, and to cabinet pictures the others. Then as to the non-exhibited it is thought that ignominy should not be attached to the mere idea of rejection, but that some simple system of awards, suggestive of merit, might be adopted. Then might yet another exhibition be held of paintings approved though rejected. It cannot be pretended that the artist—the prodigal son as a rule—is indifferent as to what becomes of his work, and when there is evident worth in the work we should be only too glad could we show him a way to the market.

E. R.

WE are a remarkable people.
London Year by Year.

We said as much many times, and with great emphasis last year, so that there can be no possible doubt about it. But if we are a truly wonderful nation for what we have done, we are certainly much more wonderful in what we are content to leave undone. To take London as the text of these remarks, we shall find building schemes prepared for a generation ago that are still in a notorious state of incompleteness—and likely so to remain. Nay, is not St. Paul's Cathedral an instance of a design whose completion is even now, after the lapse of more than two centuries, being tardily set about in the decoration of the interior which Sir Christopher Wren contemplated? To turn from this hoary example of how-not-to-do-it to something more recent, we have only to walk down to the Victoria Embankment to be confronted with further miracles of delay. For what purpose, think you, were the four great granite pedestals erected at the opposite ends of Blackfriars Bridge when that bridge was built some thirty years ago? Were they placed there as ornaments and for their own sweet sakes? Not so, good sirs. They were destined to carry four heroic-sized groups of sculpture, illustrative of the stirring story of the City of London. The Corporation offered the subjects for competition among sculptors, but none were found worthy, and so those pedestals are vacant to this day, as also are the others placed at intervals along the Embankment from Blackfriars to Westminster. One has, indeed, some recollection of a bronzed plaster cast of an equestrian statue of the French king, Henri Quatre, being placed on the north-west pedestal, opposite the Royal Hotel; but nothing came of it, even as nothing will probably come of the Boadicea cast just re-

moved from Westminster Bridge. Now that we have reached Westminster, we are come to a district full of such unfulfilled promises. Great George Street, Parliament Street, Delahay Street, and King Street were scheduled thirty years since for destruction and for the erection of Government buildings on their sites, but only now is a small portion of them being cleared away for the purpose. The next turning is Downing Street, and at the end of it, as you go down the steps into St. James's Park, the naked brickwork and unfinished arches of what was to have been an extension of the Home Office block, show hideously on the left hand. Then, to retrace one's steps and to proceed along Whitehall, is to come to the derelict plot of land on which, until some seven years ago, stood Carrington House, pulled down to provide a site for War Office extension. Many Committees and a Royal Commission have sat upon Government Offices sites since then, but the Carrington House site is still a wilderness—a wilderness lovely in spring and summer time with a profusion of wild flowers that by some strange chance grow there. Meanwhile, the crazy old houses in the upper part of Whitehall, purchased for the Admiralty ten years or more ago for the purpose of immediate demolition, are still used as "temporary" offices for that Department! It is safe to prophesy that when the next generation of Londoners is growing grey those temporary offices will still be in use. From these eloquent instances it may be worth while to note what has been done. Barry's great Palace of Westminster was not actually completed until Smirke's lath-and-plaster Law Courts outside Westminster Hall were demolished, twelve years or so since; and only after the vacant plot of land outside the western end of the present Royal Courts of Justice had been a scandal and an eyesore for many summers, was it turfed and put into decent order. But even that was done by private munificence, just as in 1870 that garbage-strewn iniquity, Leicester Square, was put in order and decorated by Baron Grant. Truly, we are a great people, but our rulers have their littlenesses! C. G. H.

ARCHDEACON CORNISH, in his charge to representatives of the deaneries of Powder and Carnmarth, at Truro, last week, said they had passed, and were passing, through a very critical time in the history of their cathedral. Large gifts had been given for at once continuing the building, but they were insufficient for that which ought to be done when the building was re-commenced. It was earnestly to be hoped that all would realise the extremely difficult position in which those who were responsible for continuing the work were placed. They had a plain duty to those who would follow, to use to the utmost the great opportunity presented to them in the wish of so many to perpetuate the memory of the Archbishop by carrying on the work whose completion he so ardently desired. They were almost forced to take a forward step, whatever difficulties had to be overcome, by the hopes held out to them by the London Committee. They were anxious not to place any unnecessary burden on Churchmen at the present time. They had to deal with large sums freely offered for the re-commencement of the work. They had too much in hand to stop, and yet not enough to go on. It was much to be desired that fresh gifts might be given which would enable the committee to continue the work to the west end, however much might be still left undone. They were confronted by two difficulties. They could not begin until they were within measurable distance of the sum required. Perhaps the best plan would be to appeal for £3000, to be given on condition that the building was re-commenced within a fixed time. The question of the continuing of the building must be decided in the autumn, the decision depending on the funds that might then have been promised or be in hand.

AN ARCHITECTURAL DERELICT.

KEW PALACE: PAST AND PRESENT.

VISITORS to Kew Gardens this summer will find in the Kew Palace and its adjacent grounds, which were formally opened to the public on Saturday week, a notable addition made to the attractions of that great national institution. Architecturally the building is not of great account. It is merely a pleasing specimen of the early Jacobean style, such as may be found in many parts of the district which was so favoured by the eminent and the wealthy of the Metropolis a couple of centuries ago. The palace is, however, delightfully situated in secluded grounds. It has a most interesting history associated with the private life of several of the Queen's ancestors. Built

IN THE TIME OF JAMES I.

by Sir Hugh Portman, a well-known Dutch merchant, it came into the possession of the Capel family, and by them was leased about 1730 to Frederick, Prince of Wales, son of George II. and father of George III. It was here that the Prince resided during a great part of the time of his violent disputes with his father, which are part of the political history of the middle of the last century. After Frederick's death in 1751 the Princess Dowager of Wales continued to reside at the palace and took great interest in the improvement of the gardens. She here brought up her son, the third George, in close retirement. His Majesty's consort, Queen Charlotte, died in the palace in 1818, at 75, but perhaps its most interesting association for the public of to-day is the fact that the Duke and Duchess of Kent, the parents of the Queen, were married under its roof.

A SURVEY OF THE BUILDING

reveals evident traces of the re-furnishing which it has recently undergone to adapt it to its new uses of a public show place. The painter and decorator have been busy everywhere—too busy, it seemed, for he had covered over with blue pigment some beautiful old oak panelling in the small ante-room to the left of the main entrance, which, if it had been simply cleaned and polished, would have been far more effective. In spite of the efforts of the officials of the Office of Works, an air of desolation pervades the place. There is not a scrap of furniture in most of the rooms, and there are no pictures to relieve the barrenness of the walls. The only apartments which contain anything of interest are the Queen's bedroom (where Queen Charlotte died) and the adjoining ante-room used by her Maids of Honour. These have in them several articles of furniture and various trifles which are interesting only for the insight they give into the domestic surroundings of Royalty in the early part of the century. Among the things which meet the eye, for example, are a number of specimens of needlework in frames, most of them

HIDEOUSLY UGLY

according to our way of thinking. Then there is a card-table with a cloth top, with the displayed faces of cards worked upon it in ingenious fashion. Overlooking this, upon the walls, is an engraving commemorative of Nelson's victory at Trafalgar, and hanging in close juxtaposition is a mysterious-looking astronomical chart. Several faded gilt chairs, a broken-down Chesterfield sofa, and a couple of old Japanese lacquer boxes constitute the other features of a somewhat melancholy display of relics of departed greatness. It can hardly be supposed that, with South Kensington so abundantly provided with furniture and works of Art appropriate to the period during which the building was in constant occupation by Royalty, it is intended to leave the palace in this forlorn state.

SIR JOSEPH FAYRER, Bart., has laid the foundation stone of an extension of the Fal-mouth Hotel, which will double the capacity of the original building erected in 1863 on the green slopes of Pendennis Point, to the south of the estuary of the River Fal.

RENAISSANCE WOODWORK IN ENGLAND.*

By J. HUNGERFORD POLLEN.

IN the following remarks I do not intend to touch on the matter of furniture, but to discuss woodwork, and of the Renaissance kind, from the point of view of the architect. Both in the construction of buildings and in adaptation to human occupation wood plays an important part. From the days of Greek temples, so moderate in size as compared with the imposing structures of Imperial Rome, timber has been a necessity. Special and exceptional buildings only could dispense with it; and if wood is necessary in hot climates it is much more indispensable in the north. The vast churches, halls, and palaces of civilized Europe require timber of large growth to support roofs which are of high pitch (in climates liable to heavy snowfalls), and even when the art of vaulting great widths came into use, these vaults also required a timber roof over them.

Wood in the Middle Ages and, indeed, long after, was the material of which houses and entire cities were built. London, down to the time of the Great Fire, was a timber city, interspersed with palaces, churches, of course, and castles of solid stone, but as a city with a congeries of streets, lanes, alleys, &c., it was a timber city, and once on fire it blazed as timber streets would.

Now the Renaissance was a century old when the fire took place. The art of woodwork was therefore well understood and widely practised at the time in which the Renaissance took place.

As to the word Renaissance I need hardly say, because everyone is familiar with it, that Renaissance, or new birth, means the new birth or revival of the classic learning, the works of the ancient Greek and Latin writers, and the interest in the ancient temples and sculptures of the Greeks and Romans, which these writings excited. Then, again, at the close of the fifteenth century the Roman Pontiffs had returned to Rome after long absence. There, as in Florence and other Italian States, these remains of classic art interested and captivated the Italians of the later fifteenth and the whole of the sixteenth century. It was not a new religion, but the enthusiasm it created was as great as if it had come down from heaven in the brain of some celestial messenger. Old Greek and Roman

* A Paper read before the Applied Art Section of the Society of Arts.

CHIMNEYPIECE IN PRIORY HOUSE, REIGATE.

names, Alexander, Hercules, Horace, and numerous others, were assumed or given. We hear of a Sir Julius Caesar in these sober islands. In short there was a standing out against such a mighty rush. Our particular subject, the art of woodwork, became Renaissance woodwork, and as such it remains in possession to the present day. Yes, even something of it survives in the jerry builders' roofs and partitions; much more in the roofs and stages of our great public halls and theatres.

As applied, indeed, to woodwork, the Renaissance affected the ornamentation rather than the construction of woodwork, and though it is called a new birth, it came to maturity very gradually in countries our side of the Alps.

In England the Renaissance art must be credited to Henry VII. His accession marked a new era, not in the arts alone, but in politics and manners. The feudal system came to an end at the battle of Bosworth; and the king was absolute.

As regards the new Architecture, Henry did little beyond erecting the splendid tomb made for him by Torrigiano, the Italian sculptor, now in Westminster Abbey. He built churches, though he was not fond of spending his money. But his churches were in the pointed Architecture still in fashion in his day, and we may refer to an example in his chapel at Westminster. Though it is in a debased phase, it still belongs to the English late pointed style. It is admirably constructed, and we recognise in it the work of a race of builders perfectly familiar with the system of vaulting, the weight and size of buttresses necessary to support it, and complete familiarity with their materials.

The most successful decoration of the chapel lies precisely in its woodwork, which shows no special character of Italian Renaissance, but which does show the hands of skilful constructors and carvers. The light and free fretwork of the stall canopies, and the admirable groups and figures in the round, carved under the *misereres*, may be compared with any mediæval stall carvings, showing what an excellent school of figure and ornamental detail carvers the country then possessed. As regards skill in wood construction we have proof in the adjoining roof of Westminster Hall, erected some two hundred years before. The "truss," or framed structure in ordinary roofs which throws a bridge across from wall to wall, is replaced at Westminster by a collar beam about a third of the length of the rafters, supported by a great cusped arch of timber that brings the weight of the roof half-way down the walls. Rows of small mullions with cusped arch-heads fill up the spandrels between these curved braces and the beams which they support, and complete the splendours of the construction.

Such were the structural and decorative attainments which the Renaissance woodwork was to replace. But, as we shall see, these old principles died hard.

The Renaissance Art and Architecture was introduced by the Tudor princes—gradually, no doubt. Guilds of carpenters, joiners, and carvers, under whom the workmen of the day had been educated, did not, and could not, easily unlearn a kind of art which they could put into execution by a sort of instinct. The elaborate drawings of modern Architecture were then neither provided nor required. A guild master could set his men to work, when measurements were settled. Small deviations, which do not affect the apparent correctness of measures, were overlooked or uncared for. Any examination of ranges of carved panel-

THE HALL AT HAMPTON COURT.

AN OVERMANTEL AT KENSINGTON. DESIGNED BY INIGO JONES.

ling, for instance, will show here and there such deviations. Little details in carving, such as small animals, birds, &c., are frequently found inserted to amuse the carver as he proceeded.

But these mediæval guilds survived only to the reign of Henry VIII., who seized their property.

Henry VIII. was not a builder of churches; just the contrary. He destroyed them on a large scale, and in a most barbaric fashion. But he was a builder of houses. As he was a man of considerable personal accomplishments, and well provided with money, his houses were splendid. The first and greatest of the artists he entertained was Hans Holbein, a Swiss, an accomplished draughtsman and painter, and an admirable designer, not only of portraits as the "Court Painter," but of goldsmiths' work and woodwork.

There is an elaborate drawing of a dagger-hilt and sheath by him in the British Museum, and another of a gateway from Whitehall into St. James's Park, decorated with elaborate woodwork. Where the drawing is I am uncertain; perhaps the library of Windsor Castle. Henry built for one of his queens a residence in Surrey, known as "Nonsuch," that is "unequaled." Judging from a representation in the background of a picture, it must have been mainly constructed of wood, and splendidly carved.

There is in the Priory House in Reigate a carved oak fireplace, formerly in "Nonsuch," but turned out of it after the Civil Wars, when "Nonsuch" was ruined or much injured. The fireplace has a circular seat on each side, each seat covered by a canopy of tabernacle work, the details of which—columns, triumphal arches, little figures of genii, all on a minute scale, and of a Classic character—are carved with astonishing delicacy and finish, e.g., Corinthian columns, 9in. or 10in. high (I speak from memory), are fluted, the capitals perfect in detail; each little genius, 4in. or 5in. high, correspondingly perfect; from seat to seat stretches a complicated trellis cut out of the solid, the bars of it shown in perspective, and a Tudor rose bush twining in and out. Above, two flying genii support the royal arms, sculptured to perfection.

Whether this fireplace is the work or design

of Holbein, we have no documents, as far as I know, to prove. It is his in character, and probably all the carved decoration of the place was from his drawings. Henry, like most of his royal contemporaries, liked to entertain such artists as could manage the masques, pageants and sports of their courts. Some of these required costly contrivances, shifting scenery and transformations, like those of our pantomimes. Such artists could also design dress, jewellery and furniture. Architecture they took to when required. It must be remembered that master builders of the sixteenth and seventeenth centuries were familiar with the details of mere building from long-known traditions, in this respect far in advance of professional builders of our day.

Of Holbein's architectural style there are examples at Hampton Court, and at Wilton-house, near Salisbury. As to panelling, so important an element in the finish of houses and churches, there is at Hampton Court a painting by Holbein representing the king seated with his family about him; and the chamber is panelled with elaborately drawn and gilded scroll work in each panel. Whether the painter painted from work actually existing or not we cannot say, but, seeing the splendour of such details of interior decoration as are still to be seen at Hampton Court, it is probable that he did. This is the more likely as the panelling in the picture is the back of a throne or State seat.

Henry had Girolamo da Trevigi also in his service, but no special work, as far as I know, is credited to him.

Another artist settled by his invitation in England was John of Padua, architect, but also an accomplished musician, in which capacity he seems to have served His Majesty. Very little is, at present, known of John, nor whether he hailed exactly from Padua or, as some say, from Venice. He built several of the more sumptuous country houses still existing. Longleat, in Wilts, is one. Wollaton, in Nottinghamshire, is sometimes said to be by John of Padua, but, I believe, more properly by John Thorpe.

John Thorpe belongs to the last quarter of the sixteenth century, and we know more of his work. Wollaton has been mentioned. Holland House, in Kensington, and Burghley House, near Stamford, are of his designs. A book of his studies is preserved in Sir John Soane's Museum, Lincoln's Inn Fields. Several other houses might be mentioned. He does not seem to have built timber houses nor, if we may judge from Wollaton, to have cared for decorative woodwork. The large houses built during the reign of Elizabeth have been, in many instances, only partially brought to completion internally by the original projectors. The woodwork is, therefore, often later in date and in style than the exterior,

and some of the best panelling of the time may be seen in Sizergh Castle and at Haddon Hall. Both these houses are old mediæval strongholds, with additions built at various times. In Sizergh the large drawing-room is beautifully panelled in small squares, the centre raised, and with delicate lines of moulding worked on it, in addition to the small moulded lines of rails and stiles.

Besides carving, the Elizabethan period produced a different kind of woodwork decoration, a fine example of which has been removed from Sizergh Castle to the South Kensington Museum. The entire interior of the room is of inlaid work in various patterns of arabesque ornament. The divisions of the walls, the skirting, dado, and cornice are treated with special running borders, and lengthwise the walls are divided by pilaster-shaped panels. The woods which are used for inlaying are black bog oak and white wood of some kind, probably holly. Lime or poplar are probably also to be found in this ornamentation. The ceiling, in South Kensington, is a reproduction from squeezes of the original, still *in situ* at Sizergh.

One other example of Elizabethan woodwork is from Kenilworth, the palace of Elizabeth's favourite, Robert Dudley. The ceiling of the room is of oak, divided into large squares by mouldings, and the fireplace is surmounted by an heraldic escutcheon displaying the royal arms and mantling.

The reigns both of Henry and Elizabeth saw the founding of new families, and the heads, if not men of scrupulous delicacy of moral principle, were accomplished, and built up their fortunes and their houses with much skill and corresponding magnificence.

So far, then, as to the style of woodwork properly called Elizabethan. It is, however, difficult even when the name of the architect is known, and the date of the house, to be sure as to the date of the interiors as we now see them. Usually a new style in Architecture comes in gradually, and reaches completion after a lapse of years. But the Tudors were violent rulers, and imposed their will and their fashions in house decoration, as in much more serious matters, tyrannically. Still, notwithstanding these influences, the old ideas of the nation—the memories of the splendid England of the fourteenth century—died hard, and, when the last Tudor was buried, popular taste reverted in the direction of mediævalism. The Elizabethan of the seventeenth century is that which is seen in the large majority of our halls, manors, abbeys, and houses called by these and other names, and this mixed style is more genuinely English, and continues more popular, than the classic style of Jones and Wren, which belongs to the time of the later Stuart kings, and is of a confirmed academic character.

(To be continued.)

STALLS IN HENRY VII. CHAPEL, WESTMINSTER ABBEY.

WILLIAM MORRIS:

HIS ART, HIS WRITINGS, AND HIS
LIFE: A RECORD.*

BY AYMER VALLANCE.

THE selection of a writer to undertake the biography of a great man must always be a matter of difficulty. If a disciple be chosen, with the idea that thus a sympathetic interpretation may be placed upon the acts and facts of the life, and so present to the public a truer picture of the man, there is always the danger of a nauseating degree of praise, for the devotee scarcely dares to differ from a single act of his idol; while in any other case there is a possibility of such lack of sympathy, in one place or another, as to seriously lessen the chance of a full setting forth of the character and aims of the subject. The life of William Morris, by Aymer Vallance, is plainly the work of a devotee, though it gives one rather a shock to find a Latin dedication of a pronounced Roman Catholic type at the commencement, which shows that on one point at least author and subject were not in harmony. Whatever the opinions of William Morris may have been in early life, the ideal which he set himself to exhibit in his later days with so much charm (as in "News from Nowhere"), is fairly described in the quoted words of Mr. Frederic Myers: "Religion and philosophy disappear altogether; science and poetry are in the background; but we are left with the decorative arts, open-air exercise, and an abundance of beautiful and innocent girls."

Although in his preface Mr. Aymer Vallance disclaims any intention of writing a biography in the ordinary sense, his book necessarily is arranged very much on chronological lines, and for nearly half of its substance deals with matters in strict sequence. After a very short sketch of Morris's life until he left Oxford, where his life-long friendship with Sir E. Burne-Jones commenced, Chapter II. introduces us to the pre-Raphaelite brotherhood and its principles and aims, which appealed to him very keenly, though he never became actually a brother; and commences the subject of the early literary work, which is continued in Chapter III. Here the extensive quotation from the opinions of other people (mostly favourable, of course), which is so observable throughout the book, commences. These quotations occupy so much space as to suggest that the author felt it necessary to support his own opinions by those of people of more weight in the literary and artistic world. Out of the fourteen pages of which this chapter consists, more than six are quotations from reviews.

Chapter IV. gives an interesting account of the Red House, built by Mr. Philip Webb for Morris, near Bexley Heath, where he lived for about six years, till the increasing business of Morris and Co. necessitated his living in London; and Kelmscott Manor is similarly described in Chapter VII. The next chapter is devoted to a pretty full history of the establishment and proceedings of the firm, and is perhaps the most interesting in the book, being evidently written from data supplied by Morris himself, and by those who worked with him at one time or another, and copiously illustrated. The various crafts taken up one after the other are mentioned in their order, and many of the more important pieces of decorative work are described, the names of designers being given, with details as to the mode in which, in later days, the various parts of the designing were distributed. With such powerful designers as Madox Brown, Rossetti, and Sir E. Burne-Jones, besides Morris himself, whose feeling for colour was so fine, it is small cause for wonder that their stained glass attained so rapidly such a well deserved reputation. Tiles, wall papers, textiles of various kinds, dyeing, simple furniture—all these were taken up one by one with great success. On pages 84 and 85 is a long and valuable quotation from Morris's lecture on "The Lesser

ANGELS IN ADORATION. FROM A CARTOON BY WILLIAM MORRIS.

[Republished from Vallance's *Life of Morris*.]

Arts of Life," which refers to the designing of wall-paper, and says pretty nearly all that can be said upon the subject, though it may be thought to be a little over-exclusive when defining the sources from which patterns may be derived. Nature is, no doubt, the great reservoir at which each designer fills his little pitcher; but the convention adopted by a designer of long ago is often as stimulating to the imagination as anything brought direct from the fields, and this Morris's own practice frequently showed. See, for instance, the "Bruges" wall-paper, facing page 92, and the tapestry in silk and wool, facing page 96, both so fine and both so evidently suggested in arrangement or detail by ancient examples.

The mode adopted in the making of carpets and tapestries is fully described, and the extent to which various hands and minds have assisted in the production of the latter especially. It is wonderful that there should be so much unity in these, considering that several designers have generally assisted, and this fact rather goes to disprove the contention of some of the most modern architects, viz., that it is necessary for buildings to be designed by the same brain throughout, so that there may be unity of effect, not only in their structure, but in their ornament and furniture, and even in their external surroundings. The work of the firm failed a little sometimes in proportion. The borders of carpets, for instance, were frequently scarcely broad enough, the curly acanthus scroll, which Morris was so fond of, was frequently over large, engrossing the attention too much, and in the more decorated furniture the proportion of inlay to ground was sometimes defective—blemishes which Morris's own work has so much assisted us to perceive.

Chapter X. contains an account of his lectures, articles, and opinions, from among which a few of the last may be extracted as showing his attitude towards the arts of picture painting and design in general. "The aims of a painter should be: 1st, expression of imagination; 2nd, decorative beauty; 3rd, realisation of Nature; 4th, skill of execution. Success in any of the three first of these aims, together with the last, will give a picture existence as a work of Art." The aims of the P.R.B. were slightly different from these, as Morris described them in a lecture quoted on p. 14. Their root doctrine was Naturalism, the second requirement was an epical quality, and in the third place was put the ornamental quality. There is no doubt that he was right when he said, in continuation, "No picture is complete unless it is something more than the representation of Nature and the teller of a tale. It ought also to have a definite, harmonious, conscious beauty." And

one other distinguishing feature was needed, viz., Romance, which distinguished Burne-Jones's work supremely among those whose aims were of this kind. His opinion as to the eclectic art of to-day seems to have wavered back and forth. On page 243 he is quoted as saying: "If a man nowadays wants to do anything beautiful, he must just choose the epoch which suits him, and identify himself with that—he must be a thirteenth century man, for instance. . . . Whatever there is of the art of our own day that is worth considering is eclectic." While on p. 266 his opinion is stated to have been that it was utterly impossible for an organic and living style to be derived from an eclectic one.

When speaking of design before the Royal Commission of 1882, he expressed an opinion that "the French are above all things masters of style in the arts of design. . . . they can take two or three ugly things and combine them into a congruous whole, which looks plausible at least." At the same time, he said: "I think that in appreciation of beauty, in love for beautiful lines and colours, the French cannot be said to be superior to the English." It is curious that English designs should be much in demand in various parts of the Continent, while the English market still consumes vast quantities of those produced in France, notwithstanding the great influence which the teaching and example of Morris and others have had. He was also strong upon the necessity of the designer having technical knowledge of the manufacture for which he was designing. This seems an obvious necessity; but there are still designers, and teachers of design even, in England, who know very little of the technical processes used in the production of their designs, and who, therefore, frequently desire effects which are only to be gained with great difficulty, and are not in the end as beautiful as those to which the material lends itself. He held strong opinions, too, on the subject of Japanese art, maintaining that as Japan is subject to earthquakes, and, therefore, could never have large and imposing stone structures, but must content herself with edifices of wood; and as all earnest art is founded in Architecture; it was impossible that there should be any art of real account in that island. The fact of the buildings being mostly of timber should surely have been insufficient to prove this to Morris's mind, for Norse buildings also were mainly of timber, and Norse decorative work must have been highly esteemed by him, as his design was influenced by it; and it is curious that he should have so little appreciated Japanese drawing and painting, since the graphic qualities shown in it are just those qualities which

* William Morris: *His Art, His Writings, and His Public Life: A Record*. By Aymer Vallance. London: George Bell and Sons.

two pages later are declared to be specially characteristic of his own literary work: "His touch has the quality of being swift, and firm, and unflinching." This would describe accurately some of the great Japanese painters. And on page 409 is another sentence descriptive of Morris's design for book ornaments which is equally appropriate: "The decorative instinct in him was so supreme that whatever occurred most spontaneously to the artist's hand to design at the moment, that he did."

Notwithstanding his great achievements in the way of decoration, to many his literary work shows him at his highest. The power which enabled him to write "The Lovers of Gudrun," a poem of 750 lines, at a single sitting of twelve hours, is a power possessed by few, if any, literary men, and is another example of that Japanese dexterity, compounded of concentration and thorough knowledge of the subject, already referred to. Mr. Vallance treats the question of the poems and romances at great length, and sympathetically. Many of us remember how the appearance of "Jason" delighted us, and how the "Earthly Paradise" was read over and over again, the spell never failing by which the enchanted land opened before our eyes, through which we might wander for a time in the delightful company of the "idle singer of an empty day." The later books were none of them quite so charming, perhaps partly because no success can be repeated, but partly also, perhaps, on account of a certain artificiality not sympathetic to the great body of Englishmen, but which, in the opinion of some critics, was more in harmony with the author's latent energies than the earlier poems. The Romances followed, an endeavour to realise the conditions of primitive Northern life, and with their vigorous and picturesque prose delighted a certain section of the cultivated public; but it may be doubted whether they ever had anything like the influence which the poems of his middle period exerted.

There is a long chapter on the Socialist propaganda, which describes how rapidly that movement, which was intended to bind the workers of all nations into one harmonious whole, split up into many sects, which spent much of their energy in denouncing each other.

At this time he decided to set up a printing press for the production of handsome editions of desirable books, the first issued being his own story of "The Glittering Plain," published in 1891. For these books he designed all the ornaments as well as the founts of type, each letter being drawn large so as to make sure of its line and proportion, and then photographed the required size before being sent to the type-cutter. These books are of varying degrees of merit, but as a whole form by themselves a monument to which any man might trust his memory. He was very particular about the quality of his paper, requiring it to be made of rags only, for he foretold that the machine papers, largely made of wood pulp and clay, would perish; a result which actually occurred in a library in Brazil not long ago, where the only books remaining out of a large collection were the volumes of an old edition of Hume's "History of England," the damp and warm climate having converted the others into pulpy masses, owing to the bad materials of which the paper had been made.

William Morris was certainly one of those men who leave a broad and deep mark upon the time in which they live. He was very original, determined, and masterful, yet with the power of attaching men to him which is one of the qualities of the leaders of men, and had also the defects of his qualities, which were well known to those who had much intercourse with him, but need not be specified here. He was before all things, spite of the practicality which was shown by the success of his commercial undertakings, a dreamer of dreams and a seer of visions—many of which he had the good fortune to be able to realise, thanks to his possession of capital. A book which deals at such length with so interesting a character cannot fail to be interesting itself, though in this case a little prolix. Two appendices give a chronological list of Morris's published writings, and of the productions of the Kelmscott Press.

AN OLD DEVONSHIRE CROSS.

RESTORATION AT BUCKLAND MONACHORUM.

THE old-world village of Buckland Monachorum celebrated the restoration of the village cross a few days ago. The village is charmingly situated on the fringe of Dartmoor. Buckland Abbey was founded by St. Bernard of Clairvaux, at the instance of Amicia, Countess of Devon, in the thirteenth century, and it would appear that at one time a market was held in the village. There was every evidence that the old stone cross in the village had been removed from its original foundation, and signs were not wanting that a market-square had existed. Judging by the stones remaining the cross must have been of an imposing character. The remains of the old cross were found to be in a very imperfect condition. Considerable portions of the four basement steps and a very large and massive plinth stone were found, but nothing more, although a careful exploration of the district

THE RED HOUSE. EARLY MORRIS GLASS.

[Republished from Vallance's Life of Morris.]

brought to light many ancient worked stones. Having consequently very little to guide them to a true restoration, the matter was placed in the hands of Mr. E. Sedding, of Plymouth, who had made a special study of such subjects. He had no doubt that the remains were part of

A LANTERN OR GABLED CROSS

with figures, as all such large crosses of the sixteenth century invariably were, and on that idea it was restored. That it might entirely harmonise with and illustrate the parochial history, the figures of St. Andrew the Apostle, and St. Bernard, the founder of the Order of Monks at Buckland Abbey, have been placed in two of the niches, and in the other two are shields, one with the arms of the diocese and of the Bishop of Exeter, and the other armorial bearings of the Abbey—a lion rampant—given it by Amicia, Countess of Devon, in the year 1278. The work of restoration was done by Mr. Philip Bloye, a native of the village.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
June 1st, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

WE are pleased to learn that the pretty design for a house, by Mr. Francis W. Bedford, which we illustrated last week, exists in bricks and mortar. The house is known as Weetwood Croft, and is situated near Leeds.

MR. HOGARTH, the new director of the British School at Athens, has been continuing the excavations in the island of Milo with success. The ruins of an Acropolis of a remote period have been laid bare, together with the remains of three cities, superposed one on the other, two of them have proved rich in fragments dating from the Mycenaean epoch. Professor Gardner, a former director of the school, has gone to Milo, accompanied by a score of students of University College, London. It will be remembered that Milo furnished the finest piece of antique statuary extant, the famous Venus of the Louvre.

MONEY would be well spent by Truro Town Council in improving the river immediately below the town quay. At present the outlook is far from pleasant to the large number of excursionists on the beautiful River Fal, while the narrowness of the approaches to the quay give difficulties, not always free from anxiety, to those in charge of vessels. It is proposed by the River Committee to spend close upon £2000, and there appear to be other improvements in view. Judging from the discussion at a recent meeting of the Council there is every probability of the outlay being sanctioned if a desirable right-of-way can be obtained, and it is hoped that the landowner and others interested will give the Council every reasonable facility in this matter.

THE French Gallery of Pall Mall has this spring a very pleasant and reposeful exhibition, in which the Barbizon schools, the modern Dutch landscapists so fashionable just now, and the English schools of present and past times play an equal part. The examples of the Barbizon masters, if not of imposing dimensions or commanding excellence, are for the most part interesting. Very curious is the sketch in oils by Jean-François Millet, "The Good Samaritan;" there are two or three Corots of the usual blond, delicate beauty, and two landscapes by Daubigny of an intimate pathos and charm. Of a Constable-like breadth and virility of treatment is the important study by Théodore Rousseau. M. L'Hermitte's landscape, "Harvest Time," serves but to prove once more that this excellent artist is a draughtsman rather than a painter—that black-and-white and not colour is his true field. In M. Gérôme's best manner, "The little Oriental piece," "In the Mosque," which was quite recently seen at Christie's. The pièce de résistance in the British section of

the exhibition is J. W. Oakes's large transcription of English scenery, "The Fallow Field." So true is this picture in its suggestion of moisture-laden atmosphere, so sincere and naïve in its expression of a scene too simple to attract landscape painters of the present generation, that it may fairly take rank with the better French Art of the generation to which it belongs. Among the famous Dutchmen represented are Josef Israels, Mesdag, Jacob Maris, Ter Meulen, Neuhuys, and Anton Mauve. The latter is seen to great advantage in a characteristically sad scene, "After Work." In the decline of a grey afternoon, scarcely cheered by a few scant rays of pale sunlight, the husbandman and his weary horses are seen receding from the foreground straight towards the distant horizon. Vastness, solitude, and uncomplaining submission to the melancholy of the sad, leaden hours are all conveyed here without any departure from artistic conciseness or the modesty of the simplest and most pathetic truth.

THE fourteenth annual exhibition of the Home Arts and Industries Association has recently been held at the Albert Hall. The subject most widely taken up appeared to be wood-carving, and many of the specimens on view not only displayed a high degree of technical skill, but are also of considerable size and importance. Leather work is very popular. Homespun fabrics of various sorts form another department that is well represented, one of the most interesting stalls being that which contains samples of the work done by cottagers in the neighbourhood of Windermere. The attempt to revive the lace-making industry seems to be meeting with fair success, and a considerable amount of home-made lace is on view. Other industries which the association fosters are represented by exhibits of basket-making, pottery, metal work of various sorts, needlework, embroidery, &c.

LONDONERS have for many boating seasons past noticed the boards by the riverside near Twickenham announcing that the Peel Estate at Marble Hill was to be let or sold, and have wondered what would be the end of the fine house and of the beautifully wooded ground fronting the Thames here. For some eight or nine years the place has failed to find an occupant or a purchaser, and it has latterly seemed likely that it would be eventually sold for building purposes—a prospect viewed with dismay by all who would keep the sylvan beauties of the Thames above London unspoiled. It now seems likely that the estate will be purchased by the Twickenham District Council for a public park, thus preserving the rural beauties of the foreshore. The estate occupies sixty-three acres, with a house in its midst. Part of the cost of purchase may be recovered by selling portions of the land away from the river for villas.

Nor for the first time, by any means, one of the galleries of the Fine Art Society, in New Bond Street, is filled with choice and treasured specimens of seventeenth and eighteenth century Art, comprising some of the most perfect examples in the world of miniature painting, side by side with those drawings in pencil and crayon completed with touches of colour, which were so characteristic of the period when everybody who was anybody, and many others who were nobodies, were as a matter of course painted or drawn "in little." Added to these is an assortment of those engravings that are now so much sought after by collectors.

FURTHER information has reached me, says a writer in the City Press, concerning the proposed purchase of a part of the site of Christ's Hospital by the authorities of St. Bartholomew's. There is no intention, it appears, of securing the Newgate Street frontage with a view to improving the position of the hospital from an architectural standpoint. The scheme is, indeed, confined to a proposal to acquire part of the site facing Little Britain, so that the hospital buildings may be rendered uniform in appearance, and that the accommodation

provided may be extended in the way the necessities of the case demand.

An interesting find is reported to have been made at Treffgarne, near Haverfordwest, in the course of excavations for building purposes. When engaged digging out for the foundations of a house, the workmen came across an ancient stone for grinding corn by hand. The stone is very like those even now used in India, especially as a form of hard labour punishment. An antiquarian suggests as a reason why the stone was hidden in the ground that the place was probably the site of a house where the grinding of corn was carried on surreptitiously and without the knowledge of the lord of the manor, who may have held the concession of the right to have all the corn grown in the manor ground at his mills. This is not the first stone of the kind found in the neighbourhood.

A CORRESPONDENT states that there has just been opened out near the village of Gwaenysgor, which lies between Prestatyn and Rhyl, a most interesting "bone cave." It is situated on the farm known as "Gop," the property of Mr. M'Laren, M.P. Some years ago the mountain was explored under the direction of Professor Boyd Dawkins, Manchester, and a cave was discovered in which were found skeletons and implements of the polished-stone period. The cave just opened out had been known to exist for some time; or, rather, its existence had been suspected, its masked mouth, filled with débris, having been located. Recently operations were commenced and the débris removed, and the cave has been sufficiently cleared to prove that it is a good specimen of the bone caves found in Wales.

Now that Parliament, by its rejection of the Westminster improvement scheme, has definitely decided that private speculators must take no part in the improvement of London, it is to be hoped that the London County Council will realise the responsibility that rests upon it. That the ratepayers at large, and not merely a few capitalists, should benefit financially by a great public improvement is theoretically a truism, but, at the same time, it is a distinct injustice to the speculators as well as to the community that, when the Council declines to move, Parliament should intervene and prevent a private body from benefiting themselves as well as others. We have waited long enough for the Council; but so far there appears to be very little possibility of their taking action. Now, however, that Parliament has shown its hand, perhaps the Council will take the hint, and give expression to the wishes of the ratepayers generally by proceeding in earnest with the several improvement schemes that have been hanging fire owing to the Utopian theories of certain ultra-Radical members.

THERE has just been opened at the Dowdeswell Galleries a series of water-colour drawings by Mr. Hampson Jones, wherein he embodies his impressions of a trip to Ceylon and Burmah. This artist is a believer, when water-colour is used, of swift records of vivid impressions, and he is particularly happy in the presentment of native figures in their bright-coloured attires issuing from Buddhist temples, or grouped about the many shrines that surround the famous Shwe Dagon Pagoda at Rangoon; or, again, of the pilgrims that fare every fourth year to the Dalada Maligawa at Kandy, there to witness the exposition of truth. The drawings are freely executed, there is no over-emphasis of detail, and the collection as a whole is distinctly pleasant.

MR. D. W. STEVENSON, R.S.A., has just modelled in the clay the colossal statue of Burns for Leith. The figure, 9ft. in height, is alert and suggestive of youthful life. Burns stands firmly on the right foot, with the left slightly advanced. He wears the coat of the period, with open throat and ample collar and lapels; and his attire further consists of long waistcoat, kneebreeches, ribbed hose, and shoes. A plaid, thrown over the left shoulder, has been effectively arranged both for front

and back drapery, the back view having been equally carefully considered. The right arm is carried across the breast, and grasps the edge of the plaid; while the left, hanging down by the side, holds his hat. The figure will stand on a pedestal 10ft. high.

CONSIDERABLE local interest has been aroused by an alleged desecration in the churchyard of Kilmaveonaig, near Blair-Atholl, Perthshire. The church, which is a small edifice, is centuries old, and, it may be mentioned, contains in its belfry the famous bell of "Little Dunkel." While carrying out extensive alterations and renovations in the church, the contractor came upon a number of skeletons. The larger part were collected and reinterred, but the remaining excavations, which contained many fragments of bones, were left outside the church. It was alleged that the remains discovered were those of the Robertson family of Lude, and the matter being brought under the notice of Mrs. Robertson Matheson, secretary of the Clan Donnachaigh Society, that lady paid a personal visit to the churchyard lately, and at the same time spoke to a number of the residents on the subject. A special meeting of a local sub-committee was held at the churchyard. An exhaustive statement was read from Mrs. Robertson Matheson, and the committee entertained no doubt whatever that a large quantity of the soil, containing fragments of human bones, was excavated partly from the burying vault of the Robertsons, lairds of Lude, and partly from the floor of the church generally. The committee resolved to build a retaining wall at the foot of a slope at the back of the church, thereby forming a pit in which all the excavated soil will be placed.

THE latest contribution to the smoke abatement controversy that we have seen is a pamphlet by Mr. W. Nicholson, Smoke Inspector, Sheffield, published by the Sanitary Publishing Company, and entitled "Practical Smoke Prevention." Is there no remedy for the emission of thick, black smoke from boilers and furnaces? Mr. Nicholson answers, as the Smoke Abatement League have answered, that there is. In the bulk he has very little that is favourable to say of patent appliances placed upon the market as infallible methods of removing the nuisance. They have, he contends, invariably failed to realise the expectations formed of them, and to end or minimise the trouble. At the same time, he is strong in his desire to correct the impression which he has found to largely prevail that manufacturers have done nothing in recent years with a view to prevent the pollution of the atmosphere. Hundreds and thousands of pounds have, he says, been spent by some manufacturers through the serving of a simple notice to abate, but still there is the smoke.

In treating of the means by which practical smoke prevention can be secured, Mr. Nicholson has much to say on common-sense conditions of working, firemen's skill and training, and the admission of air into boiler and furnace; but his main factor in the bringing about of a better state of things is the man at the wheel, so to speak. He says as much as this in his introductory pages. "My aim," he remarks, "is to address, in a few short, simple sentences, all persons who are interested in this question, but more especially do I speak as an engineer to engineers, engine-tenters, boiler firemen, and furnace-firemen. To these I would say that smoke prevention is entirely in their hands, in spite of any appliances, automatic or otherwise." A statement such as this surely weighs in favour of an energetic application of the provisions of the Public Health Act in the case of persons guilty of the particular offence under notice. There is the less excuse for the toleration of ignorant or lazy stoking, inasmuch as Mr. Nicholson himself leads the reader to infer that in other respects manufacturers have shown willingness, often at great expense, to comply with the statute.

MESSRS. CHRISTIE, MANSON, AND WOODS concluded on Monday week the sale of the ancient

and modern pictures and water-colour drawings of the late Mr. Joseph Rushton, of Monk's Manor, Lincoln, the day's sale realising £2998 10s., showing a total of £44,995 13s. 6d. for the entire collection of 237 lots. The few noteworthy drawings in the last portion were:—E. Ellis, a moor scene, with figures and sheep—37 guineas; two by T. B. Hardy, the Doge's Palace, 1879—46 guineas, and San Giorgio, 1879—52 guineas. The pictures included:—J. Collier, "The Child Bride," 1883—95 guineas; H. Dawson, a timber yard on the bank of a river, with barges—100 guineas; G. E. Hicks, "Cinderella," 1878—62 guineas; W. Logsdail, a view in Italy, with bullock wagon and figures on a road, 1891—56 guineas; J. B. Pyne, "Thames Recollections"—76 guineas; G. Koller, Philippine Wesler, clandestinely married to the Archduke of the Tyrol, imploring pardon with her two children at the feet of the Emperor Ferdinand I. at Prague, 1551—110 guineas; and a work after Bonifazio Veronese, by Teniers, the Virgin Mary and two saints seated in a garden, on panel, 16in. by 17in.—220 guineas.

In their official report, the Executive Council of the Amalgamated Society of Joiners and Carpenters, which has 738 branches and 53,000 members in various parts of the world, describes its business in Capetown, Cape Colony, as fair, in the Johannesburg first branch as dead, in the Johannesburg second branch as very bad, in Kimberley (Cape Colony) as overstocked, in Pietermaritzburg (Natal) as declining, in Port Elizabeth (Cape Colony) as moderate, and at Pretoria (Transvaal) as dull. The Amalgamated Society has nearly 600 members in South Africa.

The Daily Mail describes a "dainty model flat at 7, Sloane Street":—"The dining-room, with its walls of deep rose-red, thrown up by the black-framed pictures, with touches of yellow in the soft silken hangings, suggests at once that atmosphere of comfort and ease and enjoyable stimulation. The French drawing-room, all green and gold and rose-hued, with its pretty French furniture in gilt and brocade, forms a charming background for pretty face and pretty frocks. Who could not work, too, in the Jacobean study, with panelled walls and medallioned windows, and little blue-tiled Dutch fireplace, and reposeful tones of lapis lazuli blue? The bedroom is arranged in softest blue and white, with Sheraton furniture. Even the tiny hall of a London flat is converted by magical arrangement into a cosy boudoir, gemlike in colour, with its turquoise blue walls, soft white flowers, and dark relief of brown in furniture and floor."

Drs. REICHEL and WILHELM, secretaries of the Austrian Archaeological Institute, have, a Vienna correspondent says, made some interesting discoveries in Northern Arcadia in the famous sanctuary of Artemis in Lusoi. The site of the temple is 4500ft. above the level of the sea in a beautiful mountain country with Mount Chelmos on the right and the wonders of the Styx waterfalls below. The Austrian men of science have laid bare the terrace of the sacred place, a semi-circular building, and a simple propylaeum. Both buildings had stone foundations, the walls being of clay bricks. The place must have been destroyed by fire. Besides fragments of the building, votive objects were found in great numbers, especially terra-cotta figures, small bronzes remarkable for their splendid patina, and on the doorposts was a series of Grecian bronze inscriptions of the fourth and third centuries before Christ. These promise to be of great interest.

An interesting antiquarian discovery has been made in the small church of Radanito, in the Bucovine. It consists of a rich tapestry embroidered in gold representing the Death of Christ. It is in a wonderful state of preservation, and the inscription is perfectly legible. It states that "this tapestry was the gift of Alexander the Good, Prince of Moldavia, who, in 1409, built this church at his own expense."

SOME four hundred black and white drawings and sketches are now on view at Cutlers' Hall, Warwick Lane, Newgate Street. The collection forms Messrs. Cassell and Co.'s sixteenth annual Exhibition, and the pictures shown are the originals from which the illustrations in the firm's various publications have been or will be produced. Many black and white artists of eminence are represented, and styles and subjects are pleasingly varied. Mr. W. S. Stacey has a fine series, entitled "Women of the Bible." Mr. H. Railton, in "Ightham Mote," Kent, has found a congenial subject for a number of exquisite interior and exterior views in the perfection of pencil work. Mr. Holland Tringham has some fine architectural sketches, whilst Mr. J. Pennell shows two very choice specimens of pen-and-ink drawings, the subjects being the interiors of "The Charterhouse Chapel" and "The Hall, Charterhouse." Both possess a characteristic boldness and, at the same time, ample detail. The late Mr. Fred Barnard is represented by a large number of amusing character studies. Mr. H. E. Tidmarsh has two City views, both excellent—one, entitled "London Bridge," showing the crowded state of the river about the famous structure; and the other, entitled "View from the Monument," showing the river winding seaward below the Tower Bridge. A number of Mr. Wal Paget's illustrations to "Robinson Crusoe" are hung, while a very choice little picture represents "Cromwell on His Way to London." The Protector and a straggling party of horsemen are leisurely crossing the open country. In the foreground Cromwell's spaniels are just bursting through the sedge and rushes that fringe a wayside pool, startling up the wildfowl and compelling the attention of the riders. The charm of the picture lies in the fact that Cromwell and his satellites are caught at a moment when the inevitable "ironside" temperament has been abandoned. All ages, climes, and seasons have been laid under contribution by the artists, and, whilst it is impossible to mention more than a few, it is equally impossible to avoid being struck by the strength and cleverness of the majority of the exhibits. Some of the landscapes—at home and abroad—are delightful, whilst the many military scenes are stirringly portrayed.

In the Queen's Bench Division last week Mr. Justice Grantham and a special jury heard the case of Marcy v. Beckett, an action by Madame Blanche Marcy, a dealer in works of art, in business in Bedford Square, against Mr. Ernest W. Beckett, M.P., to recover £1090, the balance of an account for certain pictures alleged to have been purchased by the defendant of the plaintiff. The defendant said the purchase was conditional. Mr. Marshall Hall, for the plaintiff, said the plaintiff had dealt with the Rothschild family for many years, and was introduced to the defendant by Baron Ferdinand de Rothschild, who was well acquainted with the value of works of art. In 1896 the defendant went to the plaintiff's place of business, and purchased an antique sofa of the Louis XVI. period for £140. The sofa was sent to the defendant's London residence, but it was not paid for at the time. On April 7th, 1897, the defendant again visited the plaintiff's place of business and saw four pastels, signed François Boucher, representing Music, Dance, Song, and Painting. François Boucher was a well-known artist, who was born in 1703, and died in 1770. Eventually the defendant agreed to purchase the pastels for £1450. The defendant also purchased a picture by François Mieris, the subject being a lady eating oysters; and a portrait of Philippe le Beau, the beautiful father of Charles V. After the defendant had made the purchase he gave the plaintiff a cheque for £500 on account. The following day the plaintiff sent in her account, giving credit for the cheque, and subsequently the defendant wrote to her to the effect that he was only to take the pastels on his being satisfied by an expert that they were genuine. The plaintiff's case was that though she believed the pastels to be genuine, she gave no warranty. The defendant asked the plaintiff to take the pastels to M. Mannheim, art expert, and he referred her to

M. Feral, an expert in Paris, who examined the pastels, and said they were very beautiful pictures of the time of Boucher, though he could not certify that they were painted by Boucher. When M. Feral was examined on commission for the purposes of the present action, he said that the pastels were not genuine. Mr. Marshall Hall submitted that there was no warranty. It was held that a warranty had been given and that the pastels were worth £200.

HEXHAM ABBEY is a place of historic importance. Within the past few days there has been observed a serious shrinkage at the furthest pillar of the northern transepts. There are ominous looking cracks in the arch above, and to avert serious damage to that part of the noble structure a large outlay of money will be needed. Probably the erection of a buttress or arch against the north wall may be required. The matter is likely to receive immediate attention. At one time interments took place in the transepts, and it is surmised that a former sexton had dug too near this particular arch, and so caused the shrinkage.

AN interesting discovery of caves has just been made about four miles from Maidstone and one and a half miles from Hollingbourne. A short while ago some boys found an entrance to the caves, and on the matter being reported the locality was explored. It was found that the caves were so extensive and remarkable that it was decided to make a show place of the caverns. Lamps have accordingly been fixed throughout the whole of the caves, which extend for miles, and a cord is run throughout, so that visitors may not lose their way. The origin of the caves can only be conjectured.

THE members of the legal profession in Leeds will shortly favour the local authorities with their views on the new Building Bye-Laws of the Corporation. As a matter of fact, the Leeds Incorporated Law Society have been engaged for two or three months past considering the subject, which they regard as one of great importance. The bye-laws were submitted to them by the Town Clerk, who inquired if they had any remarks to make, and in due course, we understand, a detailed report will be prepared and handed in. The various questions, we are informed, have been gone into very carefully, and it has been decided to draw the attention of the authorities to a number of points in which, it seems to the Society, some amendment is required.

THERE will be considerable excitement among the leading sculptors as to who will have the opportunity of attaining distinction through the commission of the statue of Mr. Gladstone. Mr. Gilbert has probably put himself out of court by his recent failure with regard to the Bright statue, and presumably it will rest between Mr. Onslow Ford, Mr. Thornycroft, Mr. Bates, Mr. Frampton, and Mr. Brock. None of these should have much difficulty in producing a work which will put all its surroundings in the north transept of the Abbey into the shade.

It is expected that within the next month or two the new electric railway connecting Waterloo with the City will be in full working order. The railway is constructed in the same way as the City and South London line, consisting of two huge iron tubes, one for up and the other for down traffic. These tubes are now actually laid between Waterloo and the company's City station, which lies under Queen Victoria Street in the vicinity of Bucklersbury, but the electrical apparatus is not quite ready, and further, the exits from the City station have yet to be completed. The exits are being made by the Central London Railway Company, and the two first to be opened will be at Mappin and Webb's corner and the corner of Walbrook respectively. A subway will connect the Central London and the Waterloo and City lines, and when the first named is in working order passengers by either railway will have the choice of some half-dozen exits in the neighbourhood of the Bank.

THE ARCHITECTURAL ASSOCIATION DINNER.

PROFESSIONAL TOPICS UNDER DISCUSSION.

THE Architectural Association has reached the close of another session. The *finale* came last week. The work of the winter is at an end when the annual dinner comes round, and this signal event happened on Thursday at the Holborn Restaurant. Matters were on a lesser scale than was the case a year ago, when, it will be remembered, the Association celebrated its jubilee. This year, differing from last in this respect, the guests were all directly or indirectly connected with the Profession. Mr. Hampden W. Pratt, the President, was in the chair, the company including Dr. Garnett and Messrs. H. T. Hare, W. D. Caröe, F. W. Pomeroy, Beresford Pite, A. R. G. Fenning, C. H. Bedells, W. H. Jamieson, Professor F. E. Hulme, H. B. Ransom, W. A. Pite, E. O. Sachs, E. A. Runtz, G. McLean Ford, G. M. Nicholson, W. Eckstein, G. Sherrin, G. H. Fellowe-Pryne, E. Fellowe-Pryne, H. Fellowe-Pryne, A. W. Johnston, C. H. Smith, H. Lovegrove, H. B. Creswell, F. W. Macey, F. H. A. Hardcastle, H. Tanner, H. Tanner, jun., F. J. O. Smith, J. O. Smith, B. F. Fletcher, A. H. Tiltman, R. Savage, A. Conder, A. T. Walmisley, T. C. Cunningham, S. B. Beale, F. G. F. Hooper, F. R. Taylor, E. L. Harrison, J. Neale, W. J. Locke, R. Direks, E. H. Sim, D. G. Driver, A. O. Collard, F. Sills, H. J. Leaning, C. D. Imhof, A. S. Flower, F. R. Farrow, P. A. G. Wood, A. C. Breden, F. T. W. Goldsmith, H. A. Satchell, Clarke Edwards, H. J. Moodie, W. G. B. Lewis, A. W. Weedon, P. Buckman, A. Wood, G. A. Cracklow, C. Brée, J. H. Wilson, F. D. Clapham, G. B. Carvill, Leonard Butler, W. H. May, S. Constanduros, J. E. Franck, T. W. Aldwinckle, jun., J. G. N. Clift, and W. E. Davis.—The president opened the toast list with "The Queen." He referred to the Association's dual celebration of Her Majesty's Diamond Jubilee and their own jubilee a year ago. The toast having been honoured, Mr. Pratt proposed "The Royal Institute of British Architects." For many years past, he said, the Association had not had a dinner without having ranked this toast in the forefront of its list. He proposed in a few words to put before them

THE INSTITUTE IN ONE OR TWO OF ITS ASPECTS.

Firstly, he would take the Institute as it was regarded from outside its ranks. In high official circles it was looked upon as being at the head of the profession. This was no doubt the right position of the Institute. So far as the public was concerned, it was doubtful whether the Institute—or, for that matter, the whole body of architects throughout the country—was recognised as it ought to be. Of course, there were many able members of the Profession who were not in its ranks, and, personally, he held this to be a calamity, not for the Institute, but for the Profession. So long as this was the case architects would not be able to speak with that united voice which they ought to command. He would like—and in this he was supported by the feelings and thoughts of a good many, if not all, of the members of the Association—to see the Institute universally acknowledged as the one representative body of the Profession. He had not been able to ascertain what position another society, which he would not name, held among architectural societies. If the time had not yet come, he hoped it was not far distant when the society to which he referred would dissolve itself and throw in its lot with the Institute. Then what did they find was the view of those within the Institute ranks? Well, there were many architects who considered that the Institute might do a good deal better than it did at present, that it might be governed a good deal better than it was, and there was a feeling abroad that the Institute required a good deal of alteration in the constitution of its council. It was not for him to say what were his views in regard to these matters, but it was a sign of the times, of the

democratic age in which we live, that such feeling should exist. Then there was a body of men in the country who looked upon the Institute as the leader of the Profession. He referred to the societies which are allied to the Institute. There was no doubt that those allied societies looked up to the Institute

AS IF ON A PEDESTAL.

and regarded it as exercising considerable influence for the benefit of the whole Profession. He had been much struck by this attitude towards the Institute at a recent gathering of the allied societies at Liverpool. At the same time, the societies did not forget to say that they constituted one of the elements of the power of the Institute. Now let them for a moment review the case from the Association's point of view. During the last few years the two societies had been in a closer alliance than existed when he first joined the Association. This union had made for mutual benefit. As they knew, the Association had for some years past been represented on the council of the Institute, and they thus had an opportunity of making their voice felt in matters vitally affecting the Profession, whilst at the same time they also improved their position as a teaching body. It was a matter of satisfaction to note that the Institute was to-day ever ready to help the architectural student, and though they were not of course prepared to offer practical tuition, they had during the last few years annually granted the Association a sum of £100, which they did not scruple to accept, regarding it as money which eventually found its way back into the coffers of the Institute in the shape of new members trained by the Association. In this respect the Architectural Association was accomplishing a work that was undoubtedly of great benefit to the Institute, for there could be no doubt that the success of the R.I.B.A. examinations had been very much aided by

THE SYSTEMATIC COURSE OF TRAINING

given at Great Marlborough-street. In this respect they had been working hand in hand with the Institute, and if they did not agree altogether with the way the examinations were carried out, they, at least, had to acknowledge that considerable benefits were derived thereby. He was sure the members of the Association would agree that they ought to do what they could to uphold and support the Institute, which was doing what it could to further the interests of the Association. Both societies were animated by the same spirit—that spirit in which they were endeavouring to raise the tone of the Profession and to advance their Art. The speaker regretted the unavoidable absence of the President of the Institute, Professor Aitchison, R.A., but he was pleased to see present one or two members of the council, including Mr. Caröe, whose name he coupled with the toast.—Mr. Caröe, in reply, said that no one could feel more strongly than he did the absence of Professor Aitchison, who was the only person fully qualified to return thanks for the toast. The present was not an occasion upon which they talked politics, whether politics as generally known or architectural politics, and he, therefore, did not propose to enter into any political question. He was sure he could say that the Institute as a body, and certainly as represented by its council, felt that their life-blood to a large extent ran in the veins of the Architectural Association. It was a truism that youth was the hope of age, and he certainly thought it was a truism that the Association was the hope of the Institute. He was fully aware of the increasing and excellent part which the various societies in the country took in the Institute's proceedings, but at the same time the governing body of the Institute and the Architectural Association were closer together here in London, and there was no doubt that the cordial feeling existing between the two bodies was not only of

IMMENSE ADVANTAGE TO THE PROFESSION

in general, but to each body; that this cordial relationship did exist was proved by the fact that the present was the seventh year that the Institute had contributed to the funds of the Association. The Institute looked to the

Association; it was grateful for the honour of this toast, and for the prominence given to it. What was most to be dreaded, the speaker proceeded, was the lack of enthusiasm. There were so many toils and turmoils surrounding the practice of their Profession, that the time required to organise and keep going these important societies was a serious matter, and therefore they required new blood and fresh ideas constantly grafted on to the old. He, for one, agreed with what Mr. Pratt had said as to the reform in the Council of the Institute. He did not know whether this sentiment would be echoed by every member of the council, but he had often thought that a rotary system, whereby the members should retire after a short period of office, would be attended by very desirable results, giving, as it would, a wider opportunity to others of entering the council, whilst at the same time leaving the return of old members possible by election. Many of his hearers had, no doubt, been struck by a model design for a church in this year's Academy, and it was delightful for the speaker, as a past member of the Association, and as a member of the Institute's Council, to find that this design was by a member of the Association, who had been trained in the Association's school. It was to men of this class, and those at the head of these schools, that the future of Architecture, and therefore the future of the Institute, depended. He thanked them heartily for the toast.—Dr. Garnett, in proposing "The Architectural Association," said that when he accepted the invitation to be present at that dinner he thought that the contract would be fulfilled in its simplicity, but that afternoon he had received a letter which he could only compare to

A BILL OF EXTRAS.

calling upon him to undertake a toast. He could not pretend to discuss the internal affairs of the Association, but he knew it was carrying on a most valuable, most efficient, and most important work. In the first place, its teaching for the examinations of the Royal Institute of British Architects, as carried on at its classes in design and watercolour drawing, was such as could not be obtained elsewhere. It was a matter of satisfaction that young architects were afforded these facilities for becoming acquainted with the properties and the limitations of materials. The younger members of the Profession would see the value of training their hands to use tools as well as pencils. But a work more important than this, which was being carried on by the Architectural Association, was its fortnightly meetings—meetings for mutual improvement, which was the best kind of improvement. Not only did they help one another by reading papers, but they were occasionally visited by experts, who read papers which could not be got at any cost from any other source. In this work the Architectural Association had been engaged for many years, and he hoped these meetings would go on increasing in popularity. The speaker further eulogised the objects of the Association, and remarked that a young member going to London might look to the Association for moral as well as intellectual strength, which was not, he thought, forthcoming from any other source. For all its work the Architectural Association was worthy of the admiration of them all, and they would all drink to the health and continued success of the Association. May it flourish for ever! With the toast he coupled the name of Mr. Hampden Pratt.—The President, in acknowledging the compliment, said this toast was, of course, always honoured at their annual gatherings. They trusted that the Association would exist, if not for ever, as Dr. Garnett had said, at any rate for many a long year. Dr. Garnett had seized upon the real vital points of their existence; the Association was an Association; no name could better express

ITS OBJECTS AND PRINCIPLES.

It was their endeavour to work together mutually as a band of young men, associated for mutual help and with a common desire to advance the Art they had adopted. The kindly interest that was taken in the Association

was shown by the great assistance received to-day from very many influential men in the Profession, who visited their schools of design and gave the students the benefit of their advice and their criticism. Such help could not be obtained in any other way but through the medium of their society, which had for its motto "mutual help." It would be the death of the Association if this bond of union were broken. As they looked around and saw how education was advancing, technical education more particularly, they recognized that the Association, if not threatened in its existence, was at any rate put upon its mettle, and they endeavoured to draw their bond of union closer. The object of the Association was not merely to give the students a systematic education, but they desired to promulgate the idea of friendship. They knew very well that if they attended the Association meetings in a mechanical way they would lose all heart and spirit in their work, a great feature of which, was, as had been said, their fortnightly meetings. The papers read there were such as could not be heard at any other Society in the country, and they often regretted that some of the older members did not attend to take part in the discussions, which were most valuable and most helpful, not only to students, but also to fully-fledged architects. The enthusiasm referred to by Mr. Caroe was certainly not wanting in the Architectural Association. It would be remembered that a matter debated at their Jubilee celebration a year ago was the

PROVISION OF MORE COMMODIOUS PREMISES for the Association. It would perhaps be thought that the day was very far distant when something in this direction would be accomplished. But it was no use being in a hurry, and he ventured to think their deliberation would ultimately be rewarded by very pleasing premises. At the present time they were looking for a site, and, although they had nothing to show at the moment, it would be seen that the matter had not escaped attention. He was pleased to say the Association had improved its financial position during the year, and the result of the last twelve months' working would be to show a better balance sheet than had been seen for many years past. He warmly returned thanks for the kindly interest that was ever taken in the Association.—Mr. Beresford Pite proposed "The health of the Lecturers and Instructors." The lecturers and instructors, he said, were practically those friends who amply filled up the gaps in their self-education; they went on the old patriarchal system; they were brought up in families; they were lodged and boarded, and were bound hand and foot by articles of indentures having clauses with hidden meaning which were never explained to the luckless signer, who, amid drawing-boards and specifications, was left to complete his education in something after the style of a fowl picking up grains in a farmyard. The speaker referred to Mr. Leonard Stokes as the originator of the idea of what was now the educational system of the Association. They had never anticipated the outside support which they now had in the shape of an

EXCELLENT BODY OF INSTRUCTORS.

For many years it was the rule of the Association to provide the examinees for the Institute examinations, but no examiners. To-day, however, the position was altered, and he hoped that the day was not far off when the Association would be fully represented on the Examining Board of the Institute. Why, a sight of Mr. Farrow sent a nervous thrill through the student when he marvelled what a large number of now flourishing architects had passed through his fatherly hands! What the Profession owed to him could not be lightly estimated. And now they passed to those charming men, who put them up to the necessary tricks in architectural practice. They had the quantity surveyor to teach them how to cook! Were they accustomed to eat their food raw? Did they think clients digested their accounts raw? The quantity surveyor was a cook—the architect supplied the material and the quantity surveyor cooked the

food. He was a most estimable cook, who instructed architects in the wiles and devices of the craft without any intention of making them quantity surveyors themselves. And as to the other instructors, who were untrammelled by the awful bogie of the examinations: personally, he had not enjoyed his studies until the examinations were all over, but now every fact he acquired with regard to practice and design gave an added joy to existence. One very necessary class which seemed to have been altogether omitted from their educational system was suggested to him the other day by a cynical friend. A man might have his head chock full of technical fact, and his fingers oozing with technical skill, said the friend, and yet fail to obtain any success in life. The thing that succeeds in life is cheek, and therefore was not the establishment of

PROFESSORSHIP OF PURE CHEEK

at all the Universities and technical schools of the country very desirable? He ventured to suggest that they, as architects, might fill up a few chairs. He coupled with the toast the name of Prof. F. E. Hulme.—The toast having been honoured, it was acknowledged by Mr. Hulme, who, in the course of his speech, referred to the Royal Palace at Kew, and pleaded that it should not be allowed to degenerate into a museum. The building was one of great interest, and of no small architectural value, and he hoped it would not be filled with objects which, however interesting, would be out of place there. The speaker referred to the great kindness shown him by students at the A. A., and on behalf of all the teachers and instructors he heartily returned thanks.—Mr. F. R. Farrow also acknowledged the toast. He was sure the Architectural Association would live as long as the Profession lasted. The society was founded on principles which must inevitably bring increasing success to the schools. Referring to the proposed new premises, he hoped the building would be of sound-proof construction, so that the lecturers would not be disturbed by what was going on in adjoining rooms.—Mr. A. H. Hart proposed "The health of the visitors," mentioning that he had received letters apologising for non-attendance from Professor Aitchison, Sir Wyke Bayliss, and Mr. Soanes, who had lately been returned to Parliament for South Norfolk. He coupled the name of Mr. Hare and Mr. Locke with the toast.—Mr. Hare, responding, said he came forward as a culprit. Sixteen or seventeen years ago he was a member of the Association, but he had allowed his membership to lapse. He had, however, followed the reports of the meetings with considerable interest. At the time he was a member the Association was very different from what it is now. It did not present the same advantages; in fact, there was

VERY LITTLE ORGANISATION

of any kind. The lectures were few, there was no regular curriculum, and, generally, there were not the same inducements then as now for a young man to become a member. He thanked the Association for its hospitality.—Mr. Locke also felicitously acknowledged the toast, referring to the cordial relations which had always existed between the Association and himself.—The next toast, "The Committee and Officers"—was proposed by Mr. Alfred Conder, who mentioned the names of Mr. Goldsmith and Mr. Hooper as officers who were retiring after three years of faithful service. He associated the name of Mr. Hooper with the toast.—Mr. Hooper, in replying, said he thought they might claim to leave the Association in as good a position, at any rate, as that in which they had found it. They came upon the Association as budding architects, and it was a satisfaction to them to know that the flower of the Association would take their places. Although retiring, they would do their best in an unofficial capacity to further the interests which everyone had so much at heart.—Mr. Carvill also acknowledged the toast, remarking that the secretaries had not a very easy time of it, but their duties were considerably lessened by the cordial

manner in which they were received and assisted by every branch of the Association.—Mr. Banister F. Fletcher proposed the next toast, "The President-elect,—Mr. Fellowes-Prynnne." There was no doubt that this was the most important toast of the evening—as every toast was—because it was a toast which they had to look forward to during the coming year. The retiring officers were more or less done with; they had got rid of them, and were now looking forward to another year. In Mr. Fellowes-Prynnne they had a president-elect who was in all respects admirable. Mr. Fellowes-Prynnne had been a member of the Association for many years. He had visited the classes, and had taken considerable

INTEREST IN ALL THE WORK

of the Association. In all these points the speaker thought Mr. Fellowes-Prynnne would appeal to them as the one man to be elected as their president. This, of course, was the case with every president as the years came round, but it was even more so in this case than in others. They believed Mr. Prynnne was the man who would guide the Association with success and honour. He did not think he need say more; Mr. Fellowes-Prynnne, of course, in the coming year would speak for himself. They would hear his voice on every occasion, and as he ranked next, as a speaker, to Mr. Pite, whom they regarded as their orator, he did not think he could enhance his value by any further laudation. He was a good fellow, was Prynnne, and if there was one thing more than another the Association desired it was a man who could take the chair and add some interesting and useful and sometimes blythesome words to the debates. The toast was musically honoured, and in replying Mr. Fellowes-Prynnne said he felt very fully the responsibility of his position, following as he was in the wake of very able men. Looking down the list he saw that the names of the past presidents included those of his genial friend Mountford, who was elected twice as president, their most worthy friend and admirable chairman, Mr. Caroe; their orator, Mr. Beresford Pite, and last but not least their most truly business-like friend, Mr. Hampden Pratt. One felt they had in these gentlemen what they would like combined in one president. Amongst themselves, they must feel as architects that the one great thing needed was a feeling of *esprit de corps*, which would perhaps tend more than anything else to success. They wanted the helping hand of those who were acknowledged to be the leaders of their Art, extending to the younger men; they wanted, in fact, a thorough good fellowship amongst themselves. Artists were always students. They wanted to feel that the studentship did not stop with the studentship of the Association. Concluding, the speaker fluently pleaded for a wider brotherhood in their ranks.—The speeches were interspersed with songs capitably sung by members of the Association, Mr. Constanduros, Mr. Carvill, Mr. Clapham, Mr. Wilson, and Mr. Leonard Butler providing the musical fare.

A COMMODIOUS new school was opened a few days ago at Gilvach, Bargoed. The architects were Messrs. James and Morgan, Cardiff; and the contractor Mr. T. Williams, Bargoed.

COLONEL HEPPEL has held an inquiry at Buxton re application from the Urban District Council for sanction to borrow £1020 for works of sewerage, and £500 for the purpose of contribution towards the cost of rebuilding Otter Hole Bridge.

THE will has been proved of Mr. James O'Byrne, architect, of Birkdale. He designed the Roman Catholic ecclesiastical seminary at Upholland, near Wigan, and the institution will substantially benefit by his will. The personal estate represents over £100,000, and, after providing for relatives, and leaving £1000 to the heads of the Capuchin monks in England, the residue goes to the Roman Catholic Bishop of Liverpool, to be used at his discretion. In addition he leaves to Upholland College his valuable collection of pictures, coins, books, &c., valued at £20,000. The numismatic collection is especially rich in Papal coins and metals.

FOUNDATIONS*

AS APPLIED TO LONDON BUILDINGS
AND RIVERSIDE FOUNDATIONS.

BY A. T. WALMSLEY.

(Continued from page 291.)

IN the Hennebique system of concrete construction, in addition to the use of iron bars or rods to resist tensile stress, a stirrup is inserted at intervals, with the object of holding up the tension members. These stirrups are placed nearer together at the ends of a beam than in the centre, and the system is designed, not only for floors, but for spreading the weight of a superstructure over an extended foundation on soft ground. The calculated strength is the resistance of the iron added to the resistance of the concrete. In the execution of a contract for demolishing an old building in Maiden Lane, London, and building a new one, three stories below ground and ten (subsequently reduced to seven) above, where the site adjoined a court 3ft. wide, upon the opposite side of which was a four-story warehouse, the contract arrangements did not permit of the removal of the soil of the court and the underpinning of the wall to the warehouse; so the ground had to be kept up with the superincumbent weights all round. The contractors timbered with 2in. polings, aided by 9in. and 12in. timbers, both for struts and waleings. This, however, proved quite inadequate at a depth of 30ft. to 42ft., the latter being the depth of the bottom of the trenches. The weight caused the 12in. logs to bend as much as 2in. in the distance of 5ft., at which the cross-struts were spaced. As a consequence, the houses all round, and particularly the warehouse across the court, began to

INDICATE SIGNS OF SETTLEMENT.

The thickness of the retaining wall was increased, and inverts introduced, and struts placed. Difficulties as to the projection of the area into the street prevented the contractors carrying the excavation to the full extent shown upon the plan when the excavation was commenced; consequently, at a later period, when the building appeared above ground, the front planking and timbers had to be taken out, about one-sixth more earth excavated along the frontage, and the ground re-timbered. When this process had reached about 30ft. out of the 42ft. an accident occurred. This timbering gave way at midnight and let into the basement of the building the whole of the earth above, due (as the contractor believes) to some soakage going on in the blue clay and causing it to spew out at the base. The gas and water mains in the narrow street became broken and the sewer injured. The site appeared to be smothered in liquid mud 30ft. deep in the trench. Probably, if sheet planks not less than 3in. thick had been driven close together, joint to joint, anxiety might have been relieved by the use of additional struts. The employment of 2in. poling boards—which the author understands to mean boards 2in. thick inserted behind the waleings at slight distances apart—is only effective where the ground is self-supporting, or nearly so. In ground of a loose kind, close sheeting in all such excavations is absolutely necessary. In the construction of

THE CENTRAL LONDON RAILWAY

the clay has been reached at a depth of 29ft. 6in. below the surface at the Bank Station adjoining the Royal Exchange, at 20ft. at Chancery Lane, and 21ft. 3in. at Davies Street, Oxford Street; the excavation in the shafts indicating 12ft. of made ground over 18in. of loam and 16ft. of gravel at the Bank Station, 6ft. of made ground over 14ft. of gravel at Chancery Lane, and 12ft. 6in. of made ground over 8ft. 10in. of hard mud in Oxford Street. While at some places the ballast has been found almost immediately below the surface, there are other places where the solid stratum of gravel underlies marshy ground to a depth of 15ft. or more. In underpinning an existing structure when building an adjoining structure,

the foundations for which are required to be at a greater depth than the existing building, the work should be set out so as to be executed in sections of about 5ft. to 10ft. in length, one length being completed before the adjacent length is commenced, and each succeeding section inserted, so that one or more undisturbed section or space of 5ft. to 10ft. is allowed to exist between the section in course of progress and the last finished section. The wall which is underpinned will thus stand on piers 5ft. to 10ft. long, with undisturbed ground intervening. When the stratum of earth on which the piers are built does not prove strong enough to sustain the load upon the piers—an occurrence which cannot be ascertained until excavations are made—the intervening bays should be excavated and the foundations made continuous; but in this case

THE PROCESS OF NEEDLING UP

is indispensable. Care must be taken in fixing the needles to leave room to excavate and to fill in between needles before drawing them; also to employ a proper use of raking and shoring pieces and filling in of window openings as may be essential to obviate danger to the structure, and take care to build up the section with the quality of brickwork suitable for foundations. In underpinning work, brickwork is usually preferred to concrete, because it is easier to ensure tight packing under the old work. Concrete has, however, been successfully used to underpin buildings when carried up to within about 1ft. or 18in. of the old work, and then allowed to set for at least a couple of days before ramming in the remainder with iron rammers, the concrete so used being in a semi-dry condition, and care being taken not only to board up the face and wedge the boards tight against the face of the plastic concrete, but to hammer the boards well in, so as to ensure uniform support to the concrete until it has set. Having underpinned in narrow sections of brickwork upon a concrete foundation, the next step is to grout up and properly make good to existing work, and allow this to set for, say, seven days before the next section is disturbed.

WHERE CONCRETE WITHOUT BRICKWORK IS ADOPTED

for underpinning the time needed for setting is longer, and as underpinning is usually employed in piers, the employment of brickwork is a more speedy operation. In the case of some residential chambers being built upon the site of Cleveland House, St. James's Square, consisting of eight floors, including basement, to the design of Messrs. Rolfe and Matthews, it became necessary to underpin the old wall of the adjacent building, 20, St. James's Square, under the care of Mr. T. Garratt as architect. The old building, the wall of which had to be underpinned, consists of five floors, including basement, and the strata is dry sand. The whole of the underpinning consisted of picked Fletton bricks in cement, resting upon a good bed, attained at a depth excavated in the sand. No concrete was used under the old wall of this adjacent building. The underpinning was carried down in piers under the existing footings to 12ft. to 13ft. below the basement floors, in places where

STEEL STANCHION FOUNDATIONS

were introduced in the new building to carry the floor girders. The remainder of the wall was underpinned to an average depth of 5ft. 6in. below the basement floor, which is about 11ft. below the road level, or a total depth of about 16ft. 6in. The foundation to the walls of the new building are concrete, and to ensure a straight joint between the old and new building, thin sheets of iron were placed between the brickwork of the old building and the concrete of the new building in the foundation, and dry sand filling between the old and new work above this level, so that the new work can settle quite independently. The old wall of 20, St. James's Square, varies from 18in. to 27in. in thickness, the adjoining new wall of the residential chambers being 22½in. at the basement floor. The excavations were made so as to build piers in 4ft. to 6ft. lengths, leaving a similar length between each

pier undisturbed until these piers were set, a minimum of four days for this purpose being required. The intervening space was then cleared, and the underpinning completed to form a longitudinal continuous support. Where cross walls appeared, the underpinning was carried about 2ft. 6in. under the cross wall beyond the longitudinal underpinning. In the improvements recently effected

AT THE LORD WARDEN HOTEL, DOVER,

several interior walls upon the ground floor were removed to form an area facing the main entrance suitable for a lounge. It being decided to carry the stanchions, which had to be inserted to support girders carrying the upper walls upon the lower existing walls, Messrs. Handyside and Co., the contractors, introduced 10in. by 6in. rolled steel joists 6ft. long, as distributing girders, over which a cast-iron bed-plate rested, and between this bed-plate and the foot-plate to the stanchion very flat steel wedges were introduced, tapering from 1½in. to ¼in. in a length of 25in. By this means further deflection was obviated, and subsequent cracks in the existing upper wall avoided.

IN THE BUILDING OF THE NEW CARLTON HOTEL,

Haymarket, the old walls of the Opera House foundations were left intact, except where the contractors found it necessary to cut through them for purpose of the new work. The formation was tested to 36ft. 6in. depth below street level, and found to be loamy sand, suitable for foundations. The new front walls are all solid foundations upon continuous concrete. Portland cement concrete (six to one) 3ft. thick, was placed under the main walls and under the intermediate walls, everywhere of the same thickness except under the 9in. walls, where 2ft. thickness was adopted, and under stanchions, where a base 9ft. square was used, 4ft. in depth. There is not more than 2ft. difference of level in the top of all the concrete, a difference necessary to suit the floors. The width and depth of concrete employed for this building is as follows: For 9in. walls, 2ft. 6in. wide, 2ft. thick; 14in. walls, 3ft. 4in. wide, 3ft. thick; 18in. walls, 4ft. wide, 3ft. thick; 1ft. 10½in. walls, 4ft. wide, 3ft. thick; 2ft. 3in. walls, 5ft. 6in. wide, 3ft. thick; 2ft. 7½in. walls, 6ft. 6in. wide, 3ft. thick. The solid columns, 8½in. in diameter (hammered steel ram) are carried on a cast-iron base plate 2ft. 8in. by 18in., seating on five rolled steel joists, 18in. by 7in., embedded in the concrete, each 7ft. long. In some cases four rolled steel joists are used, carrying a solid rolled steel column 7in. diameter. The

STANCHIONS ARE EMBEDDED IN THE BRICKWORK

where walls permit, and carry the wall girders. All brickwork is in cement throughout. For large weight, solid blue brick piers in basement support stanchions. The wall next the Arcade had to be underpinned by piers 18ft. deep. This wall formerly took the roof of the Arcade only, but now supports the side wall of the hotel, and seven floors. Six distributing rolled joists, 10in. by 4½in., were inserted to carry the weight of the upper wall on top of crown resting on brickwork. A stanchion was built into each pier, leaving about 2ft. of the face-work next the Arcade intact. New arches were inserted, using the old arches as centres. The old arches were then cut out and the new piers carry the Arcade roof and hotel wall at this side. The stanchions, with the surrounding brickwork, carry the springing of the arches. Two 12in. by 3in. channel sections, with two 16in. by ½in. plates, form the stanchion, 13in. by 16in. over all. Four rolled joists carry a 16in. square stanchion, 20ft. by 2½in. long, with steel  rivetted to the stanchion at the base, and an 11in. column above this, 22ft. 5½in. long, making altogether 42ft. 8in. in height. The stanchions and columns are employed for interior walls only. The 7in. columns, 24ft. 3in. over all, vertically have a base plate 2ft. by 18in., and the construction erected by Messrs. R. Moreland and Son is an interesting example of the use of solid steel stanchions and of distributing girders in foundations arranged with the aid

* A paper read before the Architectural Association on May 20, 1898.

of a cast-iron base plate to give a pressure not exceeding $1\frac{1}{2}$ tons per square foot. Mr. H. L. Florence is the architect.

AT GREAT YARMOUTH,

within two years of the building for the Town Hall being completed, it was found that the western portion, near the river, was settling considerably, and levels were taken monthly, with the result that Mr. Cockrill, the borough surveyor, found these settlements were continuing, especially after heavy rains, or very high or very low tides. The late Sir J. Bazalgette was called in, and he recommended underpinning and building walls under present foundations with concrete blocks. Borings were made showing 6ft. of made ground and 18ft. to 20ft. of soft ooze, below which was gravel. Mr. Cockrill carried on the works under Sir Joseph Bazalgette's instructions. The method of procedure was to sink two cylinders entirely without pumping, a grab being employed to remove the soil inside cylinders, and divers to level and sink them. These were sunk to a depth of 40ft. A trench was opened from the cylinder out to the north-west corner of the building, but immediately on commencing to pump, a settlement was caused in the building which so frightened the municipal authorities that they stopped the works, and, of course, as the water rose in the soil, this finished all chance of doing anything further with it. Mr. Cockrill, however, is very strongly of opinion that if they had allowed the matter to have gone on he could have underpinned the corner in forty-eight hours, and when one corner was done it would have been a comparatively easy job to have continued. Sir Benjamin Baker next came on the scene, and with Sir Joseph Bazalgette recommended widening the present foundations by using the concrete blocks made for underpinning. The committee, however, resolved to pull the west part of the building down, but subsequently, upon the advice of Mr. F. E. Duckham, screw piles were introduced. Mr. Duckham's plans consisted of putting rows of cast-iron screw piles at intervals of 9ft. inside and outside the main walls, each about 23ft. long, screwed approximately 3ft. into the gravel banks. On the heads of these piles, longitudinally and parallel with the wall, were placed girders about 15in. deep, and across them, suspended by strong screw bolts, steel joists were placed under the concrete foundations, and then screwed up tight to the concrete, the whole being surrounded with concrete. No settlement has since occurred. The subsoil consisted of a gravel bank, underlying 16ft. to 18ft. ooze and 5ft. or 6ft. of made ground into which the trenches for the concrete foundations were cut. The removal of the water from these trenches

TENDED TO JEOPARDISE THE BUILDING.

The piles employed were 2ft. 6in. and 3ft. diameter, filled with concrete so that in the event of the cast-iron becoming injuriously affected by the soil of the district the internal concrete columns would sustain the superimposed mass. In the construction of the Liverpool Overhead Railway, wrought-iron girders placed 22ft. centre to centre, at a normal span of 50ft. and at a height of 16ft. above the roadway, are supported by columns built of two steel channels and two plates grouted at their base into cast-iron shoes, which are anchored to concrete foundations by bolts, the concrete footings being arranged so as to distribute a pressure of one ton to the square foot over the surface of the made ground on which they stand. The safe bearing power of various kinds of ground may approximately be stated as follows: Made ground, when dry, as firm earth will sustain, from 2500lb. to 3500lb. per square foot, or, say, from 1 ton to $1\frac{1}{2}$ ton per square foot; but if the subsoil be of an alluvial character, or quicksand, it will be prudent to allow only $\frac{1}{2}$ ton to $\frac{3}{4}$ ton per square foot, and the same for soft clay near the surface; whereas with moist clay we can allow from 1 ton to $1\frac{1}{2}$ ton per square foot; compact clay, nearly dry, from 2 tons to $2\frac{1}{2}$ tons per square foot; dry, compact clay, of considerable thickness, from 3 tons to 5 tons per square foot; loose sand,

from 1 ton to $1\frac{1}{2}$ ton per square foot; compact sand, from 2 tons to 3 tons per square foot; compact sand, prevented from spreading, from 5 tons to $7\frac{1}{2}$ tons per square foot; ordinary gravel and sand, from 2 tons to 3 tons per square foot; but, if the same be compact, dry, and prevented from spreading, from 4 tons to 6 tons; while ordinary rock would safely carry 9 tons per square foot. In the case of the Tower Bridge, it was thought expedient to limit

THE PRESSURE ON THE LONDON CLAY

upon which the piers rest to 4 tons per square foot. When the bridge is loaded to its utmost capacity, it is calculated that the granite bed under the columns of the towers sustains 16 tons per square foot, and the Staffordshire blue brickwork immediately beneath the granite 10 tons per square foot. At the Imperial Institute, designed by Mr. T. E. Colclutt, the pressure produced by the foundations upon the blue clay is estimated to be $2\frac{1}{2}$ tons per square foot. The main walls are continuous, but the wing walls are carried by girders attached, in some cases, to stanchions built into brick piers, so as to obtain easy communication in the basement area for pipes and storage connected with exhibition purposes. The stanchions, where introduced, are 14ft. 5 $\frac{1}{2}$ in. over all, and stand on concrete foundation. The outside walls are carried down 14ft. to 19ft. below street level. Clay, when dry, and retained or excavated to a flat angle, is a safe foundation; but mixtures of sand and clay are bad, the sand admitting water and the clay retaining it. In such a soil, 2 tons per square foot of foundation is sufficient to assume. Landslips in clay occur when a clay bank is left insufficiently protected or at too steep a surface. In many parts of the Midlands, where it is the immediate subsoil, structures built thereon are apt to slip, and end walls of houses to crack owing to the shrinkage of clay due to excessive dryness. A landslip occurred on the South London line of the London, Brighton, and South Coast Railway, upon the south side of the line

AT DENMARK HILL STATION,

where the railway passes in a cutting, having an average depth of 25ft. along the side of the hill rising to the southward, and consisting of London clay. The slopes of the cutting were laid as flat as the limits of the land acquired would allow, and, in order not to encroach on the public road called Champion Park, a surcharged retaining wall was employed to uphold the slopes. For a period of about twelve years after the railway had been opened for traffic the retaining wall appeared quite sufficient to withstand the pressure of the earth behind, although some slight slips occurred on the surface of the slope; these being dealt with in

the ordinary way—by taking out the slips and filling up the space with chalk. Later on, owing to a movement in the wall itself, more vigorous measures were adopted, and heavy concrete buttresses were put in below the foundations of the wall, and brought up to the level of the platform. This remedy answered for a time, but the mischief was still going on, and during the winter of 1881 made itself apparent by a further movement of the wall, a sinking of the roadway in Champion Park, with a corresponding rising of the permanent way, which was lifted 2ft. It was, therefore, decided to put in another wall at the back of the existing one, sufficiently deep and heavy to resist the increasing pressure of the moving clay. This was done by the construction of a wall 12ft. in thickness in Portland cement concrete, the foundations being carried down to a depth of 18ft. below rail level into the solid ground, undisturbed by the slip. In addition to this wall, which was built for a length of 400ft., transverse counterforts, 5ft. in thickness, were put in about 13ft. apart, extending from the back of the wall up the slope to the road above, a distance varying from 20ft. to 50ft. The cause of the slip was probably

OWING TO THE ACCUMULATION OF WATER

in the ground forming the slope behind the wall. The presence of the water arose from two causes. (1) The flatness of the public road, and the non-provision of any surface drains to carry off the water for almost the whole length of the station, except at its extreme end. (2) The existence of a sewer passing along Champion Park near the top of the railway slope, which probably was in a leaky condition. The water consequently found its way through some crevices or sandy veins in the clay, thereby increasing the pressure against the wall to such an extent as to cause a forward movement of the clay, which the wall was unable to withstand. The remaining wall at the west end of the station also showed signs of moving, and this was strengthened by building raking-buttresses in cement brickwork, with intervening arches against the face of it with concrete foundations carried down to a depth of 10ft. below the footings of the old wall. Three concrete counterforts, each 12ft. by 10ft., and 28ft. high, carried down 10ft. below rail, were also introduced at the extreme west end of this retaining wall. About 10,000 cubic yards of concrete were put in. The works enumerated above were commenced in December, 1881, and completed by August, 1883. The works as carried out have proved effectual in arresting the movement of the earth, and no further trouble has been experienced at this place. The following table shows the angle at which different materials may safely be allowed to have sloping banks:—

TABLE OF ANGLE WITH HORIZON.

The Farringdon Street bridge of the Holborn Viaduct is remarkable as having a platform constructed of cast-iron arches and floor plates, the only wrought-iron employed being for the connecting bolts. The old bed of the Fleet River crossed the site where the viaduct is carried across the valley, and the bed of the existing Fleet sewer was about 22ft. or 23ft. below the old level of Farringdon Street at the point where the principal arch of the viaduct spans that street, upon the skew. This bed is clay. The scare created as to the fracture of columns or masonry in the piers was due entirely to bad face-joints in the bedding of the granite work. There was evidence of stability in the foundations, as not the slightest movement had taken place. The excavations for the foundations were carried 7ft. and over, below the old bed of the river into the solid blue clay and concrete. The foundations of the Great Northern Railway Company's goods station in the Farringdon Road are carried down to a depth of 16ft. below the rail level. The piers are of Staffordshire blue bricks set in cement, and are built upon footings of concrete that rest upon the London clay. The Great Northern Railway Company constructed an additional tunnel under some large warehouses in the Brewery Road, Islington, without the removal of any of the heavy stock contained in the warehouses or compensation for stoppage and loss of trade to the owners. The tunnel was built in 6ft. lengths, and as each length was tunnelled out it was arched in at once, and neat cement worked in by hydraulic pressure between the arch and the ground above, each length being completely finished before a fresh one was started. Messrs. Holland and Hannen, of Bloomsbury, London, constructed at the Surrey Commercial Dock some new warehouses in the South Dock

ON CONCRETE PIERS

varying in depth from 22ft. to 29ft. The borings showed the strata in various positions on the site to be in most cases made ground, blue clay, peat, silty clay, sand, and gravel. There were altogether some 250 pier holes to be excavated 4ft. 6in. square, and averaging about 20ft. below the surface of water in the dock immediately adjoining. It is obvious that to have kept each pier hole separately pumped out during operations would have proved an endless task. A large sump hole was therefore formed in the centre of the site, and by these means the water strata was tapped, and by constant pumping the pier holes were kept sufficiently dry to work in. Some considerable difficulty was experienced with the pumping machinery at the commencement, as ordinary pumps were useless in consequence of the large amount of sand extracted with the water. Centrifugal pumps were tried, but without success, and eventually a Murray's endless chain pump was erected which worked satisfactorily until the pier holes were completed.

(To be continued.)

The female sanitary inspector of the St. Pancras Vestry having, in pursuance of her duties, been refused admission to the North London Collegiate and Camden School for Girls, in Sandall Road, counsel's opinion (that of Mr. Herbert F. Manisty) was taken as to the powers of inspection possessed by the Vestry's officers under the Public Health (London) Act, 1891. Mr. Manisty was of opinion, as reported to the Vestry, that subject to proper notice given, specifying the works the sanitary authority desired to examine, the sanitary authority had power of entry. As it was desirable that their power of entry should be absolute, and not subject to the condition that the Vestry had some ground for believing that nuisance *prima facie* existed, he suggested that the opinion of the High Court should be taken on a special case stated by the parties.—The Public Health Committee recommended that notice as settled by counsel be served, and that in the event of admission being still refused the Vestry's solicitor be instructed to take the necessary steps for obtaining a judicial opinion of the High Court, as advised by counsel.—The recommendation was adopted.

THE WESTMINSTER BUILDING DISASTER.

"CULPABLE NEGLIGENCE OF THE ARCHITECT."

THE inquiry into the Westminster building disaster was resumed on Monday week, when Mr. Pawley, architect of the ill-fated building, recalled, said he had followed the profession for about fifteen years, and had never had fault found with his work prior to this affair. There had never before been a fatal accident on any of his buildings. After evidence as to the weight of the brick pier, witness said he had given orders that the centering was not to be struck. He did not think the omission of the stanchion to which frequent reference had been made would account for the accident. Some of the alterations in the plans were made owing to the desire of the Government that brick partitions should be used instead of those of glass and wood.—Mr. H. H. Collins, district surveyor for the eastern division of the City of London, said his firm conviction was that the cause of the accident was the

UNFORTUNATE WITHDRAWAL OF THE CENTERING

before the concrete had properly consolidated. He had examined some of the concrete which had not fallen, and found it well mixed. He thought it very feasible, the witness said, in continuing his evidence on the following day, that the concrete caved in between the lacing joists as had been described by one of the previous witnesses. The concrete would then fall in large or small pieces, having no centering underneath it, and if it fell through a depth of 22ft. it would probably crash on the ironwork underneath, causing it to act as a lever on the pier and throwing it over. He thought that the ironwork of the roof would have stood in its skeleton form had the pier remained in its position. It was the falling of the pier that caused the iron girder of the roof to go. Had the pier been larger it would not have withstood the falling concrete. The probable spot at which the pier would give way, if it collapsed from its own inherent weakness, was at its base on the first floor. What had been termed "a pier" was in reality a series of piers. The total weight of the brickwork of the series of piers was 27 tons 19cwt. The total weight on the pier at its base at the time of the accident was 45 tons. It would require a force of eight times 61 tons to crush the pier.

BRICKWORK IN CEMENT

required from 60 to 70 tons per foot super. to crush it. His authorities for that statement were Professor Rankin and Professor Unwin. One could put up very large buildings such as they had in America if bolts were used on each floor, and provided there was a base sufficiently large. The addition of a stanchion would have decreased the burden that the pier had to bear, and it would have been wise to have put up a stanchion.—By Mr. Ellis Griffith, M.P. (counsel for the roof contractor): The only fault he found with the building was that the centering was removed too soon. He did not believe the evidence of the witnesses who said that the concrete struck the pier, although they might have imagined that that happened.—Mr. William Eve, of Union Court, Old Broad Street, a Fellow of the Surveyors' Institute, said he had had considerable experience in the construction of buildings. He had examined Abbey Mansions and was of opinion that the load on the brick pier weighed 53½ tons. That he considered to be a safe weight. The fact that the pier was found in large pieces showed that

IT WAS OF GOOD CONSTRUCTION.

He would not like to strike the centering of a concrete roof until after the expiration of fifteen days, and he would prefer to allow a lapse of twenty days for the concrete to solidify. He thought that the premature striking of the centering was the cause of the accident, and the fact that the building fell while the centering was being struck confirmed him in that view. His idea was that the concrete fell on the carriage girder of the seventh

floor, a distance of 11ft., pressing the girder down and prising up the pier. The pier, no doubt, dragged down the girder joists and the brickwork.—By Mr. Ellis Griffith: He did not agree with everything Mr. Collins had said. He had known many buildings to be constructed without plans, but he had not so constructed them himself. It was improper, in his opinion, to fix a girder in a flue without a stanchion being put in. Some of the concrete must have fallen before the pier lurched. Without the stanchion the pier would not have been sufficient to support the building when it was occupied.—Mr. E. A. Gruning, vice-president of the Royal Institute of British Architects, said centering should not be struck until about three weeks after the concrete was laid. He had heard the dates upon which the roof was concreted and the centering struck, and did not think the concrete could have hardened sufficiently to render the striking safe. In his opinion it was the

FALLING OF THE CONCRETE ON THE GIRDERS that caused the pier to collapse. It would have required a very much larger pier to have resisted the falling of the concrete roof.—Mr. Thomas Blashill, F.R.I.B.A., F.S.I., superintending architect of metropolitan buildings and architect to the London County Council, was called at the hearing on Wednesday, and said he attended, by request of the Council, to give expert evidence. He had examined the south block of Abbey Mansions and had heard the evidence. There could be no doubt that the collapse of the interior of the building was due to the fall of a detached pier, whether caused by the fall of concrete or not. With regard to the strength of the pier, he did not doubt that it was built of fairly hard stock bricks set in cement mortar. He made its horizontal area 7ft. at the bottom. On the fifth floor level its horizontal area was diminished to 5ft. It was connected on one side to a wall which ran up the basement story and the ground story, subject to any opening which there might have been in it. He made the weight of the pier itself, together with the weight of the floor and the roof and their girders complete (so far as executed at the time of the accident) round the level of the basement floor, to be 48½ tons. This was rather less than other witnesses had made it, but in this calculation no account had been taken of the 4½in. party wall which was in course of construction, nor of the

STORING OF BUILDING MATERIALS

The first question was the resistance of good stock brickwork in cement. That depended largely on the height of the pier in proportion to its smallest horizontal dimensions. Its total height of 105ft. or thereabouts was entirely out of proportion to its width, but he did not make that great height the basis of calculation. He attached very little importance to the wall with which it was connected on the lower story. The wall was built in mortar while the pier was in cement, and any considerable strain on the pier would break its connection with the wall. A pier of proper construction, stiffened at intervals of about 11ft., might with some qualification be dealt with in separate sections, but in order to justify this the floors must be quite rigid, and the construction of the pier, especially where it was connected with the floors, must be perfect as regarded the strength and the arrangement of its parts. If such a pier should be in any degree out of the upright or badly constructed, or subject to the least pressure, except perpendicularly, it must be very materially weakened, and in this way its great height would render it liable to excessive stress in particular parts. Subject to these observations, he had endeavoured to find out the crushing strain and the safe load of

GOOD STOCK BRICKS AND CEMENT.

On this point there was great variety in the published experiments. The crushing strength of stock brickwork was given at from 18 tons to 30 tons, and even as high as 70 tons per foot super., and the proportion of safe load to crushing load was given by various authorities at from one-fourth to one-twentieth. But he believed it had long been the practice of

architects to adopt a load of from five to six tons per foot super. as a safe load. Professor Unwin, in speaking of some recent experiments made by the Royal Institute of British Architects, said that from four to seven tons was a safe load, and that seven tons was the extreme limit with prudent architects. He thought that recent experiments showed that the safe load would be under the seven tons per foot given by the witnesses, which was as much as one-half or one-third of the pressure which had crushed a full-sized pier in experiments. On each floor the regular brickwork was interrupted by stone templates going over the whole surface of the pier and by girders. The girders ran

THROUGH SIX COURSES OF BRICKWORK.

In no case did the height of any girder coincide with any course of brickwork. No experiments such as had been alluded to in this inquiry had ever been made, so far as he knew, on brickwork of this kind. The strongest arrangement as regarded the big girder would have been to have fixed it within the middle third of the area of the pier. Any departure from that position materially weakened the strength of the pier. This girder was within 6in. on each floor of the west end of the pier, and bore principally upon one corner of it. In this way the pier at each floor was seriously weakened in its construction, and, besides, was seriously overladen. He had no doubt that at the time of the accident the lower half of the pier, at least, was in certain places dangerously overladen, and that this danger was increasing daily. It might have collapsed at any time from that cause, together with the weakness of construction. Upon the occurrence of any appreciable shock it was nearly certain to collapse. It was not necessary, in his opinion, to assume a fall of the concrete from the roof, and, had the disaster not happened at the time when the centering was being removed, a fall of concrete would hardly have been suggested as the cause of the accident. As to the concrete roof, he was told by the engineer and chemist to the London County Council that the cement which they had tested was very good. The material of the furnace clinker or ashes must have varied considerably, as some of the concrete fell in large pieces, and some were weak. He believed no coke-breeze was found in the concrete. He had used coke-breeze very largely, and it was not like this. He would not think it

UNSAFE TO STRIKE THE CENTERING

of coke-breeze concrete at the time the centering of the roof of the collapsed building was struck. They struck centering under coke-breeze floors, 4½ in. in thickness, in a week or ten days, but the centering in this case was struck in less than a week. A flat roof given that time should have carried itself, but if a portion was of very bad quality it might fall. He had very little doubt that, however it might have fallen, it would have caused the collapse of the pier. He thought that if the pier gave way, without the shock of the concrete, at any part of its height, there would be a short period during which it was going downwards through the crushing of the brickwork, and horizontally in the direction of the staircase. Then after a short period the whole building would collapse, as had been described. If the roof concrete gave way he should expect it to break about the middle in the direction of its length, and under conditions, which he described, it would break into two pieces, roughly measuring about 10ft. by 2ft. each, or 20ft. super.—By Mr. Hugo Marshall (for Mr. Pawley): He did not think the upper part of the pier was overloaded. The danger of overloading came somewhere towards the bottom—the second or third floor. He thought that

FIVE TONS PER FOOT SUPER.

was a safe load, but he was quite in the hands of scientific men on the subject. On the first floor the load weighed 5.64 tons. It was there that the danger occurred most. He could not say that all the danger was below the third floor, as there were no ties on the fifth floor. Any kind of shock such as that caused by a scaffold-pole falling end on a girder would

have been likely to cause the collapse. He could not go so far as to say that the falling of the concrete knocked the pier down; he did not know how much fell. If the concrete fell first, then it no doubt caused the collapse. It was true that such a shock might destroy a properly-constructed building. He did not consider seven tons per foot super. a dangerous load for this pier.—Mr. Marshall: Do you agree with the other expert witnesses that even if the pier had been reasonably larger it would have been crushed by the falling concrete?—I have some difficulty in answering. But if that pier had been of sufficient size, and the concrete had been so soft as to fall, I should have considerable hope that the building would stand.—By Mr. Thompson: Assuming that the perpendicular, the ties, and the foundation of the pier were perfect, the fall of concrete might bring it down.—By Mr. Gardiner: Any appreciable weight falling on the building might have caused it to collapse.—By Mr. Kent: Seven tons per foot super. was

THE EXTREME LIMIT

for a prudent architect to adopt for a safe load. The actual load on the pier was 6.9 tons per foot super.—Mr. Gruning, surveyor, recalled, said that in his judgment a safe load to put upon the pier, having regard to its construction and all the details, was seven tons per foot super. There was nothing in the construction of the pier to suggest to his mind that it was the cause of the accident.—The inquiry terminated on Thursday after a hearing of twelve days. The Coroner occupied four hours and a half in summing up the mass of contradictory evidence adduced. He directed the jury that the question they had to decide was which of the two suggested causes the collapse of the building was attributable. One was the premature striking of the centering of the concrete of the roof when it was not properly set, and possibly not properly mixed, and the other that the pier was constructed in a faulty manner. It had been suggested that the materials used in the construction of the pier were

FAULTY AND IMPROPERLY PUT TOGETHER, but in this connection the Coroner directed the jury to entirely disregard the evidence of Collins, the stonemason, as it was wholly unsupported and disproved in many important particulars. The question they had to decide as regards the pier was one of design, and they would have to judge whether Mr. Pawley or anybody else was guilty of mistaken or of

CULPABLE NEGLIGENCE.

The question was purely one of criminal responsibility, that of residual responsibility being for another Court. The Coroner then directed attention to what he considered to be discrepancies in Mr. Pawley's evidence. In conclusion, Mr. Troutbeck trusted that the whole question of the local control of buildings would be reconsidered as a matter touching the public safety, and to prevent the repetition of such a disaster. After a consultation of an hour's duration, the jury returned the following verdict:—"That the deceased met their death through injuries received from the collapse of the south block of Abbey Mansions, the cause of which collapse was owing to faulty design in the construction of the pier, due to

THE CULPABLE NEGLIGENCE OF THE ARCHITECT.

The jury are of opinion that some of the concrete of the roof was carelessly mixed and of inferior quality, but that it was not the initial cause of the collapse. In the opinion of the jury greater powers of public control should be exercised over buildings.—The Coroner: There is only one construction, I fear, to be placed upon your verdict. It is a verdict of manslaughter against Mr. Pawley.—Mr. Marshall then submitted that Mr. Pawley had no duty to the deceased, and that even if he had, and was guilty of a breach of duty, that breach was not the proximate cause of the accident.—The Coroner: That must be argued in another Court. As Mr. Pawley has shown no desire to assist the Court, I will fix his bail at £200 in his own recognizances, and £100 in those of his solicitor,

Professional Items.

BAKEWELL.—The new vestry which has lately been built at the north side of Bakewell Church has been formally opened. The vestry is from designs by Mr. Naylor, architect, of Derby, and the masonry and building was entrusted to Mr. T. Allsop, builder, of Bakewell. The building is of Stanton stone. Externally, the style is after that of the church (Early Gothic), with embattled tops and windows.

BRISTOL.—The Fairfield Road Higher Grade Board School and School of Science will be completed in the autumn. The range of buildings has been erected on a three-cornered site on the sloping side of a hill, the mixed school, science school, and infants' school being grouped in triangle fashion so as to leave a small playground in the centre and larger playgrounds in two of the angles of the land. The external masonry is of pennant laid in erratic courses, and relieved by red brick window and door openings and terra cotta decorations. Owing to the scheme being a costly one, the decorative element was cut to the narrowest limits. The design has been furnished by Mr. W. J. Bernard, and the contractor is Mr. John Perkins, of Redland.

CHICHESTER.—The monument erected at Chichester Cathedral to perpetuate the memory of Bishop Durnford was unveiled last week. The monument is erected under the easternmost arch of the south-east chapel of the nave (St. Clement's Chapel), between the chapel and the south aisle. It consists of an altar tomb of Clunch, having square tracery panels divided by panelled niches of Purbeck marble, containing shields bearing emblems of the Passion. The tomb has a moulded base and slab of Purbeck marbles, and upon the slab rests the recumbent effigy of the late Bishop in Episcopal habit (including robe and mitre), and executed in alabaster, carefully selected and polished. Above this is a beautiful piece of workmanship in the form of a rich canopy of Clunch, consisting of cusped arches and groining, supported at the ends by shafts, in the centre by penchants carved with angels. At each end of the tomb there is a traceried panel partly pierced and having a small niche, with the figure of St. Richard at one end and St. Wilfred at the other. At the corners are figures of the four Evangelists, and the whole canopy is crowned with richly carved cresting and pinnacles. The design was prepared by Messrs. Bodley and Garner, of London, and the execution of the design was entrusted to Messrs. Farmer and Brindley. The Clunch stone used for the canopy is a fine grained stone much in use for monuments and delicate work.

DEVONPORT.—A new south aisle which has been added to St. Stephen's Church, Devonport, was consecrated a few days ago. The aisle, which occupies the site of a demolished house, is quite in keeping with the contour and style of the church, is of Gothic design, will seat about a hundred people, and has cost over £3000. In addition to the aisle itself, there has been built a sacristy and side chapel, provision being made in the sacristy for a side altar; the steps leading up to this are of Devonshire marble, while Italian mosaic has been utilised for the laying of the intermediate places. Messrs. Pethick Bros. were the builders, and their admirable work was executed in exactly one year.

EDINBURGH.—The memorial stone has been laid of the new Craigmillar Park Free Church. The plans have been prepared by Messrs. Sydney Mitchell and Wilson, architects, 13, Young Street. The church is cruciform in shape, and consists of a nave, aisles, transepts, and a semi-octagonal apse. The tower is in the north-west corner, and in it the main entrance is placed. The doorway is arched and richly moulded, and above it is an elaborate panelling in stone. The vestibule between the doorway and the church is spacious. Over it is placed a western gallery, which is

reached by a wide and easy stair. The nave is divided into three bays by circular columns; with moulded capitals, and these carry obliquely-pointed arches. The aisles are used entirely as passages, and contain no seats. The apse is separated from the church by a handsome and lofty stone arch, and it is lighted by three tall and narrow windows with richly traceried heads. The pulpit, which is of wood, is placed at one side of the arch between the church and the apse, and the communion table, reading desk, and font are placed in the apse itself. On the north side of the apse, and opening into both it and the north transept, by means of stone arches, is the organ-chamber. The roof of the apse is treated as a semi-dome, and is lined with wood and decorated with moulded ribs of the same material. The roof of the nave and transepts is open timbered, with the principals treated with considerable elaboration.

ILFORD.—Cardinal Vaughan has laid the foundation-stone of a new Roman Catholic Church, dedicated to SS. Peter and Paul, at Ilford. The site of the church is in the High Road, close to Ilford Parish Church. The new building is designed with nave and side aisles, two chapels, and sanctuary. At the north end there will be a choir gallery and priests' sacristy. The portion now being built includes a sanctuary, nave, and choir gallery. The presbytery south of the church will have accommodation for two priests, and it will be capable of enlargement for three priests. The style of architecture is Perpendicular Gothic. The external dressings will be of Portland stone with Kentish rag facings, and stock bricks relieved with red bricks, and a red tiled roof. The internal dressings will be of Bath stone. The work is being carried out by Messrs. Gregar and Son, of Stratford, the architect being Mr. Curtis, of London Wall, E.C.

KIRKCALDY.—At a meeting of the Directors of the Dysart and District Building Company Limited, Messrs. Swanstonehegge, Kirkcaldy, were appointed architects and surveyors to the Company.

LONDON, W.—The Bishop of London last week opened the new central administrative block of the St. Marylebone Workhouse. The present new block was begun in 1896. The old clock and peal of bells which were taken out of the demolished buildings have been remodelled to suit their new position, and have been placed in an octagonal belfry built in English oak. Both clock and bells were found in good preservation, after being in use nearly 100 years. The general dining hall in the new buildings is capable of seating 1000 inmates at meals. It is a lofty, well-lighted apartment, the walls being faced with glazed bricks relieved by a dark dado and coloured bands, and with its open timber roof and panels decorated in stencilled colour it forms a cheerful room. The tables are so constructed that they can be folded so as to form comfortable backs to the seats when the hall is used for entertainments. Adjoining the dining hall is the general kitchen, which is fitted with the latest and best steam and gas apparatus for cooking for as many as 2000 people at one time. The chapel is seated to hold 550 people. Much attention has been given to lighting, warming, and ventilation. The dining hall is heated with steam coils, and all other rooms are fitted with open fires, while the whole building is lighted throughout by electricity, gas also being provided at certain points. The buildings have been erected from the designs of Mr. A. Saxon Snell by Mr. Charles Wall, whose contract for the work amounted to £48,000. The entire cost has been £50,000.

LOWESTOFT.—The opening of a new children's wing of Lowestoft Hospital took place a few days ago. The building has been designed in character with the existing building, and connected thereto by a covered way or corridor paved with tiles. The large ward is arranged for six cots. The floor is laid with polished maple blocks, the walls finished in Parian cement, the dado being painted, and along the

top there are a series of nursery tiles. There is also a smaller ward for two beds of similar construction. Situated between the two wards is a nurses' duty room. The building has been designed and erected by Mr. W. J. Roberts, architect, London Road, Lowestoft.

MAGHERAGALL.—The consecration of the new chancel of the parish church took place a day or two ago. The edifice occupies the site of an older one, and was built in 1830. Although belonging to so unhappy an architectural period, it can boast a well-proportioned tower, and is most picturesquely situated. Mr. G. L. W. Blount, of Waring Street, Belfast, prepared plans for the addition. The general detail of the new building and furniture is early English in feeling. The following firms executed the work:—Messrs. Telford and Telford, of Dublin, in removing organ from gallery to new position; Messrs. Musgrave, heating; Messrs. Ward and Partners, College Street, Belfast, stained glass and tiling; and Mr. George Jones, Great George's Street, wrought-iron work. The contract was carried out by Mr. Walter Law, builder, Moira.

MORRISTON.—Foundation stones of a new Welsh chapel at Morriston have just been laid. The site is on the corner of Horeb Road and Cwmbath Road, and it is being erected by Messrs. Thomas and Jones from designs by Mr. W. W. Williams, architect. The cost will be about £1600.

OUNDE.—In a competition recently held here for the best design for a new town hall, with space for stage, council chamber, retiring rooms, and the usual offices, nine architects competed. The design sent in under the pseudonym of "Nene" was accepted, the author of which is Mr. J. Boothroyd Corby, architect and surveyor, Stamford.

ROTHERHAM.—The foundation stone has been laid of a new Episcopal church at Banklow, Rotherham. The plans for the structure have been prepared by Mr. E. I. Hubbard, and when completed the church will consist of nave, aisles, chancel, organ chamber, vestry, and bell turret. At present contracts for the nave have only been accepted. The church will be constructed of red bricks with terra cotta dressings, and traceried windows. The nave arcades will be built and temporarily closed with screen walls. The structure is designed to seat 412 persons at present. The floor will be laid with wood blocks, and the church warmed with low pressure hot water. The seating, recently removed from Maltby Church, will be adapted and used. The cost is estimated at £1900. Mr. W. H. Trehern, Parkgate, is the contractor.

SHEFFIELD.—New buildings have been added to the John Street Primitive Methodist Chapel, consisting of an infants' schoolroom with gallery, four other classrooms of good size, and two large assembly rooms. The contract for the work of extension was let to Mr. John Morton, of John Street. The architect was Mr. C. J. Innocent.

SOUTHEND.—The handsome statue of Her Majesty presented to Southend by the Deputy Mayor of the borough has just been unveiled. The statue represents the Queen crowned, seated in her chair of State, supporting in her left hand a sceptre, while the right arm is raised and points in the direction of the sea. The expression of the face is homely and pleasing, and a faithful likeness. The general effect is extremely majestic, and the statue being appropriately placed on an eminence facing the pier, makes it still more striking and commanding. The statue, which was carved out of a block of Carrara marble weighing nineteen tons by the sculptor, Mr. J. M. Swynnerton, is approached by two marble steps, and protected by an iron rail, the whole surrounded by tastefully laid out flower beds. Both the pedestal and throne, which are Gothic in design, have been carried out from the designs of the architect, Mr. Edward Goldie.

DEWSBURY IMPROVEMENTS.

SOME LARGE BUILDING SCHEMES.

SOME important building improvements are about to be carried out in Dewsbury. They include the provision of a new market and an extension of the present one, which in all probability will have a glass and iron roof supported on pillars, and perhaps a frontage of shops. The Corporation has already secured the necessary land, which abuts on Crackenedge Lane (fronting the entrance to the Great Northern Railway Station), on New Bridge Street, and on another thoroughfare leading down past the circus and Cloth Hall Mills to Bradford Road. New Bridge Street, which is not new and has no bridge in or near it, has been widened by the Corporation, who purchased much property for the purpose, and who had laid down electrical cables for the lighting of shops and the street lamps, and paved it with Jarrah wood blocks. At present it is devoid of buildings on the north side, only the ruins of tumble-down structures existing, but these will very soon be replaced by business premises. The most important is

A BANK WITH OFFICES,

the whole from plans by Mr. John Lane Fox, architect, Dewsbury, which is to be erected in Northgate and New Bridge Street, with doors at the junction of the two thoroughfares, the frontage to the first being 36ft., and to the second 67ft. The height of the cornices will be 47ft., and from thence rise lofty roofs with windowed gables. The elevation of the first floor will be of grey polished granite, and that above, ashlar from the Holmfirth quarries, relieved with granite bands. The roofs will be covered with green Westmorland slates, and have a ridge of red tiles. The entrance to the bank will be from the corner, where there is a handsome doorway shown in the plans, and leading to a good-sized vestibule; and that to the bank-room proper. A room for the manager is provided *en suite*, with a strong room, and there are convenient offices on the floor above—in all ten in number. In Northgate, adjoining the new bank, there are

SHOP PREMISES

belonging to the Dewsbury Corporation, and these are to be at least new fronted and otherwise improved, and when the construction and alterations are completed that thoroughfare will exhibit a great improvement on its present appearance. But it is in New Bridge Street the greatest change will be exhibited. From the eastern end of the bank already mentioned, Messrs. Holtom and Fox, of Dewsbury, architects, are about to erect buildings—shops, with offices over—which will extend to Foundry Street. Farther on eastward is the hall of the Dewsbury Temperance Society, a structure which has gained in value by the improvements in street lines as carried out by the Corporation, but which is inconvenient in its approach and internal arrangements: Still further to the east is the intended market site, the best frontage being to New Bridge Street, and the next best to Crackenedge Lane. Messrs. John Kirk and Sons, architects, Dewsbury, have prepared

PLANS FOR AN ARCADE,

which is to extend from the Market Place to New Bridge Street; the work being done for Mr. Knowles, of Gomersal. The elevation to the latter thoroughfare will be the most important, both architecturally and in size. The entrance archway is 14ft. wide by 20ft. in height, and is flanked by good shops, with rooms above, altogether three stories and gables. In the Market Place the entrance will be less in size, being only 9ft. or 10ft. in width and 15ft. high. It is flanked with shops. In the arcade proper the buildings on each side are of two stories, those on the ground floor being shops and the rooms above offices, to which there are separate staircases, the whole forming convenient and accessible premises. At the junction of Foundry Street South with New Bridge Street, Mr. Gutteridge is erecting a shop, with workrooms above, from designs by Messrs. D. and W. Thornton, architects, Dewsbury.

Under Discussion.

THE ARCHITECTURAL ASSOCIATION OF IRELAND.

The Architectural Association of Ireland has elected its officers for the session 1898-9. The list is as follows: president, Mr. J. Howard Pentland, R.H.A.; vice-presidents, Mr. Joseph Holloway and Mr. George Sheridan; committee (9), Messrs. H. Allberry, F. Batchelor, T. Coleman, T. E. Hudman, A. I. McGloughlin, L. O'Callaghan, Cecil Orr, R. C. Orpen, and M. J. Tighe; hon. treasurer and registrar, Mr. F. G. Hicks; hon. librarian, Mr. Joseph Geoghegan; hon. secretaries, Mr. R. M. Butler and Mr. A. W. Moore; hon. auditors, Mr. T. F. Slevin and Mr. J. W. Boucher.

MASTER BUILDERS IN SHEFFIELD.

The annual dinner of the Sheffield Master Builders' Association was held at Berry's Restaurant, Moorhead, a few days ago. Mr. J. Longden (president) was in the chair.—Mr. Biggin, in submitting "The Sheffield Master Builders' Association," spoke of the importance of the building trade, mentioning that it employed more men than any other industry, except agriculture. A million pounds were paid weekly in wages, and another million were spent in materials. The Sheffield Master Builders' Association had doubled its membership during the past year. The dispute with the masons was now settled, and in the rules a clause had been inserted constituting a conciliation board, to consist of six employers and six workmen, to arrange any differences which might arise without resorting to strikes.—Mr. A. Forsdike responded.—Mr. Spink proposed "The Yorkshire Federation." He said that the federation was the outcome of the formation of associations. They were forming a universal federation, which would have a very important bearing in regard to strikes. But first they were forming conciliation boards everywhere to prevent strikes.—Mr. J. Dawson replied.

LIVERPOOL ARCHITECTURAL SOCIETY.

The annual meeting of the Liverpool Architectural Society was held a few days ago. Mr. W. E. Willink presided. The annual report of the committee, read by Professor Simpson, hon. secretary, showed that there were 131 members on the roll of the society compared with 121 last year. The meetings numbered twelve for the season, eight being ordinary and four members' meetings. During the year the society celebrated its fiftieth anniversary. The statement of accounts, read by Mr. Dod, showed a balance in hand of £25 and £42 to the credit of the library fund. The report and financial statement having been adopted, the following officers were re-elected:—President, Mr. W. E. Willink; vice-presidents, Messrs. W. Owen and J. Woolfall; hon. secretaries, Prof. Simpson and Mr. W. A. Thornely; hon. treasurer, Mr. James Dod; hon. librarian, Mr. J. W. Blakey. The following were elected to form the committee:—Fellows: Messrs. C. J. Anderson, H. L. Backwith, J. W. Blakey, T. E. Eccles, H. Hartley, W. Owen, and J. Woolfall. Associates: Messrs. F. E. P. Edwards and E. P. Hinde. Subsequently an address was delivered by the president dealing with the work of the past session.

A new organ has been erected by Messrs. Hele and Co., of Plymouth, at Strete Church, Dartmouth.

Enquiry Department.

INSTITUTE EXAMINATIONS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you please inform me of suitable books on the following subjects, required in the Preliminary Examination, R.I.B.A.:—Plane Geometry, Geography of Europe, History of United Kingdom, Elementary Mechanics, Elementary Physics, English Grammar?—Yours faithfully,

STUDENT.

We understand that the Preliminary Examination at the R.I.B.A. is simply intended as a test of general education. We therefore have no special knowledge of the text books suitable to such an examination, general education being beyond our province. With regard to plane geometry, we presume you do not refer to theoretical treatises such as that by Euclid, but to what is known as Practical Plane Geometry. We rather deprecate the use of all such books—which give rule-of-thumb methods without giving the proofs and the reason why—as tending to develop a parrot-like unreasoning knowledge and no real education; unless the proof of each problem is worked out theoretically by the student as he goes on. With reference to the History, we think that "Green's History of the English People" is particularly helpful to the architect, as it concerns itself more with the life of the people, and helps us to understand the conditions under which our old buildings were produced. For the rest, "Longman's Geography," by G. G. Chisholm; "Statics for Beginners," by Greaves (Macmillan); "Practical Physics," by Glazebrook and Stuart (Longmans, Green and Co.), might be of use to you.

A new Methodist school and class-rooms have been erected at Diss.

A new organ in Holy Trinity Church, Scarborough, has just been dedicated.

THERE are few of the present generation who will remember that Mr. Gladstone was at one time a collector of works of Art. His success in this walk of life was not by any means as marked as in others, and when the result of many years' buying was displayed at Christie's in June, 1875, it was notable more for quantity than for quality. It completely filled the auction rooms, and not only were the walls hung with his pictures, but cases on the tables were filled with ceramics, bronzes, metal work, ivories, and glass. Wedgwood, Worcester, and Chelsea china seems to have principally attracted him. Even the owner's fame could not ensure a monetary success. There were 384 lots of what we now term "bric-à-brac," and these fetched only the sum of £4700, or not more than £12 a lot, the highest price being realised by a Louis XV. clock, which sold for £472. The pictures were ninety-four in number. Few of them were important, and most of them had been a good deal restored, and they averaged only some £30 apiece. It may be noted that Mr. Gladstone was an early admirer of Mr. Leader, R.A.; a "Welsh Churchyard" by him sold for £178. But the highest price realised in the sale was for a picture by Mr. Dyce—a lady with a coronet of jasmine, which sold for 400 guineas. Probably the direction in which Mr. Gladstone was most successful was in his Wedgwood purchases, the Greek forms upon which may very well have appealed to the archaeological bent of his tastes.

KEYSTONES.

THE Morecambe District Council has approved plans and details of a sewerage scheme for the district. The cost estimated is £60,000.

A STAINED-GLASS window, executed by J. and W. Guthrie and Andrew Wells, Limited, of London and Glasgow, has been erected in Larne and Inver Parish Church.

THE new Morley Hall and Gymnasium, in George Street, Hanover Square, W., is a fine and well-lighted one, with two side galleries, and is capable of seating 500 people. The gymnasium is below the hall.

THE Established Church is to build a manse at Cupar Fife. At a meeting of the Building Committee held recently a number of plans were submitted, and the design adopted is one of those sent in by Mr. David Storrar, architect.

FIVE BELLS rehung at Holcombe Rogus (Devon) and a sixth bell in a new cage have recently been dedicated.

PLANS for proposed alterations to premises in the Old Market Place, Cleckheaton, have been submitted to the authorities at Leeds.

AN engineering feat of considerable importance is at present in course of accomplishment in the Yukon district, in the construction of the White Pass and Yukon Railway. The making of the White Pass and Yukon Railway will curtail by a number of weeks the present arduous method of reaching Klondike.

THE monument to Mr. Gladstone which it is intended to set up at Athens was, of course, projected long before his death. The site ought to be in the Zappeion Gardens, near the Temple of Zeus, and looking out on the blue gulf and the distant peaks of Ægina. There already stands Falguière's marble memorial of Byron.

WE understand that since they reported

upon the results of their search for a suitable site for another lunatic asylum for the West Riding, the Committee appointed by the West Riding County Council have visited several estates and pushed on vigorously with their work of inquiry. Mr. Wilfrid Tempest has again renewed his offer of Ackworth Grange, and the Committee have also in view the estate of Fixby Hall; Coley Hall, near Lightcliffe; Crow Nest, the property of the Mayor of Brighouse; Storthes Hall, near Kirkburton; and a site near to Penistone.

THE Cock at Sutton is following the way of most of the historic inns of London and the suburbs, and in a few days its place will know it no more. It is perhaps the quaintest feature of Sutton High Street, and it has been familiar to successive generations from the time when stage-coaches rattled their human loads along the old road to Brighton, down to the present time when cyclists whizz by in battalions. But the days of its glory are past. A huge

new building close by has superseded it, and in a short time shops and business premises will occupy the site of the well-known hostelry and its extensive gardens.

THE Caerphilly Urban District Council has applied for power to borrow £36,000, for the drainage of Caerphilly, Llanbradach, Aber, and Senghenydd. Mr. W. O. Harpur, surveyor to the council, has prepared the plans, sections, &c., and at the Local Government Board inquiry recently he stated that the district proposed to be drained under this scheme was about 17,000 acres, and the scheme was in two sections, viz., the Rhymney Valley and the Aber Valley. Future requirements were looked to in the arrangement of the scheme. Both mains would fall into a farm called Gwain-y-Bara, in the hamlet of Van, about a mile from Rudry. This farm had been purchased under a Provisional Order, and the sewage disposal scheme adopted was the intermittent and broad irrigation system.

SHANKS & Co., Tubal Works, Barrhead, near Glasgow.

A NEW Wesleyan Sunday Schoolroom has just been opened at Freckleton.

THE new Orange Hall at Drumbeg was formally opened a few days ago.

THE ceremony of laying the foundation-stone of a new church building took place in Lurgan recently.

A FREE exhibition of pictures was opened recently by Earl Beauchamp, at the Bermondsey Settlement, S.E. The exhibition is to remain open until June 4th.

UNDER the auspices of the Mansfield Corporation, Messrs. Wilson, of Leeds, are holding an exhibition of gas cooking stoves and other gas appliances in the Mansfield Town Hall.

MEMORIAL stones of a new Wesleyan Chapel at Blackwood have been laid within the past few days. The architects of the building are Messrs. Rosser and Roberts, of Abercarn.

A SCHEME is on foot for building a new church at Ravensthorpe, in the diocese of Wakefield. The cost will be upwards of £10,000.

AN elementary school is about to be erected at Askham Richard, near York. Plans have been prepared by Messrs. Penty and Penty, of York.

THE committee intrusted with the erection of the recumbent figure of Dean Vaughan, which is to be placed in Llandaff Cathedral, have issued an appeal for £300, in addition to the £500 already subscribed. When this is provided the work will be placed in the hands of Mr. Goscombe John.

A POLL of the ratepayers of Sheffield has been taken with a view to ascertaining whether they are in favour of the Corporation purchasing the undertaking of the Sheffield Electric Light and Power Company. There voted for the Corporation completing the purchase, 28,130; against, 1965.

THE ceremony of dedicating a new organ for the use of the Liskeard Bible Christians took place in the Bible Christian Chapel. The organ was opened by Mr. W. Fielden, A.T.C.L., in the afternoon, after which there was a public tea, followed by a sacred concert, the choir being assisted by singers and musicians from the town and neighbourhood.

AN American investigator, Professor Rufus B. Richardson, has discovered at Corinth a marble block about 3½ft. long, with an inscription mutilated at both ends. The inscription seems to have been "Synagogue of the Hebrews," in Greek, and the stone in all probability came from the very synagogue in which St. Paul reasoned every Sabbath, and persuaded the Jews and the Greeks.

ONE of the most ancient and interesting of English village churches is the Parish Church of Corhampton, Hants. It is built on an artificial hillock, and the churchyard is perched up on the other side of the road. The site may have been originally one for heathen worship. Some people think that it may be the actual work of St. Wilfred of York. The church is to be restored, and it is much to be hoped that it will not be injured.

COLONEL W. R. SLACKE, R.E., has held an inquiry on behalf of the Local Government Board at the Guildhall, Nottingham, into the application of the City Council for sanction to borrow £51,500 for works of sewerage, £3940 for purposes of public baths, £3000 for the provision of a depot at Bulwell, and £800 for purposes of street improvement.

NOTWITHSTANDING strenuous attempts to preserve the old buildings in Church Row, Hampstead, said to be among the finest examples of Georgian domestic Architecture in England, the work of demolition has already commenced. Blocks of flats are to take their place. The Row had many artistic and literary associations, and was picturesque, but the demand for mansions is superior to such considerations.

FOR the present the reign of Boadicea over Westminster Bridge has come to an end. The plaster cast of the British Warrior Queen in her Roman chariot has disappeared from the neighbourhood of the Clock Tower. On Monday week her head was unscrewed and her body dismembered; the steeds were decapitated and their legs sawn off; and the various portions of the group were carted away on County Council vans.

SUPPLEMENT FOR

SURVEYORS · BUILDERS · SANITARY ENGINEERS ·

JUNE 1ST, 1898.

Builders' Notes.

A CORRESPONDENT at Niagara writes to the Times, as follows:—The second great steel arch bridge which is being built across the gorge at Niagara Falls to take the place of the last of the suspension bridges is to be the largest of its kind in the world. The main arch was completed on April 18. The new bridge is to stand on the site of the upper suspension bridge close to the Falls, and will practically connect the two great free parks at Niagara, the New York State reservation on the one side, and Queen Victoria Niagara Falls Park on the other. The length of the main span is 868ft., and it will be connected to the cliffs by two approaching or flanking spans, the one on the New York State side to be 190ft. long, and the one on the Canadian side to be 210ft. long, making a total length of 1268ft., which is the length of the bridge it is to supplant. The arch is to be a single deck structure, and its floor will have a width of about 49ft. Of this about 23ft. in the centre will be given up to a double track for an electric road service across the gorge. On each side of the tracks there will be carriage-ways 8ft. wide, and beyond them still there will be footpaths for pedestrians slightly elevated above the roadways. The arch will not be of such heavy construction as the arch built two miles down stream last year for the Grand Trunk Railway, but it will be a far more graceful structure. In all about 4,000,000lb. of steel will be used in its construction.

THE work that remains to be done will progress rapidly, and it is expected that the structure will be finished by early summer. The arch will be the fourth bridge erected on this site, the first having been thrown open to the public in 1869. It was a wooden bridge, 10ft. wide, and in 1887-88 it was rebuilt in steel and given a width of 17ft. This bridge was destroyed by a hurricane in January, 1889. It was at once rebuilt, and it is this bridge that is now to give way to the new one. The difficulties that have to be surmounted in such a work as this are, of course, enormous. Only skilled labour can be used. All that is done must be done quickly, for in such works time is money. The men employed must have nerve and clear heads, and be able to hurry about on the timbers and steel nearly 200ft. above the water without faltering or making mistakes. In an undertaking of this nature the slightest error might be productive of great disaster. In making the sections every

measurement must be accurate to a hair's breadth. But this is not all in the present instance, for, when the arch shall have been completed, the suspension bridge that it supercedes is to be transferred piece by piece seven miles down the river to the site of the old suspension bridge connecting Lewiston, N.Y., and Queenston, Ont., and there rebuilt to take the place of the bridge destroyed by a wind storm in 1864. The cables of this old bridge have hung suspended across the gorge ever since, swinging to and fro in the wind, and occasionally crossed by some venturesome person. The rebuilding of the suspension bridge will of itself be a notable engineering feat, and one certain to attract much attention. The chief engineer in charge of the whole work is Mr. L. L. Buck.

THE building of the Jubilee Bridge over the Wye near Hereford Castle Green is now in progress. An excavation has been made in the pathway near the river hedge 11ft. deep and 14ft. by 5ft. wide for the first shore abutment. This hole is filled with concrete. A similar abutment will be made also on the opposite shore. On either hand of these abutments, as entrances to the walking way, will be a pediment 12ft. high of terra-cotta, displaying panels of the royal coat of arms, and surmounted by ornamental lamps. The distance across the river between the abutments will be 176ft. As soon as the weather permits the river to get low enough, perhaps in July, two central piers will be built in the river, each of them about 33ft. distant from its nearest shore abutments. The one nearest the garden goes down to the solid rock, and the other will be taken to a solid gravel foundation. Upwards of 200 concrete blocks, each weighing about $\frac{3}{4}$ cwt., have been hauled down to the garden ready to form the facing of the central piers. On the inner side of these blocks is a groove, by means of which concrete poured into the centre of the piers will key them together. The piers rise from a foundation of 10ft. diameter to a width of 6ft. above the water, tapering to 6ft. 4in. There will be a span of 110ft. between the piers. The boarded walking way, which is to be about 7ft. wide, will be 20ft. above the summer level of the river, and 6ft. to 7ft. above highest flood water, a foot higher in the centre than at the sides. It will be two steps higher than the present garden path, and several steps higher than the opposite bank. The little elm tree, which is but a sucker, will be removed. In addition to the ornamental lamp pediments at the entrance to the bridge, there will be ornamental parapets rising above the bridge

from the central piers. The metal work, which is being supplied by Messrs. Findlay and Co., Glasgow, at a cost of £599, comprises 17 tons 6cwt. of steel, such as chains, links, girders, main pillars, &c., and 1 ton 11cwt. of cast iron. It is estimated that the total cost of the bridge will be £1200.

A RUSSIAN correspondent in the Times gives the following particulars about the present state of the Trans-Siberian Railway:—"The railway is at the present moment in a completed state to as far as the 265th kilometre beyond Tcheliabinsk, and there remains only 354 more kilometres for it to reach the terminus point of the Central Siberian section that is to say, the town of Irkutsk. On the Western Siberian section all the works are actually completed. The length of this section is 1342 kilometres, and it has been open to traffic since October, 1896. The first section of the Central Siberian portion, from the Obi to Krasnoiarsk, a distance of 711 kilometres, is almost completed, and the necessary workshops are being built in that town. On the next section, from Krasnoiarsk to the left bank of the Angara, which is 1004 kilometres in length, the road is finished in a rough fashion for 342 kilometres and travellers are even conveyed by it. Further on the rails are also laid down for a length of 308 kilometres to as far as the station of Toulouna, but the ballast will not be completed before next year. Between Toulouna and the river Angara, the embankments, all the bridges of wood, and almost all the buildings are constructed, and, in consequence, it is hoped that about the end of August the railway will be running as far as Irkutsk.

THE dispute between the Newport Master Builders' Association and the Carpenters' Societies, which resulted in the men being locked out before Easter, shows no signs of being settled. The masters during the last few days have abandoned the lock-out and have thrown their shops open. The men, however, desire a settlement of the overtime question, over which the dispute originated, but up to the present the masters have declined to consider the matter, and have attempted to fill their shops. The attempt has not met with success up to the present. In some few cases new hands have been obtained, but the men's officials have interviewed the new comers, and have succeeded in inducing more than half of the number engaged to leave work. The local societies are receiving support from other branches.

THE BUILDERS' VADE-MECUM.

MESSRS. YOUNG AND MARTEN'S
CATALOGUE.

A WORK that has taken some five years in its compilation, and absorbed £8000 in preparation, has certainly established a record, in catalogues, that will be "bad to beat." The two handsome volumes issued by Messrs. Young and Marten, of Stratford, E., well bound in cloth, with stiff boards, beautifully printed on stout paper, and containing nearly a thousand pages of engravings, including fifty lithographed in colours, of their vast stock of building materials and sundries, copiously indexed, fully priced and dimensioned, may well be termed a "Builders' Vademecum." Therein will be found in profusion, designs of marble, serpentine, slate, iron, and fancy wood chimneypieces, overmantels and tile grates, with stoves, ranges, and kitcheners in hundreds of varieties, suitable for any class of property, from the workman's cottage to the palatial hotel; and even the wants of the dashing yachtsman, or the more luxurious houseboat navigator, have not been forgotten. Fenders, curbs, dogs, brasses, designs in colour of tessellated tile, and mosaic hearths with all the various sundries of smith's work, as boilers, taps, plate racks, doors, hot-water tubes, &c., are comprised in the stove section. Baths and fittings in zinc, iron, copper, porcelain, and fireclay; lavatories and latrines, sanitary and other w.c.'s and fittings; ventilators, paperhangings, drain pipes, public-house fittings, timber, prepared joinery, wrought and cast-iron railings, columns, stable fittings, builders' machinery, cathedral lights, plumbers', gasfitters', carpenters', smiths', bricklayers', and painters' tools and sundries; to mention only a few of the prominent sections, indicate the wide range of this most comprehensive catalogue, from which nothing within the whole field of building operations seems omitted, and will also give some idea of the quantity of stock held by the firm, ready for immediate delivery, in their depôts at Stratford, Walthamstow, and Leytonstone.

The advantages offered to the architect, builder, and sanitary engineer, in thus gathering everything requisite to the construction of a modern building into one establishment, in the economy of time and expense, coupled with facility of inspection and comparison of various specialities, is too obvious to need comment. That the quality of the goods supplied by the firm, and their methods of business, have given satisfaction to their customers is very convincingly attested in the growth of the floor space of their warehouses, which in 1872 comprised an area of 1120 superficial feet, increased to, in 1897, 266,193ft. A truly remarkable progress, this—an increase of upwards of two hundred times the original area in a quarter of a century. In running through the catalogue we have noticed many

ingenious and novel specialities manufactured or stocked by the firm, a few of which, in the interests of our readers, we propose drawing especial attention to. In the "Russell Patent Titbit" grate, a remarkably ingenious arrangement for keeping a plate of food, &c., warm has been adopted, that will prove of great service in sick-room or nursery, or even the breakfast parlour. The grate is of the ordinary open fire pattern, with the usual canopy above. This, however, is hinged, and when let down discloses a good-sized oven or receptacle, passing over the fire in such way as to be heated, without interfering with the draught. The oven is removable, to allow of the chimney being swept. The "Herald Kitchen," by the same inventor, carries the idea of utilising occasional waste space still further. Here a collapsible oven is contrived over the hot plate of a kitchen range, a sheet-iron side plate lies folded at the back of the range, and a door hinged in front is folded on the end. These can quickly be brought into position at right angles with each other, thus forming an enclosed space equal in size to the oven beneath, in which bread may be baked, meat roasted, or water boiled, without using extra fuel, and at the same time to the advantage of the oven beneath, as there is no loss of heat by radiation. The range is also fitted with patent lifting bottom grate, cinder sifter, and usual accessories, and is altogether an inexpensive and useful kitchen fitment for a middle-class house.

In the "Delight" portable and self-setting range the firm have undertaken to produce a cheap, reliable, and strong range, suitable for an artisan's kitchen, and that they have been successful seems beyond doubt, in the light of their statement, that they have supplied 100,000 without a complaint. The "Bramstone" combination bath and lavatory provides a convenient and ornamental adjunct to the reclining bath, in the shape of an ivory-ware porcelain basin superimposed at the foot of the bath, thus occupying no extra floor space, nor detracting from the comfort of the bather.

Separate waste pipes are provided, so that the water from the lavatory does not pass into the bath.

We note a very cheap and well-designed closet of the washdown type, made in stone-ware, called the "Straight-back." This is made in two pieces, with a deep-socketted trap, capable of adjustment at any angle with the pan to suit position of soil pipe. The water seal is a deep one, and there is a minimum of fouling surface. The curves of pan and trap are conducive to efficient discharge of the contents. The only thing wanting to make it perfect is an anti-siphon connection on the drain side of trap.

A very useful time and labour-saving tool for builders, whether in a large or small way of business, is the "Jones' Patent Pipe-Cutter," illustrated herewith. A number of hardened steel discs are pivoted between the links of a square chain, attached to a hinge-forked handle, and capable of adjustment to suit any size or shaped pipe, which is rapidly cut through by a few swings of the handle; it may be used in very confined spaces, and should prove very serviceable in cutting iron drain, down, or hot-water pipes; even in a jobbing shop it will soon repay its cost, in the avoidance of breakages. Among the smaller goods worthy of notice is the "grip" patent axle pulley. These pulleys have no face plates, the frame or casting, being reeded at the sides, simply require three suitable centre bit holes, bored in the pulley stile, when the pulley may be driven in, with a mallet flush with the face, a touch of paint or glue securing them. They seem strong and neat in appearance, and should save some 50 per cent. in labour. A very strong and efficient Turnbuckle for cupboards is shown in "Speciality No. 9;" the spindle is threaded into a sleeve on the buckle, secured to the knob with a set screw, and the latter works in a solid brass, sleeve rose, fixed to the face of the door, thus ensuring smooth action. One of the best designed hand mortising machines we have seen is the Centre Motion Mortiser, shown on page 660. In this the chisel carrier is of rectangular section of considerable length, and works in dovetail grooves, with adjustable cheeks, is raised and lowered by screw and handle at the top of column; the lever passes through a slot in the carrier directly over the chisel, thus gaining much additional power, and avoiding the cross strains set up by the cranked lever type, or the multiplicity of parts of the toggle movement, there are several accessory attachments, including a venetian blind punch and die, a very compact and evidently strongly made boring apparatus, with augers, twist bits, and drills, also a tenoning tool, the utility of which we rather doubt. The machine is listed at £12 7s. 6d., without the extra tools and should prove a good investment.

The patent "SteeLead" stair-tread is an ingenious combination of lead with steel, in which the grip of the softer metal is supplemented by the wearing properties of the harder. A network of stout, woven steel wire, is embedded by means of hydraulic pressure into a thick sheet of lead which is rendered much denser and harder in the process. It is supplied in any length and of various widths, from

2in. to 9in., to suit either nosings or treads, and is warranted "unslippable." It may be easily fixed either with nails or screws, and there is no creeping or wrinkling action, so detrimental to the durability of ordinary lead covering.

Messrs. Young and Marten are the sole agents for the "Eclipse" hot-water boiler, manufactured in Canada, a very compact and powerful apparatus, requiring no brick-setting or skilled labour to fix. The heating area is very large. Practically the whole surface of the boiler, with the exception of the door, is waterway, and the fire is taken in an unbroken sheet, by a sinuous course, some 11ft. of travel, from fire box to outlet, and thereby utilising to the utmost its heating capacity with consequent economy in fuel. The interior is very accessible for cleaning, and any worn parts are easily replaced. The whole thing is covered with asbestos packing, and should prove an efficient and rapid heater. In conclusion, we trust that the firm will reap the due reward of their enterprise in providing the trade with so serviceable and handsome an encyclopædia of building requirements.

At the Manchester County Court recently Mr. Yates, Q.C., the stipendiary magistrate, gave his decision with respect to an application of the Manchester Corporation for a

THE SANITARY INSTITUTE.

EXAMINATION SUCCESSES.

At an examination in practical sanitary science, held in London, on May 6th and 7th, 1898, twelve candidates presented themselves. The following five candidates were granted certificates in practical sanitary science:

Alfred Seabold Eli Ackermann, 53, Victoria Street, S.W.; Henry Bates, 100, Bunhill Row, E.C.; William Cumming Henley, Duke Street, Dartmouth; John Hipkin, The Manor House, Bedhampton, Havant, Hants.; Gilbert Thomas Inglis Oliver, The Archers, Woodchester Road, Stroud, Gloucester.

At an Examination for Inspectors of Nuisances, held in London on the same dates, 109 candidates presented themselves. The following 64 candidates were certified, as regards their sanitary knowledge, competent to discharge the duties of inspectors of nuisances:—

David Bagshaw, 38, Beatrice Street, Plais-tow, E.; William Barker, 16, Butt Road, Colchester; William John Bates, 101, Sussex Road, Holloway, N.; George Best, 16, Alfred Hill, Kingsdown, Bristol; Herbert Edward

mead Street, Fulham, S.W.; Charles Matthew Longden, 2, Warwick Place, W.C.; Percival William Luke, 12, Percy Road, Queen's Road, Gosport; Miss Annie Malone, 4, Brunswick Square, W.C.; Sidney Septimus Markham, 67, Springdale Road, Stoke Newington, N.; Miss Edith Louisa Maynard, Wolsey House, Harrow; Samuel James Maynard, 19, Lisson Residences, Lisson Street, N.W.; Frank Whiddon Melhuish, M.R.C.V.S., Health Department, Sydney, Australia; Miss Christabel Mennell, The Red House, Croydon; George Mitchell, Derby Union, Utttoxeter Road, Derby; Miss Catherine Alice Nevile, 3, Blythwood Villas, Stroud Green, N.; Ernest Archibald Norman, 65, St. Andrew's Road, Southampton; John Henry Pearson, 52, Needham Road, Liverpool; Miss Maud Elizabeth Piggott, 148, Castle Hill, Reading; Miss Kate A. Platt, 3, Great James Street, Bedford Row, W.C.; William Charles Portman, 46, Bolina Road, Cliftonville, Bermondsey, S.E.; Alfred George Potter, 10, Frant Road, Thornton Heath, Croydon; Joseph John Pratt, Hillingdon, near Uxbridge; Arthur Stephen Quelch, 136, Walton Street, Oxford; John Howell Reynolds, 6, Bridge Road, Wellington, Salop; Alexander Muir Robertson, 1, Ruby Place, Charlton Kings, Cheltenham; Edward William Sandford, 44, Exmouth Road, Gray's, Essex; Ernest Edgar Scott, 31, Newbury Road, Bromley, Kent; Miss Ethel Stewart, 3, Princess Road, Regent's Park Road, N.W.; Herbert Tavinor, 16, Denny Road, Lower Edmonton; Charles Russell Thomas, 142b, High Street, Lewisham, S.E.; Henry John Toogood, Town Hall, Spa Road, Bermondsey, S.E.; Henry Stephen Toogood, 56, Buxton Road, Thornton Heath Croydon; Mrs. Emily Caroline Townshend, 40, York Street Chambers, Bryanston Square, W.; Thomas Tribe, Church Road, Farncombe, Godalming; George Simpson Walker, 38, Nottingham Place, W.; George Robert Weeks, 45, Tasman Road, Clapham Road, S.W.; John Wells, 40, Jessica Road, Wandsworth Common, West Side, S.W.; James West, 142, Lillie Road, Fulham, S.W.; Thomas William Williams, 32, Barking Road, E.; Charles Northesk Wilson, 5, Grittleton Road, Elgin Avenue, Maida Vale, W.; Miss Teresa Frances Wilson, 20, Motcomb Street, Belgrave Square, W.; Isaac Worrow, 156, High Street, Shadwell, E.

further extension of time to enable them to carry out the order made by the Court in September, 1896, for the completion of the sewage works. This application, Mr. Yates said, was made by the Corporation of Manchester, who asked for an extension of time wherein to obey the order of the Court made, with the consent of the Corporation, on September 16, 1896, and extended by successive orders until May 11, 1898. The decision of the Court ought to depend mainly upon whether the Corporation had really decided upon any effective scheme for dealing with the sewage of the city. He did not mean whether the scheme put forward was the best or not—that was not a question for the Court, but for the Corporation—but whether the plan suggested was a final or only a tentative one. The bare facts were that the sewage of an ever-increasing population, now amounting to 600,000, was being turned into an almost stationary body of water unpurified; that that had been going on to a greater or less degree for at least five years; and that the Corporation were no nearer a final settlement of the question than they were in 1893. If the Court were still to prolong that period it would be stultifying itself and the order made by it, by consent of the parties, in 1896. They therefore unanimously and unhesitatingly refused the application, with costs.

Brown, 80, Grenard Road, Peckham; Tom Leonard Burrell, 24, Lordship Lane, Wood Green, N.; Harry Callow, Ferndale, 23, Arodene Road, Brixton Hill, S.W.; Miss Edith Helena Cordner, Torbay Mount, Torquay; George Edward James Davies, 4, Lupus Street, St. George's Square, S.W.; Samuel Nicholas Davy, The Coroner's Court, Cambridge Street, St. Pancras, N.W.; John Edward Dowell, 36, Havelock Road, West Kensington Park, W.; Henry Llewellyn Dunkin, 55, Brand Street, Greenwich; Edward Herbert Faragher, 7, Myrtle Street, Douglas, Isle of Man; Edwin Few, 17, Highbury Park, N.; Edwin Dowsing Gedge, 45, Arlies Road, Lavender Hill, S.W.; William Herbert Stevens Gowen, Roundstone Street, Trowbridge, Wilts; William James Griggs, 16, Alma Square, St. John's Wood, N.W.; Frank Archer Gwillim, Cwm Dulas, Pontinas, Hereford; Herbert Robert Hardy, 23, Pitt Street, Norwich; William Hawke, 11, Truro Road, St. Austell; Thomas William Hull, 1, Southmoor Road, Oxford; Howard Light Hyde, Ruby Villa, Pultney Road, Enfield Wash; Isaac Richard Jones, 18, Lucretia Road, Kennington, S.E.; William David Jones, 6, Dufours Place, Golden Square, W.; William Phillip Jones, U.D. Council Office, Cymmer, R.S.O.; Arthur Edward Lang, 30, Tottenham Street, Great Yarmouth; Arthur James Lester, 5, Perry-

SINCE the Cattewater scheme faded out of view, little has been thought of the subject of harbour development in Plymouth. It is, however, not wholly lost sight of. The Great Western Railway Company is proceeding with the execution of the works for the improvement of the entrance to the inner basin at Millbay Docks. Some delay was caused by the discovery that it was difficult to obtain a firm foundation at the exact spot fixed upon for the new works, but a very little alteration in the site overcame this trouble, and the contractors have now commenced operations.

The report of Sir Douglas Fox, who made an examination of the work at Hastings Harbour on March 8th, has just been issued. The eminent engineer first recites the character of his examination, and goes on to say that he considers the site well selected, and to deal with the work already carried out. He is of opinion that the foundations are of insufficient depth to be left unprotected on the seaward side. Commenting upon this, Mr. A. E. Carey, the engineer-in-chief, says that in his judgment the weight on the foundations is perfectly safe and proper. The local defects discovered, he adds, were not serious, and the contractors were responsible for their repair. Sir Douglas Fox's report proceeds to refer to the danger of scour, and suggests modifications as regards the foundations of the parapet. Other suggestions advised an improved method of continuing the arm, and an increase in the thickness of the parapet. Sir Douglas was of opinion that the revised estimate of £226,532 would cover the cost of the works. Mr. Carey thinks Sir Douglas Fox's schemes for the prevention of scour and with regard to the thickness of the parapet are impracticable, and that the design of the breakwater has been justified by the results.

PRACTICAL CARPENTRY AND JOINERY.*

BY GEO. ELLIS.

(Continued from page xlv.)

VIII.—DOOR FRAMES & FINISHINGS.

THE frames in which doors are hung are termed solid frames, or jamb-linings, according to the position they occupy; external doors being hung in substantial frames, of nearly square section, with rebate, and mouldings worked out of the solid stuff; internal ditto, in comparatively thin pieces of framework, built up in several pieces, and much wider than thick as they have to line, the entire sectional surface of the wall finishing flush with the plaster on each face. Solid frames are sometimes employed for interior doors, where great strength is required, as in the swing door, illustrated in the previous article; but generally the jamb lining is employed, one edge being utilised as a frame for the door, the other recessed in a similar manner to match.

Figs. 113-114 illustrate an ordinary solid frame for a small doorway out of $4\frac{1}{2}$ in. square stuff, the upright members are termed posts or "jambs," and the horizontal a "head," this is frequently made to do duty for a lintel, the core of the discharging arch being built directly upon it, as illustrated; whether used for this purpose or not, the head should run over the jambs about 3 in., and may be built into the wall as a fixing, this makes much better work than framing the head between the jambs, as any weight that may come upon the head will then be received by the squarely abutting shoulders of the post on each side of the tenon. These frames are set behind a $4\frac{1}{2}$ in. reveal in the wall, in a $4\frac{1}{2}$ in. set back,

the portion not covered by the frame being lined with a thin casing tongued into the frame on one edge and fixed to wood plugs driven into joints in the brickwork at intervals of about 2 ft., the ground fixed to the front edge is wrought and moulded, and acts also as an architrave.

The isometric sketch (Fig. 115) shows the method adopted for fixing the bottom ends of the jambs into a stone sill; when a wood sill is used the jamb is tenoned and wedged as in the head. A very good method of fixing these frames, especially in stone walls, where it is not so convenient to build the horns of frames in, is shown at the left of Fig. 113; wrought iron straps are bedded in a joint of the wall on each side of the frame, one end is turned up at right angles for about 2 in. and has a hole punched in, which enables it to be fixed to the post with a clout nail or screw, the courses are then proceeded with; other ties being inserted where necessary, thus forming a very secure fixing. The ties should, of course, be painted, as should also all parts of the frame, and linings built into, or contiguous to the walls.

It is advisable not to let the woodwork actually touch the walls—an air space of about 1 in. will prevent dry rot, and the brickwork should be kept clear of the head with a couple of laths. One half of the elevation shows the plaster casings, &c., removed to make clear the method of fixing.

Fig. 116 is a large solid frame with side and fanlights, suitable for a dwelling-house entrance; this class of frame is constructed in a similar manner to the last, so far as the outer frame is concerned, the members of which bear the same names; two additional members are here introduced—the transom, A, and two mullions. Some difference of opinion exists amongst joiners as to which is the better way of framing the internal parts, many contending that the transom should be continuous, and so act as a tie to the frame to prevent racking; the present writer holds to

the contrary opinion, that there is little or no strain in a horizontal direction, but much in the vertical, due to the weight and motion of the doors, therefore he advises that the mullions should be continuous, and the transom cut and framed between them, a joint for the purpose that will withstand any ordinary strain, is shown in the enlarged section (Fig. 117). The tenon on each piece of the transom is cut long enough to go through the solid part of the mullion; the tenons are then haunched back in dovetail pairs, as shown. The mortise in the mullion above the transom is made sufficiently long, to enable the wider portions of the tenons to slide past each other, and, when in place, they are glued. A pair of folding wedges fill the mortise and dovetail the transom together; these wedges are hidden by the fanlights. The joint can also be made with two stump tenons and a handrail bolt, but it is not so good as the above, as the nut sometimes releases itself when subjected to vibration.

Fig. 118 shows the top part of a segment-headed solid frame. These are constructed in practically the same manner as "square heads;" the head is cut out of the solid, the back following the soffit curve to the springing, where it is taken off parallel to the springing line (the "springing" is the point where the curve intersects the vertical side of the opening, and the springing line is a straight line joining the two points). In taking the height of a curved opening, the workman always measures from the sill to the springing, and then adds the rise in the centre; this affords him the three necessary points to describe the curve (see article on "Centering"). An enlarged detail of the joint between head and jamb is shown in Fig. 119. When the frame exceeds $4\frac{1}{2}$ in., double tenons should be employed, as shown in the details, Figs. 120-121, which are the end of jamb and head respectively. The semi-headed frame (Figs. 122-123) is constructed somewhat differently from those hitherto dealt with. The two jambs and the transom are worked in the solid, but the head

is built up of several pieces, arranged in two layers, glued and screwed together, the butt joints in each layer made to fall on the centre of the piece behind it. In the illustration the outside ring is made up of three pieces, the inside of two. The springing joints are square, and made with a hammer-head key. It makes much the stronger frame to keep the transom a few inches below the springing, with a double tenon arranged on each side of the key. When the necessities of the design prevent this, the joint of the jamb with the head should be in the middle of the depth of the transom, a single tenon on the latter running through, and the ends of the head and jamb forked over it; a long handrail screw should then pass through the lot.

(To be continued.)

THE Rural District Council of Basford has applied to the Local Government Board for sanction to borrow £2300 for purposes of sewerage and sewage disposal for the parish of Cossall. Mr. H. Walker (engineer of Works) has prepared the plans for the scheme.

THE Pontefract Town Council recently sent a deputation to Exeter to inspect the septic system of sewage treatment, with the result that the Council has decided to adopt the system. The existing sewage works will be used, and all that will be needed will be the acquisition of septic tanks.

A MEETING has been held in the Queen's Hall of the Three Nuns Hotel, Aldgate, E., "to urge the necessity for more air ventilation on the Underground Railway system. A resolution was adopted urging the local vestries to abandon their opposition to the proposed ventilators in the interest of the health of the travelling community.

IPSWICH.—For the erection of a central fire station, for the Corporation. Mr. E. Buckham, Borough Surveyor, Town Hall, Ipswich:—

Girling ... £4,263 | Roper ... £4,220
Grimwood and Sons ... 4,263 | Thos. Parkington & Sons £3,850
* Accepted. [All of Ipswich.]

LANCASTER.—For rebuilding the Liverpool Bank, Limited. Mr. J. F. Curwen, architect, 26, Highgate, Kendal:—

J. Hatch and Son, Lancaster ... £3,996

LONDON.—For erecting two villa residences at Blackheath, for Mr. Sherley Price, C.E. Mr. T. Norman Dinwiddie, architect, Greenwich, and 5, Whitehall:—

H. L. Holloway ... £5,894 | Kennard ... £5,542
Jerrard ... 5,775 | * Accepted subject to revision.

LONDON.—For reinstating, after fire, the Salvation Army Shelter, Bermondsey. Messrs. Barnes-Williams, Ford, and Griffin, architects:—

Pritchard and Ren- ... Falkner and Sons ... £2,619 0
wick ... £3,430 0 | T. Morgan ... 2,420 10
F. J. Coxhead ... 2,997 0 | A. B. Chirgwin ... 2,138 0

LONDON.—For clearing site and erecting a new factory, Bow, E. Mr. Spencer W. Grant, architect, 63, Finsbury-pavement, E.C. Quantities by Mr. C. W. Brooks:—

Holloway Bros. ... £4,495 | Minter ... £4,230
Neil ... 4,392 | Porter ... 4,121
Spencer ... 4,375

LONDON.—Accepted for the erection of dressing-rooms, lavatories, &c., at "The Elms," Coppermill-lane, Waltham-stow, for the East London Lands and Recreation Company. Mr. F. Towle, architect, Walthamstow:—

W. Lawrence, Waltham Abbey ... £650

LONDON.—For alterations, dilapidations, and fittings at the "Prince Arthur" public-house, Turner-road, Bow, E., for Mr. G. Sherwin. Mr. Fred. A. Ashton, architect, 177, Romford-road, Stratford, E.:—

Alterations, &c. Fittings. Total.
H. Wall and Co. ... £285 | ... £1,680
W. J. Maddison ... 839 | ... 1,608
A. E. Symes ... 920 | ... 1,660
J. and H. Cocks ... 860 | ... 1,597

LONDON.—For new shop-front and fittings to No. 37, Upper-street, Islington, for Mr. J. A. Haslop. Mr. Edmund J. Harrison, architect, 38, Bow-lane, Cheapside, E.C.:—

Lyons and Smith ... £270 0 | Thos. Sobey, Lamb's
Conduit-street ... 722 10 | * Accepted (amended tender).
Thos. Over ... 677 0

LONDON.—For the erection of shops and flats at Ardville-road, Brixton. Mr. E. C. Homer, architect, 35, Bucklersbury, E.C. Quantities by Mr. G. Silvester:—

Courtney and Fair- ... Holliday and Green-
bairn ... £7,677 | wood ... £7,177
Staines and Son ... 7,350 | Godson & Sons (omit-
ting stone cornice) 6,590
Hollingsworth ... 7,282 | * Accepted.

LONDON.—Accepted for building fireproof depository at Victoria Station, Pimlico, for Mr. Charles W. Hudson. Messrs. W. S. Cross and Kedwick, architects, 18, Outer Temple, Strand:—

H. B. Gammon ... £5,685

LONDON.—For completing Clifton-buildings, Brixton, for Mr. A. J. Sanderson. Mr. E. C. Homer, architect, 35, Bucklersbury, E.C.:—

Brown ... £6,666 | Courtney & Fairbairn £5,655
Minter ... 5,750 | * Accepted.

LONDON.—Accepted for additions to the receiving work-house, Bear-yard, Lincoln's Inn-fields, for the Guardians of the Strand Union. Messrs. W. S. Cross and Kedwick, architects, 18, Outer Temple, Strand:—

T. G. Sharphington, Nunhead ... £3,992

LONDON.—For alterations to premises in High-road, Lewisham, for Messrs. James Willing and Co., Limited. Messrs. W. S. Cross and Kedwick, architects, 18, Outer Temple, Strand:—

T. G. Sharphington ... £297 | Love and Co., Exeter-
J. Jarvis and Sons ... 756 | street (accepted) £640

LONDON.—For repairs, &c., at Fishmongers' and Poulterers' Almshouses, Wood Green, N. Mr. H. Dyball, architect, 35, Bucklersbury, E.C.:—

Irwin ... £607 | Willson ... £304
Webb and Sons ... 415 | Whitbread ... 285
J. Mills ... 370 | Willmott ... 240

LONDON.—For the erection of cottages, offices, caretaker's rooms, &c., at Neate-street, Camberwell, S.E., for Mr. E. G. Quinn. Mr. Arthur Garnar, architect, 66, Oakhurst-grove, East Dulwich, S.E.:—

Geo. Parker ... £1,700 | R. and E. Evans ... £1,598
Canning and Mullins ... 1,640 | Lawrence and Co. * 1,560
* Accepted.

MOTHERWELL (N.B.).—Accepted for the execution of sewerage works, for the Commissioners. Mr. Jas. M. Callum, engineer, Town Hall, Motherwell:—

Patrick McLaggart, Motherwell ... £1,394 19 9

NEWPORT (Mon.).—For the rebuilding of premises Nos. 121 and 122, Commercial-street, Newport, Mon., for Mr. Joseph Watkins. Messrs. Morgan and Hodge, architects and surveyors, Newport and Cardiff:—

J. Look ... £2,320 | D. Paritt ... £2,100
A. Hazell ... 2,315 | W. A. Linton ... 2,108
F. Westacott ... 2,315 | T. G. Diamond ... 2,160
J. Linton ... 2,300 | D. J. Davies ... 2,147
J. H. Reed ... 2,282 | J. Moore ... 2,124
Lawson and Co. ... 2,279 | G. F. Davies ... 2,095
V. C. Collier ... 2,250 | J. Davies * 2,045
J. Richards ... 2,200 | * Accepted.

NEWPORT (Mon.).—For the rebuilding of premises Nos. 29 and 30, Commercial-street, Newport, for Mrs. Coleman. Messrs. Morgan and Hodge, architects and surveyors, Newport and Cardiff:—

John Linton ... £2,395 | C. H. Reed ... £2,290
William Moore ... 2,370 | W. A. Linton ... 2,157
G. F. Davies ... 2,330 | David Jones ... 2,095
T. G. Diamond ... 2,295 | T. Westacott * 2,093
John Moore ... 2,249 | * Accepted.

SWINDON.—For the erection of a malt-house, Belmont Brewery, Swindon, for Messrs. Godwin Bros. Messrs. William Drew and Sons, architects, Swindon:—

F. J. Liddington ... £2,036 0 0 | J. Williams ... £493 0 0
W. A. Moulding ... 556 17 6 | J. Hatherley ... 497 0 0
Flewellling & Huck- ... A. J. Colborne,
son ... 555 0 0 | Swindon * 125 10 0
* Accepted.

TONBRIDGE.—For two shops and dwelling houses, Woodspring-road, for Mrs. Baldwin. Mr. Hy. Elwrig, architect:—

G. E. Eldridge ... £750

WHITSTABLE.—For the erection of an Early English gateway at Tankerton Castle, Whitstable, for Mr. T. E. Adams. Mr. A. A. Kemp, architect, Whitstable:—

Wood Bros. ... £210 | Amos T. Foad * 2500
T. Porter ... 770 | * Accepted.

WOLVERHAMPTON.—For the erection of new bottling stores, St. Peter's-square, for Mr. George Palmer. Mr. J. Mason, architect, 86, Darlington-street, Wolverhampton:—

T. and S. Ham ... £1,517 | B. Guest (accepted) £1,478
H. Gough ... 1,485

WESTWOOD (Notts.).—For the erection of a church, near Codnor Park, for the Building Committee. Mr. P. H. Currey, architect, Market-place, Derby. Quantities by the architect:—

T. Gill and Sons ... Estimate A. Estimate B.
Fisher Bros. ... £3,380 0 ... £2,405 0
H. Green and Sons ... 3,358 0 ... 2,389 0
H. J. Robinson ... 3,017 0 ... 2,125 0
W. Salt ... 2,808 0 ... 1,844 0
F. Lee, Alfreton * 2,512 15 ... 1,831 0
Estimate A for complete church.
Estimate B for church with tower omitted.
* Accepted.

WEMBLEY, MIDDLESEX.

A number of IMPORTANT FREEHOLD BUILDING SITES, comprising portions of the highly favoured Building Estate known as "HARROWDENE," about three minutes' walk from Sudbury Station, on the L. and N.W.R., and about one mile from Wembley Park Station, on the Metropolitan and District Railway. The plots all occupy capital positions on the rising ground to the west of the first-mentioned railway, and possess GOOD FRONTS TO THE HARROW-ROAD, the Harrowdene-road, and Crawford-avenue, with depths varying from 200 to 300ft. The Estate is laid out with 50ft. roads, planted with trees, and provided with means of lighting; house connections are laid; gas and water mains are put in throughout; and the carriage-ways have been taken over by the Local Authorities. The best of the sites are eminently suitable for the Erection of Residences ranging from £60 to £100 per annum, whilst others are intended for Villas with rentals of from £35 to £40 per annum.

MESSRS. WALTON and LEE will OFFER the above for SALE by AUCTION, at the Public Offices, Wembley, on THURSDAY, JUNE 23rd, 1898, at SEVEN o'clock p.m. precisely.

Particulars may be obtained of Messrs. FLAGGATE and Co., Solicitors, Craig's Court, Charing Cross, S.W.; or of the AUCTIONEERS, at their Offices, 10, Mount-street, London, W.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required. For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses. For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

ADMIRALTY EXAMINATION for ASSISTANTS now announced. Preparation by correspondence, personally or resident. First place on two recent occasions.—G. A. T. MIDDLETON, 19, Craven-street, W.C.

PERSPECTIVES Artistically Prepared. Terms moderate.—G. W. C., 46, Lincoln's-inn-fields.

TELEGRAMS: LONDON TELEPHONE No. 1011, Holborn
"Dividore, London."

DRAWING & TRACING OFFICE, 98, Gray's Inn Road, Holborn, W.C.
(Adjoining Holborn Town Hall.)

MANAGER, JOHN B. THORP, ARCHITECT & SURVEYOR.
Cheques Crossed. The City Bank, Ltd.
Office hours—Nine to Six. Saturdays One.

Established 1883.

For the PROMPT and EFFICIENT execution of all work usually required by the PROFESSION, such as

WORKING DRAWINGS, TRACINGS, PERSPECTIVES, SURVEYS, COMPETITION DRAWINGS,

Black Line PHOTO-COPIES and Blueprints. Quantities, Specifications LITHOGRAPHED.

MODELS. TYPEWRITING, &c.

TRACING and PRINTING Rooms, HATTON GARDEN, connected by Private Telephone.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

GOOD PLASTERERS WANTED at once. —Apply J. HILTON, 37, London-road, Lynn, Norfolk.

WANTED, ARCHITECTURAL ASSISTANT in Municipal Office of large Midland town. £2 10s. per week.—Apply, enclosing copy tests, Box 729, BUILDERS' JOURNAL Office.

TERRA-COTTA MODEL and MOULD MAKERS, also PRESSERS and FINISHERS, WANTED.—Apply by letter, STIRR and SONS, Lambeth, London.

ARCHITECTURAL ASSISTANT (thoroughly qualified) WANTED, who must be an accurate and expeditious draughtsman, good at design, and competent to prepare working and detail drawings. Salary £104 per annum.—Applications, stating age, experience, accompanied by copies of testimonials (which will not be returned), to be forwarded to No. 116, Times and Mirror Office, Bristol.

ARCHITECT'S ASSISTANT (competent) WANTED three days a week in City office.—State qualifications, age, and salary required, to M., care of Messrs. Hooper and Batty, Advertising Contractors, 15, Walbrook, E.C.

DRAUGHTSMAN (Young) WANTED in a Manufacturer's office, good designer. One willing to interview Architects and make himself generally useful in office preferred.—Apply, with experience, reference, age, and salary required, to JOHN P. WHITE, The Pygate, Bedford.

ASSISTANT WANTED, who can survey level, and prepare working drawings. Salary, £2 2s. per week.—Apply, with references, to Mr. G. B. LAFAN, Surveyor, Town Hall, Twickenham.

DRAUGHTSMAN.—WANTED at once, in a Surveyor's and Estate Agent's office ten miles north of London. DRAUGHTSMAN; competent to design villa and shop property, and able to level and survey and prepare detailed specifications. Good writer indispensable.—Apply by letter, stating previous experience, age, and salary required, to E. FERGUSSON TAYLOR, New Barnet, Herts.

ARCHITECTURAL DRAUGHTSMAN (well qualified) WANTED. Send specimen drawings in pencil, and photo portrait.—State qualifications, salary, age (should not be less than 30), and apply by letter to FRANK W. RICH, 1, Eldon-square, Newcastle-on-Tyne.

DRAUGHTSMAN (first-class) WANTED immediately. Must be thoroughly capable of making good drawings from rough sketches; good knowledge of design and construction, and not less than ten years' experience. Permanent engagement probable. Good salary paid. State age, references, experience, terms, &c.—Address, ARCHITECT, 9, Portland-street, Southampton.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES to ASSIST others in the PREPARATION of DRAWINGS at his own office.

G. SCOREE, 23, Newman-street, W.

TWO DRAUGHTSMEN, with ten years' London experience in libraries, schools, warehouses, hotels, &c., and all constructional details, are prepared to ASSIST ARCHITECTS at own home.—Box 722, BUILDERS' JOURNAL Office.

ASSISTANT (Architect's), highly qualified as a designer, planner, and constructionist, DIS-ENGAGED. Practical and artistic draughtsman. Used to extensive work. Competitions, London or country.—ART, "Hydro," Knutsford, Cheshire.

ARCHITECT'S JUNIOR ASSISTANT (18) seeks RE-ENGAGEMENT. Three years' experience. Inking-in drawings, tracing, &c.—Address, A. H., care of C. O. Blick, No. 76, Bridge-rd., Battersea.

TWO ARCHITECTS and SURVEYORS.—GENERAL ASSISTANT wants ENGAGEMENT. Five years' experience. Neat draughtsman. Competent to survey and take levels, and with good general knowledge.—S. E. T., 37, Queen's-square, Holborn, W.C.

ARCHITECT'S and SURVEYOR'S AS- SISTANT (young) REQUIRES RE-ENGAGEMENT; good draughtsman, well up in construction, details, quantities, &c.—23, Nelson-street, Leicester.

ARCHITECT'S ASSISTANT desires CHANGE. Provinces preferred. Good general draughtsman, and knowledge of surveying, levelling, and quantities. Six years' experience. Excellent references.—"Cornice," 47, Fleet-street, E.C.

The Pedigree-Builder.

THERE are not wanting signs that the interest in heraldry has revived and been quickened again. In London we learn that our American cousins are prepared to pay almost anything for proof of blue blood in their veins, and as this carries with it the right of which the escutcheon is the outward and visible sign, there is work every day for the herald.

and thus was our history made before Caxton set up his press. It is possible to write a sufficiently complete family history if only the arms successively borne by the heads of the house can be shown, and, reversing the situation, the pedigree-builder may find sufficient in history to re-establish a name which has become ignominious by careless misuse. Instance Snooks, derived from Sevenoaks, *via* Sennoks, as Bret Harte explains to his friends. A handbook to this particular subject cannot, it is thought, be too elementary, and Mr. Wade's little volume deserves to be praised for the reason that it claims to be nothing more. The reader may have neither time nor inclination to give his whole mind to the subject, and the writer of this brief notice is with him, but one quickly discovers in particular cases whether the method pursued is the best, and the author of this may be sure that it would have been thrown aside in a moment if it had proved in the least disappointing; but, such as it is, it can be cordially recommended. The subject becomes more difficult as we proceed, but the student who is on the right way will

take it, and hath great need to be reformed, is the quartering of many marks in one shield, coat, or banner; for sithence it is true that such marks serve no other use but for a commander to lead by, or to be known by, it is of necessity that the same be apparent, fair, and easy to be discerned, so that the quartering of many of them together doth hinder the use for which they are provided."

E. R.

Our Bridges.

WHEN Mr. W. S. Gilbert, in the course of a certain opera, took occasion to satirise the popular failing of dispraising the artistry of to-day to the glory of that of a day that is done, he castigated a very superficial and insincere form of reckless criticism. When he wrote the lines:—

Of course you must pooh pooh
Whatever's fresh and new,
And declare it crude and mean;
For Art stopped short
In the cultivated Court
Of the Empress Josephine.

He put those critics, who find decadence in

INGLE IN A BILLIARD ROOM. DESIGNED BY F. STUART MURRAY.

A little knowledge of this supremely decorative art is far from being a dangerous thing: and so far indeed as to be, in the writer's opinion, invaluable. It may be remembered, perhaps, that the employment of heraldic devices in Architecture was made the subject of a fascinating lecture by a member of the Art Workers' Guild not long ago, who was able, by means of the lantern, to illustrate, point by point, what he said, and greatly delighted his hearers. In the counties of Norfolk and Suffolk, where flint pertains to the soil, the courses of freestone, whether horizontal or vertical, give the distinction of style to the churches. The said counties, it will be remembered, were then the richest in England. So wealthy, indeed, that good Art could be properly paid for, and we find very often the surface relieved by panelled designs in which the founder's arms are conspicuous;

know better than one who is not, where to stop. When it comes to converting a shield into a complete geneological table and family history combined, the herald, it will be perceived, is well-nigh at his wit's end. What concerns us especially is that the design loses in dignity, and commands less respect as it gradually becomes more involved. The older he gets the longer is History's tail! Mr. Wade leaves off at this point as if as much had been said as could be expected from him. To go further is to fare worse, however, as we should presently come to such matters as cadency, differencing, dimidiation, impalement, quartering, agroupment, &c. The names are indicative of the devices employed by the herald, whose profession obliged him to move with the times, and to cram more and more into a naturally limited field. The author might here have quoted from Dugdale, born 1605, whose position as Royal Herald was gained by his works on this subject: "A thing 'that is amiss, as I

everything modern, somewhat out of countenance; but these words lose their satirical sting, and become a sober statement of fact when applied, for instance, to our Thames bridges. Generally speaking, it was at about that period in the first quarter of this dying century that the last bridge across the London Thames to claim any real architectural merit was built. One names, of course, in this connection, Waterloo Bridge. Most of the later examples are, indeed, either crude or mean; and the design for the new Vauxhall Bridge, presently to be begun, is just as commonplace as, for instance, those miracles of featureless utility, the new Putney and Wandsworth Bridges. We apparently lost the art of building a bridge with strikingly good architectural features when Rennie died. Since then, the engineer, with his iron and steel spans, has had the best opportunities, and we must needs suppose that it is because his services are not so often required (and his faculties in this direction

* "The Symbolisms of Heraldry." By W. Cecil Wade. London: George Redway. 2s. 6d.

therefore become somewhat dulled), that the architect of recent stone bridges has failed to produce anything better than a mere draughtsman's design. What puts a keener edge on one's regret in this direction is that many of the old bridges, demolished to make way for these featureless, if stronger structures, were so very picturesque. Londoners have not ceased to regret the vanished quaintness of old Putney Bridge, or that of old Wandsworth Bridge, both crazily timbered affairs, but so inspiring to the artist—and possibly not so crazy after all. Then there was the old bridge at Battersea, that made the reach just there the most delightful river "bit" near London. It went somewhere about five years ago, and the reach between Battersea and Chelsea is now vulgarised by two exceedingly pretentious suspension bridges, one of them tricked out with tawdry gilding and crested with gas lamps, the other a bleak and barren offence to the eye. The frankly hideous Lambeth Bridge even is better. It is, indeed, so hideous that, like the repulsiveness of a Japanese grotesque demon, it has a personality of its own rather winning upon one at last. But we have one really beautiful modern bridge in London that deserves every praise. Westminster Bridge is no unworthy neighbour of Barry's Gothic pile of the Palace of Westminster, whose Tudor tradition it carries across the river to the Westminster Bridge Road and the Albert Embankment, on which stand those flaunting red brick and Portland stone Italian Renaissance buildings of St. Thomas's Hospital, good in themselves, but in too violent contrast with the bridge and the Houses of Parliament. The light, four-centred arches of that fine bridge look absolutely perfect at half tide, when their piers are half submerged, and at all times that structure is an admirable object lesson in the artistic combined use of iron and stone. Beside it the heavier Gothic of Blackfriars Bridge is poor indeed, and that huge castellated structure by the Tower of London frankly impossible.

C. G. H.

A NEW isolation hospital at Isleworth, for the joint use of the boroughs of Richmond and Hounslow with Isleworth, has been opened.

THE competition for a design for new schools at Trowbridge has elicited sixty-seven sets of drawings which are to be on exhibition during the three concluding days of this week.

DIGGERS and delvers have been busy lately. Mr. Hogarth's English School of Archaeology at Athens has been doing good work in its excavations on the isle of Milo. The missing arms of Aphrodite, it is true, have not yet been found; but primitive fresco paintings of great value and interest have been brought to light, and another Acropolis has been discovered. Meanwhile the treasures hidden beneath British soil have not been neglected. At the Society of Antiquaries in Burlington House are to be seen the results of the latest excavations in Silchester. Half the old city (or nearly a hundred acres) has been now examined, and the arrangements made for warming the Roman houses with hot air, and other contrivances, are of the most interesting description, and suggest that our climate must have improved since the villas of Silchester were turned into fields of standing corn. Several large casks, one full of Old Falernian, betray other means employed by our invaders for keeping up their caloric, while the quantities of oyster shells found close at hand suggest that "natives" were thoroughly appreciated and treated to their appropriate accompaniments at table. The buried civilizations of Greece and Rome are gradually giving up their dead, in various quarters of the world that once was theirs. And the pathetic little relics that are brought to light show more and more how little we have changed since Silchester was guarded by the lictors, and Milo echoed to the songs of worshippers before its temple.

THE ARCHITECTURAL FREAK.

LEFT to itself, the architectural freak is not greatly gifted with a spirit of originality; as a general rule, it has to be built stone by stone on the lines of a plan suggested by some human eccentric, and even then it fails to bear the proud title of "freak," for it is usually known, in this country at all events, as "So-and-so's folly," but there are exceptions. In a certain town in Italy discovered by Cook there exists the "doyen" of architectural freaks, in the shape of the tower that has a distinct bias on one side—a bias achieved by the sole exertions of the structure itself without the intervention of human hands. This tower having achieved great popularity—few, we believe, of the casual visitors to Pisa, for that is the name of the place, have the strength of mind to leave the town without visiting and purchasing a photograph of

THIS GREATLY ADVERTISED ERECTION,

—other towers naturally essayed to eclipse it in leaning, but, notwithstanding that the "Falling Tower" of Caerphilly Castle, in Wales, throws its head, which is 77ft. from the ground, 11ft. out of the perpendicular as compared to the 14ft. bias of the 60 yards of Pisa's pet, the latter has never lost its hold on the public's affection, in which its foundations are deeply rooted, nor do we think it will loosen its grip, notwithstanding the efforts of Chesterfieldian champions on behalf of their crooked spire. This spire, which most closely resembles a bayonet as made in Germany after an encounter with a sardine tin undoubtedly possesses claims (says the Globe) to be known as the champion of Architectural freaks, and in making this assertion we are not influenced by any leaning on the grounds of nationality—the spire attends to that department—but because there is, unlike the subsidence of

THE FOUNDATION AT PISA,

no reasonable explanation of the spire's caprice. Optical illusions, lightning, and warped woodwork have all been suggested, but a first-class theory is still wanting. Had Phillip II. of Spain lived to-day the Escorial would be known as "Phillip's Folly," but, as he sojourned in this world in the sixteenth century, his contemporaries acknowledged that the building of the palace in the shape of a gridiron as a compliment to St. Lawrence, upon whose day, in the year 1557, he defeated the French at St. Quentin, was nothing short of a delicate attention and a prodigiously clever idea. There were, by the way, some vastly uncomfortable cells at their disposal had they said otherwise. This novel form of compliment is perpetuated in our country, it is alleged, in that charming example of Tudor Architecture known as

"CHARLECOTE HOUSE,"

the ground plan of which was built in the shape of an "E," in honour of Elizabeth Regina. When aerial navigation is an accomplished fact, this idea will probably be adopted for advertising in our great cities. To see "—'s Cocoa is the Best" neatly picked out in terraces, squares, and streets, would doubtless be as delightful and stimulating as the article advertised. If the little Northamptonshire village of Rushton were not situated in longitude 10°21' E., the travelling Britisher would visit it in crowds, and philanthropic societies would extensively advertise their personally-conducted trips thither; indeed, "a week in rural Rushton for £5" would be as familiar in our mouth as household words. Rushton, it should be explained, possesses one of the freakiest buildings in the wide world, in the shape of a triangular house erected some three centuries ago by a fervent Roman Catholic, Sir Thomas Tresham, who is supposed to have had the idea of typifying the Trinity in his design. There are three sides to the house, each 33½ft. in length, and in height it is three stories; three windows

grace each of the three sides, and six of them are in shape trefoils; naturally the panes of glass are triangular. From the meeting place of the roof of the three gables on each side rises a three-sided chimney, and through three holes that perforate the three sides the smoke escapes when there is any. Each of the gables bears a three-sided pyramid crowned by a trefoil, and each of the three Latin inscriptions gracing the sides contains thirty-three letters. The interior of the house is so arranged by the cutting off of corners that on each floor there are three-sided apartments. In very sooth, everything in this remarkable house is in threes, with the exception of the number 5555 carved over the doorway. Why these figures should appear there is a mystery, for in no circumstances will three go into it without a remainder. Another architectural freak having a religious significance is

JEZREEL'S TOWER AT CHATHAM,

built under the direction of one White, who, under the name of James Jerusha Jezreel, gathered together a numerous following who called themselves "Jezreelites," and who were to be immortal—at least, they were given to understand they were. Unfortunately, the founder of the sect died before the completion of the tower, which was built from plans supposed to have been received from the Heavenly Jerusalem to accommodate the 144,000 chosen. Some little time ago the property, upon which £40,000 had been expended, was put up to auction, but, notwithstanding the auctioneer's suggestion that it might be converted into a "brewery or a lunatic asylum," no sale was effected, though the breaking-up price was but £6300. In the castle grounds at Midford there stands a tower which has claims to be regarded as a bona-fide freak of the second class, inasmuch as its ground plan reveals the fact that it was erected in the shape of the ace of clubs. There is, of course, the obvious legend attached to the building, as well as a priori, to account for the strange shape adopted, but the erection cannot be regarded in the first flight of freaks, and would probably, in more senses than one, be looked down upon by such eminent examples as the crooked spire of Chesterfield and other naturally deformed Architecture. Among the many suggestions of features warranted to secure success in the Paris Exhibition of 1900 one of the most startling was the idea of erecting the

"WOMAN'S BUILDING"

in the shape of a woman's head; not an ordinary head either, but one that would be typical of feminine beauty. Whether the model obtained from a composite taken from the photographs of the most beautiful types of modern women would give a result that would secure votes of approval from 1 per cent. of the feminine beholders we do not know, but a plebiscite would be full of interest. The details of this proposed architectural freak are remarkable. We learn, for instance, that beneath the layer of thin wood which bears the complexion of the fair but exaggerated composite powerful electric lights will be arranged. The wood, we are given to understand, will be "of some variety that is not opaque," while the electric light will be of sufficient force to penetrate the complexion and give the latter a soft, translucent effect that will be decidedly charming at night. With regard to Juliet, Shakespeare wrote:

There lies more peril in thine eyes
Than twenty of their swords.

What he would have said had he lived to-day concerning the powerful electric arc-lights which were to illumine the orbs of the proposed Architectural freak we cannot conjecture, but we trust he would have altered the latter part of the quotation, or, saving his nationality, he might have found himself literally in the same box as his distinguished comrade—in a literary sense—M. Zola.

THE foundation stone has been laid in connection with the proposed restoration of Swinton Parish Church, which was destroyed by fire—with the exception of the tower—last March.

FRIEZE, IN KIOSK AT NAVAL EXHIBITION. DESIGNED BY F. STUART MURRAY. T. E. COLLCUTT, ARCHITECT.

Men Who Design.

MR. FRANK STUART MURRAY.

THERE is a tendency to prate of Architecture as "The Mother of the Arts," without recognising the relationship thus involved between the architect and every designer of the beautiful. For many years the architect has wrapped around himself a professional cloak of his own devising, which has had the effect of separating him from his fellow artists. Although this state of things is no longer extant to any marked degree, it still exists in the relationship between the architect and the decorative artist. It is difficult to realise how dependent the architect is upon the services of the decorator until one has been brought in contact with the personal work of the latter. Although the individuality of any artist, whether decorative or otherwise, is only interesting in so far as it effects the artist's work, yet, in proportion as this is the case, his personality is worthy of study and attention.

The subject of the present article, Mr. Frank Murray, is eminently interesting, not only as a decorative designer of a high order, but as a man whose intimate acquaintance with a large range of subjects, apparently extraneous to decorative art, gives to that art a breadth and a variety which is seldom found.

Through sumptuously furnished showrooms, past exquisite examples of vertu, and up quite a wonderful number of stairs, one at last arrives at the studio, which is at the top of Messrs. Waring's premises in Oxford Street. It is quite refreshing to inhale the atmosphere of Bohemia after the almost oppressive luxury suggested by the showrooms, and it is here that Mr. Frank Murray, who is the art director of this vast business, is to be found; it is here that he points out with an almost fatherly pride the various features of his creation.

"My life as a painter," Mr. Murray begins, "is really of little interest to the general public, therefore we will hurry over that portion which relates to my earlier history, in

order to dwell more particularly on the object which has animated me for the last few years. It seems to me my function, if I have one, is the creation of an artistic and practical decorative studio. To this I have devoted, and shall continue to devote, my untiring energy. I began life, of all things in the world, as a stockbroker; this, however, did not last very long, the infinite possibilities of making everything, even the smallest domestic article, beautiful, leading me to enter the studio of a firm of decorators. This, mind, was when I was quite a young man, and a studio in a decorative firm at that time was a studio only in name. I found an atmosphere of commercialism and an utter absence of Art appreciation, a combination between the spirit of the decorator and the draper's assistant. After some time at that most disheartening business I left, and determined to devote myself entirely to marine painting, particularly shipping. Therefore a large portion of my life has been spent in this way, executing commissions for the P. and O., The White Star Line, and other large shipping companies. But always I have had in my mind the disappointing effect of my early experience in the decorator's studio, and it was this which led me to accept Messrs. Waring's offer, two years ago, to direct the art section of their business. I accepted on the condition that I was allowed a perfectly free hand in the means I employed to further the object I had in view. I have not only had a free hand, but the greatest support and assistance in the formation of my studio from the heads of the firm. My ideal is a studio founded upon the principles which animated the Art of the sixteenth century, and I believe nothing could stand against it. In sixteenth century Applied Art you can find nothing really bad. Almost up to the end of the eighteenth century this state of things exists, then comes the decline and fall."

Mr. Murray's views on the commercial spirit which may be attributed to any studio directly connected with a business firm, are singularly helpful and interesting.

"During the last few years there has been a great revival in applied and decorative art, as distinct from the art of the picture painter. This is mainly attributable to the "Arts and Crafts" and "Art Workers' Guild," truly living societies. Yet such a lot of the charming work done and exhibited is either not suitable to practical requirements or else far

too costly for the average pocket. As long as Art is not brought within the exigency of commerce, any real movement towards a reformation of public taste is amateurish and dilettante. What is wanted is someone to stand at the parting of the ways of Commerce and Art, and it is precisely this position which I hope my *atelier* will occupy. This is, I am convinced, the only practical method of focussing the heterogeneous mass of artistic material at our disposal, and making it homogeneous.

"You ask me about 'style.' Well, I am not a bit of a stylist. At the same time, I have no doubt that an intimate knowledge of styles is as imperative to the decorative artist as to the architect. Style is the concrete expression of the manners, customs, conventions, and ideals of a period. I find the greatest possible difficulty in getting artists—and I have ever so many applicants—to realise the necessity of this foundation to their art. Hence I find it necessary to train young men, if I am to realise my ideal *atelier*. The system I adopt is not that of ordinary pupilage. To begin with, I take no premiums, but, if the parents of a boy can support him for three years, during that period he should spend his days studying under a most rigorous scheme. Every line he draws is with a practical object in view. Chairs, tables, fenders, from the best of the many beautiful examples at South Kensington and elsewhere. Every week the pupil submits his work to me, and it is freely criticised in the studio, suggestions, objections, and so forth being expended upon it. I have often kept a pupil for weeks drawing nothing but sections of mouldings; after he has drawn several hundreds, he will find that they divide themselves into two classes, the mediæval and the classical. As he continues, the pupil will gradually see the moving vital spirit which underlies these classes, and so, catching this spirit, he will become not a mere copyist, but an artist fully qualified to take his place in the studio, and help forward the work.

The beautiful work which is being executed in the studio is the best proof of the system which Mr. Murray has adopted. Mr. Murray, who is a member of the Arts and Crafts Society and the Art Workers' Guild, is a constant exhibitor at the Royal Academy; for seventeen years he has been represented on the walls of Burlington House, this year's exhibition being no exception to the rule.

FRIEZE IN KIOSK AT NAVAL EXHIBITION. DESIGNED BY F. STUART MURRAY. T. E. COLLCUTT, ARCHITECT.

POMPEII.

By ANATOLE FRANCE.

(Translated from the Figaro.)

AFTER having climbed by a dusty road a hill covered with olive trees in a conveyance which was as rustic as the lyre of Homer, we alighted before an inn situate about two hundred steps from Pompeii. The inn was shaded by some acacias, and was called by some ancient name; you are sure of meeting

appeared to be quite ripe and well-developed, and, that being the case, the great event could not have occurred earlier than the end of the autumn; thus the triumphal shrub decided the question in favour of those who held out for November. I have related this little incident with the care of an inquisitive traveller. Some savants are, however, still doubtful, and I must say I have questioned no one in Pompeii about it. I have only disturbed the little grey lizards which bask in the sun upon those ancient walls.

In this solitude one experiences those strange impressions, impressions which magic should produce, that is, if magic were truly

Between the pilasters they traced landscapes, vines, fountains, wreaths, and birds.

Upon a dark background, giving a void effect, they suspended airy figures of dancers. In short, they designed with a knowledge often tolerable, yet with much taste and ingenuity, mythological scenes, great compositions proceeding from a known original, which they modified according to their suitability or caprice. They had books of designs and subjects, from which the well-to-do Pompeian generally chose by preference voluptuous subjects, and under his portico were portrayed Achilles, and Briseis, Apollo and Daphne, the awakening of Ariadne, the faun unveiling a

"WAR."

there a good many travellers, men of tall stature, of unyielding gait, square heads, and of light complexion, attributes typical of the German professor, who, following the example of Faust, come to conquer Science and Beauty. Leaving the inn, and following the ruin of the Roman wall, we enter Pompeii by the Stabian gate, where a turnstile is established, and with the same step which carries you through it, you have crossed the threshold of eighteen centuries, and find yourself in a city just as it appeared in ancient times.

The sovereign dignity floats yet o'er its deserted bed.

It is generally known that Pompeii was buried with Herculaneum, Stabies Oploutus, and Retinus, under pumice stone, boiling water, and cinders which were vomited by Vesuvius in the first year of the reign of Titus (A.D. 79). But the archaeologists were not agreed as to the month in which the eruption took place. Some contended that it was in August, others November. A bay tree, however, appeared, which ended the dispute. It grew in the town during the time of the Cæsars upon the boulevard near the Stabian gate; it appeared on the right hand

the art of evocation; one feels them whilst traversing those straight streets with irregular flagstones, in which the Roman chariots have made deep ruts, and along those painted houses, through the door frames of which you can see columns of stucco, marble basins, and painted walls. But although these houses have lost their roofs, yet they still seem to be awaiting their ancient occupiers. The word SALVE, which is traced in the mosaic of the threshold, seems yet to promise a favourable reception. The aspect of those beautiful halls seems scarcely to have changed at all. They were always open to the sky, and surrounded by a portico, over which was extended a veil. Water once flowed in the fountains with a cool murmuring, but now has long ceased to babble. Bronze chairs, marble tables, lamps, candeliers, busts, and statues have all been taken away with the best of the mural paintings; yet the charm is not broken, the Venus of Pompeii smiles still in her own city. One can imagine that she is sleeping, and that she is not dead. There she is a peaceful Venus, a Venus of the crossways and of the gardens. You see her many times represented in the frescoes, seated upon a stone and fishing with a line. The frescoes of Pompeii are delicious; they were, however, for the most part hastily executed by

sleeping nymph, truly a spiritual and charming idea; and the toilette of Hermaphrodite, which is a composition in Oriental style. As they had special apartments for their love affairs, these apartments were decorated with elaborate tableaux. The Pompeian was not chaste; neither his gods nor yet his climate induced him to be. But if he were a disciple of the Greeks, he had in all things a sense of propriety, and we must recognise in him the delicate taste with which he chose the necessities of life, in which relation he was by far our superior. I should regard as an honest man, the wine merchant who had the Faun and the mosaic of Alexander in his residence, in which reigned a becoming grace and refinement. As regards the possessor of those exquisite reliefs designed upon marble, now in the Naples museum, I should proclaim him happy, that is if he knew the value of what he possessed, for in his day they must have been already antique and of the most beautiful antique—a fragment in the pure style of Polygnotus.

I have a great respect also for the philosopher who, in this city where few studied, wrote a few short treatises which have been found in a state of carbon. He was a disciple of Epicurus, and if perchance he conformed his

"PEACE."

DESIGN FOR MOSAICS OF ANCIENT AND MODERN SHIPPING. BY F. S. MURRAY.

as you entered. This bay tree was buried alive under the shroud of mud which enveloped the five towns. As the bodies of men and animals which had fallen under this sepulchral rain, and as the woman who came with her two companions to throw themselves at its feet, so the beautiful tree was buried and became dust, leaving the impression of its trunk, its foliage, and its bays in its hardened ashes. It was only a few years ago that a hole so formed was revealed by a blow of a pickaxe, and in accordance with an ingenious method which has been in use now for some time, plaster was run into the hole, and thus a cast of the bay tree was obtained. It was recognised as belonging to that species which is now used for culinary purposes. The bays

craftsmen, doubtless very ordinary, in the short space of sixteen years, comprised between the earthquake of the year 63, which ruined the town, and the eruption of 79 which buried it. Art sustained a great loss then; some of the most ancient decorations, however, have been recovered. They are very beautiful. They are conceived in that great style which is called the candelabrum style, because the principal motives reproduced in it were those flowered stems of bronze which the Greek artists were so well able in throwing out in the form of a graceful and majestic branch which served to carry the burning torch. The painters who, after the year 63, came with their rolls of tracing to decorate the houses restored from their ruins, had an exquisite sense of ornament.

life to his doctrine, he had great contempt for Venus, the Venus with black tresses, so much adored by the Pompeians.

The Epicureans preached abstinence from all carnal pleasures, albeit the reasons for which doctrine were much too deep for the comprehension of the commoner people. This sage, I should imagine, was very isolated—a total stranger in that clamorous and wanton throng.

Still there were to be found here and there a few cultivated minds in this little town where Cicero once lived, but they were very rare, isolated for the most part, and concealed in their lovely gardens under the shade of the terebinth trees, or else shut up in a wretched little room and surrounded by manuscripts.

Those people who prevailed in the streets were necessarily of the commoner classes, such as merchants, clerks, lawyers, doctors, artisans, slaves, soldiers, sailors, gladiators, panders, courtisans, and all that filthy scum that the pirate-infested sea deposited upon the shores of Campania and in the maritime towns.

Pompeii was a gay city, but it was, at the same time, a business centre. Jocundus the banker devoted himself to many profitable transactions, the details of which are known, for his books have been found. In the courts of justice they argued tremendously, and the walls thereof were literally hidden by the legal notices which were affixed to them; a poet once declared himself astonished that they did not fall down, so terrible was the cavilling and wrangling which was carried on within. Public life was very active, and candidates for the municipal offices daubed the walls with their names, which were written in a large, bold handwriting, a custom still in vogue in some of the towns in Italy.

Their chief place of amusement was the

The house owners here who, thinking that all capital should be production, opened the ground floors of their houses as shops, which they let out to traders; in fact, notices of shops "to let" have actually been found. Among all those shops now brought to light there is not a single library, but as regards taverns and drinking shops there are many, one of these was seen which had for a sign two men carrying a pitcher.

The Pompeian tavern, with its marble counter, was very like the "antica osteria," which one meets with in the alleys in Naples; both food and drink were obtainable there.

Upon the wall plaster of one of these taverns a design was scratched (probably the work of some belated idler), in which one can see, among other things, a customer calling to a waiter and saying: "Give me a little fresh water." Like the modern Neapolitan, the Pompeian of old did not despise water, but at the same time he would not pay for it as he would for wine; one evidently discontented tippler wrote upon the wall of one tavern this

of cooking pervaded the air, whilst from amidst the crowds of fruitsellers arose the cries of the muleteers and the laughing of naked children. The quarrels of the soldiers, of the sailors and of the gladiators disturbed the night. Actors, prostitutes, vagabonds, and robbers there fulfilled their various professions. Thus I pity Syricus, and though I do not sympathise with him, yet his unfortunate condition touches me. I will tell it you.

Syricus was a merchant, probably a cloth merchant, for in his safe have been found several samples of stuffs. He was naturally a grasping character, and thought of little other than making money. In his house, which is situated near the Stabian Gate, he had not, as was the custom, inscribed upon the paving of the vestibule a favourable motto, one of good augury to the addressee of his customers; but instead thereof, the mosaic of the threshold carried this uncouth wish: "A welcome to profit." This was rendered again in an incorrect but popular form of Latin. Syricus was very wealthy, and his house, judging by

"THE SCIENCES." DESIGN FOR A FRIEZE. BY F. STUART MURRAY.

amphitheatre, in which the gladiators contended with the wild beasts. Eating and drinking, loving, laughing, quarrelling, and constant fear of the evil eye was the order of the day. For the purpose of conjuring the evil influences they carried charms, also certain emblems were placed on the doors and upon the furniture. One citizen of Pompeii, a tanner by trade, had a death's head, in mosaic, upon the table of his dining room; its purpose was to bring him good luck.

In the plate given last year to the Louvre there are two cups, once the property of a wealthy Campanian, one Trimalkion of Vesuvius. These cups are ornamented with two skeletons in high relief. The Neapolitans of to-day even carry little skulls of red coral in their collection of charm trinkets. Just as Trimalkion of old did in contemplating his articulated skeletons, so the tanner of Pompeii had a subject for meditation whilst taking his supper in the rapid flight of his days; and he would be able to conclude, according to his disposition, whether he should hasten to enjoy himself, or whether he must despise ephemeral pleasure.

imprecation: "May the gods visit thy sins upon thine own head thou that sellest water, having thyself drunk wine." The man of the lower classes in Pompeii ate his meals in the street, in fact, he lived out of doors, and facts tend to prove that they were not ashamed of any of the functions of life; he was of a gay disposition, imaginative, and not at all too coarse in his speech. One reads in places erotic inscriptions, which are delicately worded; one amorous individual has written upon a wall in Greek the words, "Thou, my life and my soul," and we know from Invenal that these are significant words. In the house of Primus, he who left his dog chained up during that terrible hail of cinders and stones, a hand had written under the portico of the garden these lines: "Who can hinder love? Who shall restrain the lover?" Then comes this imprecation: "Let him die a double death who would impede the course of love."

One must imagine those alleys which now are deserted and silent as noisy and animated, like the little lanes or side streets in Genoa, Naples, or Palermo. In the morning women could be seen combing their hair, and a smell

what now remains of it, was very sumptuous. He shared it with a relative, each having his particular entrance and separate apartments. In those of Syricus, a few and very pleasing frescoes are to be seen; this uncouth and unlettered man had the Muses depicted upon the walls of his parlour. But this fine building overlooked a filthy lane—a lane frequented by the lowest of the low. On the opposite side of the way from Syricus was the tavern of Sittius, with an Elephant for a sign, it was a wretched place; then adjoining him extended a large hostelry of filthy aspect. But this was not all, for on the left hand lived a matron with her bevy of complaisant maidens, and I assure you that in Campania during the time of the Emperors the windows of the house were never closed. One poor creature, a humble competitor, occupied on one side a chamber so small that it was necessary to make a hole in the wall for the bed. In this alley abounded, as one can imagine, rakes and vagabonds. Here in this fair Encolpe, so full of literature, there prowled at all hours representatives of the species, the parasite, the robber, the debauchee, and the sacrilegist, who stole from the inns the

coats of travellers, and who visited the ship of Isis which was moored in the harbour, and even dared to rob the goddess of her embroidered robe and her silver sistrum; in fact, one must have traversed at night some back street in Old Naples before the least idea can be formed of the world that lived there enjoying a liberty unknown to the austere people of the West. Whilst Syricus busied himself with his accounts at night, or whilst resting himself on his bed, drunkards rolled about outside, stumbling over fragments of broken pottery, and howling; ostlers, soldiers, gladiators, sorcerers, courtesans, and slaves, who quarrelled in the low inns and other degraded places, felling one another with candlesticks and fighting with smoking spits, altogether making a frightful uproar. Poor Syricus, his ears all but broken by the din and his safe broken into by thieves, had painted on the wall outside two serpents encircling an altar, which sign was according to the common belief efficacious in exorcising the evil influence and perils with which he was surrounded. Over the serpent was written this inscription, now effaced, although it was easily read at the time of its discovery: "Tarry not here, move on scoundrels." There is no knowing what effect it had, but it is most probable that this vile crowd still shrieked beneath those serpents, not caring much for the written injunction, and that this wretched street became quiet only under the cinders of Vesuvius which buried it.

The reader will reproach us, perhaps, for having remained unreasonably long in this low quarter. It is at the other extremity of the town, at the end of the Rue de Stabies near to the gate of Vesuvius, where the excavations are being carried on. For a long time led without order, they are now conducted with method. The frescoes are all being left in place, under the protection of a roof or else covered with glass. This has been done in the "Casa Nuova," recently exhumed, and which is now rendered to us with all its furniture and the adorable friezes of Love's craftsmen. At the entrance of this house is a painting, which really should be taken to a private museum and even then should be covered by a screen; all that I can say of it is that it represents a man, who, holding a balance, seems to express this idea—that pleasure is dearly bought. That is another house which one cannot call respectable. Rich and poor, craftsmen and merchants, soldiers, conjurors, temples, palaces, hovels, sewers, all these put together make a city, that is to say, an event—a pathetic event—a great human reality, and in the abysses of the past, a sacred reality.

A NEW Wesleyan Methodist chapel was lately opened at Chelmsford.

The foundation stone of new schools at Neath was laid a few days ago. The contract price of the new building is £5400.

The Cleethorpes Urban District Council has determined to widen the Grimsby Road. The surveyor has been instructed to prepare plans and submit an estimate for the work.

A LOCAL GOVERNMENT BOARD inquiry into the application of the Devonport Town Council for power to borrow £9250, for the purchase of land as a site for the erection of municipal buildings, was held a few days ago.

BUILDING operations have been in full swing at Skegness during the past winter. Two fine terraces have been nearly completed, and a Roman Catholic church, a Primitive Methodist chapel, and other buildings are now in course of erection. The Pier Saloon is being enlarged, and other improvements are being effected.

ACCORDING to the annual report of Mr. Vice-Consul Keogh, the years 1896 and 1897 have been prosperous and successful for the principality of Monaco. Building has been unusually active. Land has become scarce and expensive and at Monte Carlo there is difficulty in finding any. An electric tramway has been laid from near Monaco railway station to the frontier at St. Roman, passing through Monte Carlo. This is a link in the proposed electric tram line from Cagnes (a short distance on the Cannes side of Nice) to Mentone.

GREAT ART WORKERS OF THE CENTURIES.

QUENTIN MATSYS: ARTIST IN WROUGHT IRON.

ALMOST as soon as the early members of the human race learned to utilise metals for the fabrication of tools and weapons, they also applied them to ornamental uses. At first this was generally in the direction of personal ornaments, and the precious metals, gold and silver, were the most prized materials. But it is certain that the early Egyptians and Chaldeans, and probably also the first Greeks, covered some of the walls of their temples and palaces with tablets and bronze more or less ornamental. The most useful of all the metals did not come into general use in the civilised world until much later. Lord Macaulay, in his fine lay of "Horatius," says of the advance of the Tuscan army as seen from the walls of Rome by the terrified citizens:

Now through the gloom appears,
Far to left, and far to right,
In broken beams of dark blue light,
The long array of helmets bright,
The long array of spears.

With all respect to the poet, no "dark blue light" would have been visible, for the helmets and spearheads of both Etruscans and Romans at that remote date were of bronze, and the Romans only learned the use of iron or steel swords from the Goths of Spain long subsequently. Doubtless from the "masters of the world" their various dependencies became acquainted with iron. We know, at least, that at, or immediately posterior to, the Roman Conquest, both iron and steel were in general use in England for arms, armour, tools, and various architectural adjuncts. It is here that we begin to find the commencement of ornamental wrought-iron work. The Gothic builders of the Middle Ages desired to make the house of the Lord which they reared beautiful throughout, and spared no labour to accomplish their object. It was not alone that every part of the edifice, from the great porch to the slender spire externally, or from the grand chancel arch to the font internally, should be miracles of the most beautiful and most delicate stone carving, but all the ironwork—hinge and lock, bolt and bar, must be equally wrought into decorative beauty. The production of work of an artistic or ornamental character in wrought or hammered iron is a difficult process, which requires great technical skill, and the most cursory consideration of the subject will show why this is the case. The sculptor and carver, working upon marble or wood, the potter manipulating plastic clay, or the artist or decorator laying on pigment or media, can each and all work with as much deliberation as suit their views or purposes. If the sculptor thinks that the cheeks of his marble nymph have not the proper curvature, he can

CHISEL AWAY

a little more carefully and at his ease; but the iron worker must emphatically "strike while the iron is hot." He must give or impart to the metal an ornamental form while it is still at a red or even white heat, and hence his manipulation must be rapid. Nevertheless, if he be skilful, the results obtained are as wonderful as they are beautiful. As connected with the *métier* of the subject of this paper, I may mention that at the South Kensington Museum there is a fine specimen of German or Flemish work. It is a window grating, and probably contemporaneous with Matsys, if not actually his work. Another specimen is a wrought-iron open church screen of English workmanship of the period, and an excellent example of the capabilities of the material; and another excellent example of the effective employment of wrought-iron in an exceedingly simple manner is a link holder from Siena, which is also about contemporaneous with Quentin Matsys. This is an excellent example of spirited design and adequate execution in iron, the best point about

it being the ready manner in which a grotesque quasi-animal form is worked out of little more than a mere bar of metal, with forcible expression, though without any attempt at realism. But to turn now to the main object of this paper—Quentin Matsys. There are such conflicting statements concerning the "famous blacksmith of Antwerp" that the date and place of his birth even cannot be positively stated. For more than three hundred years a feud has raged between Louvain and Antwerp, each claiming him as a son. For Louvain the most formidable champion has been M. Edward van Even, who, in poring over the registers of the city, found that in 1440 Arnold and Nicholas Matsys were allowed in Louvain the immunities of burghers, and accordingly claims that Quentin is one of their descendants, as in the said city there was living from 1469 to 1530 a famous locksmith and clockmaker named Matsys. Also that Gurchardin—who, however, is oftentimes regarded as of doubtful authority—in his list of contemporary painters mentions that Quentin Matsys was born in the old capital of Brabant. Then M. de Burlrose, who examined with patient care the musty archives of the Cathedral, discovered that from 1456 to 1466 there lived one Jean Matsys in Antwerp, who wrought for the Cathedral many works in iron, and was besides entrusted with

THE FAMOUS CLOCK OF ST. JACQUES,

and that after his death, attributed to the year 1467, his widow was paid money due on the work of her husband. There is also a suggestion that the Matsys of Louvain is confounded with this one. It is considered strange there should be two of the same name pursuing identical occupations at the same time in places so near to each other. In the work of the late M. Alfred Michiels, "Rubens and the Antwerp School," published in 1854, the discussion is resumed, and M. Michiels agrees with M. de Burlrose in his conclusions. Be it as it may, though the date and place of his birth are in doubt, Matsys achieved his fame at Antwerp, and will always be associated with the quaint Flemish town, where he died. The spelling of his name is also in dispute; his son wrote it Massis, but as nearly as can be deciphered on his "Descent from the Cross," in the Louvre, he signed it Matsys. Everyone who visits Antwerp goes, of course, to the Cathedral, and if they enter there by the principal gate, the nearest way to it is through the "Place aux Gants," in the centre of which stands one of the sights of the city—the famous well. Of the many who daily draw water from it, probably few ever think of its beauty; but to the tourist and connoisseur it possesses great attractions. This well cover is supposed to have had its origin in a bet with a fellow workman that out of a single piece of iron, and with one hammer, he would fashion the well-cover—and he won the bet, being then, though called the master in iron, barely of age. Furthermore, the romance lovers tell us that, on account of his love affair with Adelaide van Wylt—whose father, a painter, regarding a blacksmith as unworthy to be his son-in-law, refused Matsys as a suitor for his daughter—the rejected lover, abandoning the trade in which he stood so high, vowed to become an artist, and travelled through Germany and even England, working at his trade only to obtain the wherewithal

TO PROSECUTE HIS ART STUDIES,

and at last he returned to Antwerp, where, as his merits were speedily recognised, the stern father yielded, and Matsys married his lady love, though the people still persisted in calling him the blacksmith. If this tale of his travel is true, it must have been then that he wrought in England the iron tomb which covers the grave of Edward IV. in the Chapel of Windsor Castle, and the incasing of the baptismal fonts in St. Peter's, at Louvain, both of which are attributed to him. In the wall of the Cathedral, by the side of the main entrance, is a stone to his memory, carved with a skull and cross-bones, and bearing this motto: "Corumbialis amor de muleibre fecit apellem." W. N. B.

RENAISSANCE WOODWORK IN ENGLAND.*

BY J. HUNGERFORD POLLEN.

(Continued from page 300.)

THE most imposing features of the houses of the seventeenth century are the great halls, with their massive tables and benches, in which the hospitalities of the owners were dispensed, and pageants, and dances prepared for the entertainment of the neighbours. The halls generally rise through the first floor, and communication across them on that floor is secured by a gallery, closed with lattices or concealed by the upper ornaments of the great screens of carved oak which divide the hall from outer entrances and from the offices. The fires were no longer made in the middle of the room, as at Westminster School, at Penshurst, and a few other places, but in large fireplaces, with imposing fronts carved with armorial bearings and other decorations. Telamons, human figures serving as piers or brackets, are favourite subjects; burly and massive figures, boldly and spiritedly carved, look down upon you from these structures, and seem to welcome the traveller to their abode; family portraits (often bad enough) cover parts of the walls.

Family trophies, regimental colours, arms that have belonged to sons and ancestors long dead, adorn these walls, to say nothing of notable stag horns, rare birds, stuffed phenomenal fish caught on the property, and the like. The halls represent the families that have lived and died in the old homes. New men who build or buy such places in our day are said to buy rows of sham ancestors and trophies of arms arranged in stars to replace genuine relics of this kind.

Next to screens and fireplaces we may name the roofs. Many halls—those of Hampton Court, of Christ Church, Oxford, for example—are roofed in the old, mediæval manner; less gracefully put together, and with the decorated parts heavier and loaded. Still, these roofs are the old mediæval roof revived, and are dignified and impressive structures. I doubt whether in the seventeenth century any country except our own retained them.

* A paper read before the Applied Art Section of the Society of Arts.

The panelling of walls was simple, but in many cases retained the old "linen" pattern, perpendicular mouldings representing napkins folded in plaits. Some of the panelling in the South Kensington Museum is set off by carved pilasters and by a frieze carved with figures of the seasons or genii, &c. But the size of the panels is ruled by the average width of the planks of heart wood from which they are cut.

The building of these roomy country "mansions" continued till the time of the Civil War. It was from the owners, with their servants and tenants, that the Royal armies were recruited.

It is time now to turn to an architect who did much to bring what I have called the academic Renaissance into fashion, and Renaissance woodwork into line with it. I do not call the early changes introduced by Henry and Elizabeth, the early modest adoption of Corinthian columns and other antique ornamental detail, academic. It did not take its origin from written rules, mechanically worked out in treatises and books, but by following living men who had been trained in older traditions, and superadding to them what impressed them in the old temples, triumphal arches, and ruined palaces of Rome. They introduce sculptured children and animals into their work, always with a right feeling of "propriety," the "to prepon," the really "becoming." The later Renaissance was the product of learned men who had analysed the huge temples and ruins of Italy and reduced them to rules; as academies of Art in our day manufacture artists by rules. Rules are good as tests required to measure and test the work of a painter or an architect, but they will not make either. *Poeta nascitur non fit.*

Inigo Jones, whose works were of the complete full blown classic kind, was himself an artist of great power. He was born in 1573, and, as some say, was apprenticed to a joiner. At an early age he travelled to Venice and other places, built a palace at Leghorn, and another for the King of Denmark, and brought sculpture and other works of Art for the Earls of Pembroke, Arundel, and Danvers. He flourished during the reigns of James I. and Charles I. His great design was for a new Royal Whitehall, the old palace of Wolsey having been burnt in 1618. All that was built by Jones was the banquetting house opposite the Horse Guards. More than one set of designs for the entire palace remain and have been engraved.

Jones became attached to the Court of James I., some time before 1610 as the inventor and contriver of masks, theatre scenery, and general designer for the Court. There is a King's Thames barge at South Kensington,

possibly of his design. He seems to have been a devoted admirer and follower of Palladio. All his Architecture is simple and massive. Wilton House, Salisbury; Ashburton House, Westminster; Brympton, Somerset (the front), and many other houses are existing examples. His woodwork is suited to the massive character of his exteriors. Some of his panelling has more design in it than that of Wren, who came after him. His inventiveness, as his Majesty's contriver, was of service to his woodwork. Shifting scenes, of which he had learned the art in Italy, are said to have been introduced into this country by him. His more important fireplace fronts were of marble, but a large number of them were of wood, the composition and ornamentation being similar in design to his marble ones. There are certain decorative features very frequently seen on these objects; for instance, groups of three long acanthus buds, looking rather like three fishes, which have seemed to me a sort of Jones signature, whether invented by him, or borrowed from Italy.

Another favourite moulding of Jones's is the square fret, and another the curve rolling over like the waves of the sea, called the Vitruvian roll, and another of his decorations in wood is the swag or hanging garland. We find this last on fireplace mouldings and at the flanks of picture frames where, in either instance, the angles break out, commonly called Vandyck frames, because often used for Vandyck portraits. Jones used Telamon figures, i.e., figures as members or apparent members of support, in his chimney fronts. This kind of carving became a fashion, sometimes facing the spectator, sometimes sideways in profile. Later architects, Kent and others, made use of these various decorative features in the woodwork of London houses. Examples from Wood Street, and the demolitions of Carey Street, &c., may be seen in the South Kensington Museum and in furniture shops.

Altogether it must be acknowledged that Jones, if he did much (as I think he did) to academicise Renaissance interiors as well as exteriors, he did it with a certain nobility, and that in the woodwork interest he stamped a lasting impression on his country.

Next to Jones we must rank Sir Christopher Wren, an admirable constructor, and not wanting in the capacity of decorative composition in his Architecture. He is said never to have travelled beyond the four seas, and that this fact was a professional disadvantage. I do not altogether admit that latter view. He might have lost as much as he would have gained by the variety of fashions he would have seen in Italy and France.

Wren's woodwork may be seen in the stall work of St. Paul's Cathedral and some collegiate chapels. There are details at South Kensington from the old stalls at Eton College. His stalls are covered by a continuous flat roof or shelf supported by brackets beautifully carved with a canthus in graceful rolls. His panelling in parish churches can be seen in London City churches. Many of them were rebuilt by Wren after the Great Fire.

For house interiors he may be well studied in Greenwich and Hampton Court. His panelling is on a large scale, a set of dado panels below, and of tall panels, 8ft., 9ft., or more, by about 3ft. The mouldings are large in proportion. At Hampton Court occasional swags of Grinling Gibbons's carving in lime-wood are introduced. These interior fittings are quiet, dignified, more "proper" than interesting. The windows of Hampton Court are of the Dutch kind, tall sash windows; useful, but wanting in any kind of decorative effect. Wren had many imitators. His Architecture, under other hands, devoid of the decorative capacities of Wren, has resulted in the duller of the streets and squares of Georgian London. Wren panels, staircase balustrades, &c., survive in hundreds of the houses built after his death.

Next we must notice Sir William Chambers, an architect of the middle of the century. He did travel in many countries, and brought back his Chinese notions, which he carried out in woodwork: Chinese summer-houses

HALL, AUDLEY END, ESSEX.

and garden trellises which he had carved among the ornament of woodwork, looking-glass frames, &c. His treatise on "Civil Architecture" is of value in so far as it is academic in character. It describes the details of classic woodwork ornamentation—dadoes, bases, wall divisions, and the different members of entablatures, with some explanation of the typical meaning of classic mouldings. His frets and trellises, of Chinese origin, are worth studying and remembering. There are rooms in old houses of 150 years ago prepared with

BRACKET FROM ETON COLLEGE.

the admirable wall-papers of the China of the days in which these borders of trellises and fretwork are effectively employed. Sir William built the present Somerset House. He found the old rooms part, of the dower house of Queen Henrietta Maria, furnished completely, just as she had left them.

The last master of internal woodwork decoration whom I will notice is Adam, or, rather, the two brothers, Robert and James, for they seem to have practised as partners. We are assembled this evening in one of their houses, built over what was once Durham Yard, part of the premises of the Bishop of Durham's London house. The Adam houses are all round us here. Certain features are observable on their exteriors—oval medallions, pilasters, covered with rolling scrolls in relief. Old Northumberland House at Charing Cross, now destroyed, Sion House, several Portland Place houses, Lansdowne House, and others, are or were good illustrations of Adam ornamentation in wood and plaster. His mouldings are delicate, sharply cut, somewhat wiry and dry and cramped when compared with the flowing lines of Wren's wood-carving; still, not without refinement and distinction. The Adams undertook the entire decoration of the houses they erected; and of the furniture suited to them. This may be seen in their published views of the interiors of Sion House, Derby House, and others. They seem to have employed Sheraton and his imitators largely for their furniture designs.

Here I will bring these remarks to a conclusion. I have noticed what I call the academic system of architectural decoration in wood as in stone.

Neither the figure carving nor the scroll work of these seventeenth century English carvers can compare with Italian sculpture, if we refer it to the work of the purest periods, or to that of famous artists. But famous artists are very rare creatures, and carvers who can do no more than copy and attain neatness and a smooth surface, may be in some sense correct, but racy or interesting never.

ROMAN REMAINS.

ANTIQUARIAN VISIT IN YORKSHIRE.

SEVERAL members of the Bradford Scientific Association recently paid a visit to Boroughbridge and Aldborough, places of considerable antiquity. Aldborough, as its name would indicate, boasts a very heavy history; its records dip deep into the Roman period. The first objects visited were the huge monoliths known as the "Devil's Arrows" at Boroughbridge. These remarkable obelisks appear to belong to that class of menhirs or pillar stones, sometimes called Druidical monuments, but of more ancient date than Druidism itself, similar erections being among the earliest known memorials of the primitive inhabitants of Western Europe. They are three in number, and range from 18ft. to 22½ft. in height above the surface of the ground, to which must be added from 5ft. to 7ft. of stone embedded beneath the soil.

THE PILLARS

are computed to weigh from thirty to thirty-six tons each. At one time there was a fourth stone, but it was hewn down, and a portion of it was used as the foundation of a neighbouring bridge. The remaining obelisks are all of the millstone-grit formation, which does not exist nearer than Plumpton Rocks, eleven miles distant, whence it is supposed these columns were procured. The Devil's Arrows surpass in magnitude the average of the stones at Stonehenge, Salisbury Plain, which were conveyed a distance of sixteen miles. The "arrows," however, are surpassed in height by the Rudston monolith—an isolated pillar standing in the churchyard at Rudston, in the East Riding, which measures 25ft. above ground. That stone has been traced for nearly 16ft. below the present surface, making a total height of 40ft. The party next went forward to Aldborough, about three quarters of a mile away. The origin of Aldborough is lost in antiquity. That it was a fortified place prior to the Roman occupation of Britain is certain, for it is so described by Ptolemy, who ascribes to it the distinction of being the

CHIEF CENTRE OF THE BRIGANTES,

who gave much trouble to the legionaries of Cæsar. Remains of the Brigantian rampart, discovered some years ago, contained numerous relics of the pre-historic age. The chief interest of Aldborough centres in its being the Isurium of the Romans, and probably the first Roman city laid out in Yorkshire. That it had precedence of York, the Eboracum of the Roman period, has been conceded, although the latter city subsequently became the northern metropolis of Roman Britain. Aldborough was also the point of junction of two main Roman roads, namely, those from York and Tadcaster, and a cross-country trackway from Ilkley, the Roman Olicana. Thus Roman remains in abundance might be naturally looked for at Aldborough, and some of these the visitors had pleasure in examining, as, for instance, the very remarkable mosaics of Roman handiwork. No English northern town is so rich in these unmistakable

EVIDENCES OF ROMAN ART,

civilisation, and prosperity as Aldborough. It far eclipses York, where only three or four mosaic pavements have been discovered, while on the site of Isurium the number discovered exceeds a score. The fact that those inspected remain in the position where they were originally designed lends them an additional charm. The museum of Roman remains is not extensive, but is very interesting as containing nothing but what has been unearthed in the locality. Of the ancient city wall of Isurium several detached portions have been opened out for inspection, but as the stones of which they were composed became the common quarry for generations of builders in the immediate locality, great gaps occur which are only traceable by the debris left by vandalism. The ground plan was of quadrangular form. The question from what quarry were these stones obtained has been a moot point with antiquaries, as there is no stone corresponding to them in the neighbourhood.

REMOVING A NOTABLE CHURCH.

SIDE by side in Great Ormond Street stand two very interesting hospitals, one for suffering children and the other for adults. For a long time it has been felt that both of these valuable institutions require enlargement; but the difficulty has been that one could only be enlarged at the expense of the other. This difficulty has, however, been at length settled by an arrangement between the two institutions: to the effect that the children's hospital should purchase the site of the Hospital of St. John and St. Elizabeth, the latter being re-erected upon ground secured in St. John's Wood. One of the obstacles which at first stood in the way of this very desirable arrangement was the costly and beautiful church attached to the hospital, but the architect consulted on the subject has shown that this can be taken down and transferred stone by stone to the new site. "The Hospital of St. John and St. Elizabeth," as it is generally called—or to speak more correctly, the Hospital of St. Elizabeth and the Church of St. John of Jerusalem—in Great Ormond Street was founded in 1862 by the late Cardinal Wiseman and Sir George Bowyer, M.P. The dedication of the church bears reference to the knightly "Order of St. John of Jerusalem," better known as the "Knights of Malta." These knights were a branch of the great order of the Knights Templars. The Church of St. John of Jerusalem was erected entirely at the cost of Sir George Bowyer—who was himself a Knight of Malta—from the designs of the late Mr. George Goldie. It is quite a gem of Italian Architecture, and some beautiful old objects of ancient Art of the Renaissance period, a magnificently carved tabernacle of tortoiseshell, and marble altars, add not a little to its interest. The building will be removed to the new site and rebuilt, but advantage will be taken by the present architect, Mr. Edward Goldie (son and representative of the first architect), of carrying out the sides of the building in stone in a similar style to the

AN OVERMANTEL AT HOUGHTON. DESIGNED BY INIGO JONES.

front, and of raising the dome upon a "drum" surrounded by a colonnade. A nun's choir will also be arranged, for which there was no sufficient space in the building as erected in Great Ormond Street. The hospital itself will be entirely new, for, as the old building was of brick, and insufficient in scale, it was not thought advisable to rebuild any portion of it except the church.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
June 8th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THERE is an exhibition of the antiquities found at Silchester at Burlington House. It includes objects in bronze, earthenware, iron, and bone. About five acres were excavated last year. The remains of many buildings were unearthed, including the foundations of a house of unusual size. A wooden tub, found at the bottom of a well, was in a complete state of preservation, save for one rotten stave. It measures 6ft. in height, and will be deposited in the Reading Museum. This year will probably bring to light many relics of the ancient Celto-Roman city. Two insulae are to be excavated, and a triangular piece of ground to the south of them.

A CORRESPONDENT sends us the following, taken from a young architect's letter from Italy, and his appreciations may be of interest to stay-at-home students:—"I am not disappointed in Venice, excepting that I cannot find so many picturesque incidents off the Grand Canal as I expected—the shabby walls of the decaying houses are not beautiful. I think the byeways of Belgium are almost more attractive, but the Grand Canal makes up for everything. I admire St. Mark's both inside and out, though at first the exterior greatly disappointed me, it seemed so dwarfed by the great tower. How one misses a broken skyline, the perpetual cornice and horizontality become monotonous at times. I look forward to some interesting days at Verona."

MR. HERBERT J. FINN once more occupies the Modern Gallery with his exhibition of pictures in the media of both oil and water-colour. In entering the running as an exponent of picturesque qualities in Architecture, Mr. Finn has probably done wisely; his pictures of Canterbury—the cathedral, cloisters, and gateways—form the staple part of the watercolour section, and among them is to be found the best work, from a technical point of view. Canterbury certainly lends itself well to pictorial representation, and the artist has been especially happy in his selection of subjects, as regards fine composition; in this essential his work cannot be too highly praised. Of the series that deals more or less with the cathedral, "The Crypt" is the most entirely satisfactory, being a finely rendered piece of difficult drawing, and full of delicate and harmonious colour.

In the other cathedral subjects, one feels that, although there is a grandeur inseparable from such subjects, they are dealt with rather too exclusively from the view-point of the architect, and hardly enough from that of the artist, who would fain create a picture, treating

the structures as important features, but in no sense sacrificing sky and general atmospheric effect to them. The knowledge of conventional greyness, too, seems often to limit artists who paint old buildings in their use of colour, and the rich variety resulting from, say, sunlight on rugged masonry, is rarely appreciated. Mr. Finn gets agreeable effects in his less-fettered river and landscape work; "The Medway, Maidstone," and more especially "Sunlit Barges off Margate," are charming sketches. "Cloud Shadows over the Sea," is a beautiful subject, but its carrying-out in the present instance is too tentative and timid to make it really impressive.

BEFORE the Metropolitan Tribunal of Appeal, composed of Mr. Arthur Cates (President), Mr. A. A. Hudson, and Mr. J. W. Penfold, and sitting at the Surveyors' Institution last week, an important case under the Building Act, and involving the rights of the London Council to refuse to sanction plans for the erection of buildings under certain conditions, came on for decision. The case was one in which Mr. Charles Gillett, a builder, of 190, Elmtree Road, Upper Holloway, was the appellant, and the London County Council were the respondents.—Mr. Wootten, for the appellant, in stating his case, said early in the present year Mr. Lawrence, as the architect to the appellant, submitted plans to the London County Council of two houses which it was proposed to erect in Hornsey Road. The houses were intended to be for the use of the working classes. On April 17th the Council refused to sanction the plans, but gave no definite reason for their refusal. It was held, for the appellant, that the plans were faultless.—Mr. Seager Berry, on behalf of the Council, said the crucial point was the allowance of feet in front and behind, because if the houses were started they could be built block after block, and the builder could shelter himself behind the fact that he had so many feet of open space in front and so many at the back. It opened up a vast field for irregular construction in London, and the Council, in consequence, refused to permit the possibility of it by interpreting what they thought would be the front and back, and not what the architect or builder thought in that respect. It was the intention of the Legislature to prevent that mode of construction.—The Tribunal, after a lengthy deliberation, dismissed the appeal, and made no order as to costs.—Mr. Wootten applied for a case to be stated for the High Courts, but the Tribunal reserved their decision as to whether their finding was based on points of law or matters of fact.

AN important addition to the fittings of the Church of St. Aidan, in the Roundhay Road, Leeds, was dedicated two or three days ago. A rood was a part of the original design, and, from the opening of the church, a heavy oaken beam across the entrance to the choir has indicated its position, and, in its bare and unfinished state, has been an undeniable eyesore. The rood has now been finished, at a cost of £300. The design is by Mr. Crawford Hick, the architect of the church; it has been very satisfactorily carried into execution by the carver, Mr. Hedley, of Newcastle. In the centre stands a large figure of the Saviour hanging on the Cross, flanked by figures of the Blessed Virgin and St. John the Evangelist. At the extremities of the supporting beam are kneeling figures of adoring angels, whose folded wings form a very striking and beautiful feature of the design. Along the front of the beam, displayed on a label, is the text: "I, if I be lifted up, will draw all men to me," from which, by a singular mischance, the first word has been omitted. The material is oak, and the carving is bold, vigorous, and spirited. The figure of the Virgin recalls the well-known Nuremberg Madonna, and is, like that famous work, dignified and refined. A certain touch of sentimentality seems almost inevitable in the treatment of St. John, and it is not altogether absent in this case. The central figure is quite worthy of its position, and the ornament applied to the cross gives exactly the right feeling of conventionality to the group. So many otherwise fine modern

churches are spoilt by insipid sculpture, that such strong and spirited work as this deserves recognition. What the rood, in common with the rest of the church, still wants, beyond all other things, is colour. The rood should be the central point in a well-considered and coherent scheme of colour, such as is even more requisite in a building of the Basilican type than in Gothic interiors. At present the new oak and plaster have a rawness of colour that is very detrimental to what promises to be one of the most notable church interiors in the district. We believe that the architect of the church has all along planned it with a view to the lavish but judicious use of colour, and make no doubt that its application to the rood is intended. Only it is necessary to point out that in its present condition it cannot be regarded as producing its fullest possible effect.

THE latest projected addition to London's travelling facilities is an electric railway from Piccadilly Circus to South Kensington. Parliamentary powers have been obtained to construct the line, which will be commenced shortly. The line will run straight down Piccadilly and the Brompton Road to the South Kensington Metropolitan Station. Sir James Szlumper is the engineer of the line, and the electrical arrangements will be under the supervision of Professor Kennedy, F.R.S.

THE Improvement Committee of the Hull City Corporation have adopted a scheme for recommendation to the Council for the Improvement of Great Passage Street. This thoroughfare is short and very narrow, and is situated in a very crowded district. The widening will have the effect of opening up considerably the present means of communication, and when the whole scheme is completed it will form the beginning of a thoroughfare two miles in extent, and running through many important streets of the city. The total expenditure to be incurred is estimated at £21,850.

THERE has been a great deal of talk lately about Art for Art's sake, which is the result of people looking so much for the story or meaning of a picture that they fail to see anything beyond. This became so objectionable to the artistic feeling of the modern artist that the consequence was that he wanted everything of the kind swept away—everything but the decorative qualities of the painting. Whistler, Alfred Stevens, Monet, and other well-known painters would have nothing but Art for Art's sake. We are told by Whistler that as music is the poetry of sound, so is Art the poetry of sight. But is not music something more than mere sound—does it not suggest feeling and meaning? Why do we become worked up and emotional over a beautiful oratorio? So there should be a meaning behind the most decorative of paintings. Should not every picture present some feeling, something behind the decorative quality? The lines, the lights, and all the objects should be arranged to convey some meaning, or if they are so indefinite that you cannot distinguish one thing from another, then it is not a picture; it is only a dash of colour which may be interesting to the eye simply as a colour spot.

WHISTLER may call one of his small panels of the sea and sky a symphony in blue and gray, but with a few lines he does put meaning into the colour. So you see, says the Art Interchange, the picture cannot succeed very well without a subject. But painting is not a mere vehicle for all history, nor should it be only used for decoration. The decorative place is quite as important as the illustrative; but is there any reason why both should not be important? These are simply two kinds of Art, but it seems that there are four kinds of Art which help to make a perfect picture. Whether decorative or illustrative Art came first, we can only conjecture. A painter draws a few lines that suggests a bear. Why does he do this? Is it not that the artist desires to convey some thought, to say something about the bear? It is useless to say this is not Art. We believe it is Art. We meet the

same kind of thing in Egypt, where all the decorations were illustrative of Egyptian life. The subject was perpetually in evidence throughout the decorative motive. It was the only way the Egyptians had of recording their history. What about the great Art of the Italian Renaissance? Was not the theme used by the artists of importance? Almost everything was illustrative of some sacred story.

THE interior of the picturesque village church dedicated to the Holy Trinity at Down Ampney has been furnished with some notable examples of modern ecclesiastical Art. The rood-screen is, as are also the whole of the additions, the design of Mr. Charles E. Ponting, of Marlborough. It is of beautiful workmanship, conceived in a free fifteenth century style of Gothic Architecture, graceful in detail, although massive in construction. The screen has been erected immediately beneath the chancel arch, and now marks the line of demarcation between the nave and chancel. It consists of three distinct bays on either side of the doorway. These are well carried up aloft, and have their lower panels filled with crisply cut tracery. Each bay has an ogee head with carved crockets of sacred design, terminating with *fleur-de-lis*, and surrounded by a wealth of pierced tracery with cusps of charmingly carved cupids' heads. From moulded caps spring the finely traceried groining which runs the whole length of the screen both on eastern and western sides. Between each bay are ornamented springers, finishing with sculptured heads. Above the groining an inverted cresting marks the commencement of the main cornice, and upon the latter there are delicately carved symbolical ornaments, interspersed by carved angels in devotional attitudes, surmounted by a pierced cresting of rich design, through which run buttressed pinnacles, supported by angels holding shields whereon are carved emblems of the Passion.

ABOVE the whole rises a strikingly-designed rood cross, containing a wealth of carving, tracery, and sculpture in relief. On the eastern side of the screen much carved work is introduced, and in the intersections of the groining are some foliated bosses, in which the sacred emblems of the Passion have been introduced. The screen has been made entirely of oak, and is, perhaps, one of the finest that has been erected in modern times. The reredos is also an interesting work of art. It is fixed upon a re-table of Hopton Wood marble, the mensa of the altar also being of the same material. The reredos proper is composed of oak. The central panel consists of a representation of Our Lord crucified, with the Blessed Virgin and St. John standing at the foot of the cross, all in high relief. In quaintly conceived niches at the sides are a quartette of angels carved in the round, the whole surmounted by a bold and intricately carved canopy, with much delicate pierced work, and pinnacled terminatory shafts. The north side of the reredos is occupied by carved figures of the four great Virgins of the Latin Church, viz., St. Cecilia, who is shown with the organ as her emblem; St. Agnes, with the lamb; St. Agatha holds the shears; and St. Lucia bears aloft a lamp and carries a palm. In the south compartment are the four Latin Fathers, St. Jerome being habited in the hat and robes of a cardinal, bearing a church in his hand; St. Ambrose wears the episcopal robes as Bishop of Milan, with mitre and crozier, and bears a knotted scourge; St. Augustine is also habited as a bishop, and carries a book; and St. Gregory is in pontifical robes, with a dove hovering around his head. All this sculpture, like the crucifixion, is intensified by a background of gilded diaper work. The supports of the reredos are composed of gesso panels of gold ornament. The whole of the sanctuary has been laid with marble, and all harmonises with excellent effect. The church has been seated throughout in oak, as also have the side chapels. The south chapel has been enclosed with screens, the altar foot pace laid with many coloured marbles, and the old tombs restored.

THE opening of the great tower at New Brighton took place a few days ago. This mighty structure has been in process of erection nearly two years, and no less than £300,000 have been spent on the undertaking. The tower is 500ft. above the level of the sea. In the lower portions of the edifice are a theatre capable of seating 3000 persons, a very large ball-room, a winter garden, restaurants, cafés, and shops. From the elevator hall run four electric lifts capable of carrying 2000 persons within the hour to the upper platform of the tower.

A BEAUTIFUL chancel screen is in course of erection at St. Werburgh's Church, Derby. St. Werburgh's is a spacious modern edifice that has replaced an old fabric of no architectural interest or pretensions, although of ancient foundation, for St. Werburgh's was one of the six Derby churches mentioned by the Domesday Book as extant in the time of Edward the Confessor, and again in the reign of William the Conqueror.

ARCHITECTURAL opportunities—occasionally golden ones—arise not infrequently in our large towns, but it would be difficult to point to one which has been seized to better effect than the laying out of the triangular piece of ground styled "City Square," Leeds. Whatever may be the ultimate criticism upon the design, either as a whole or in its parts, it will (says the Yorkshire Post) be next door to unique in its coherence and unity. An important feature is to be a series of statues of men who by their lives or works have influenced the history of the town and district. Mr. H. C. Fehr, the designer of the fine coloured reliefs in the Wakefield County Hall, has modelled a statuette of Watt, whose invention of the steam engine has so materially helped to make Leeds what it is to-day, while Mr. Drury is the author of a figure of Priestley, who, as "the father of pneumatic chemistry," deserves to be classed as one of the most distinguished of the not very long list of natives famous beyond their parishes. Both are excellent pieces of workmanship, refined and dignified, yet full of vitality. Priestley's figure is in particular remarkable for a serenity that is most happy in a work intended to be of monumental character and proportions. The only adverse criticism, and that a sufficiently obvious one when the figures are placed together, is that there is too much similarity in pose and gesture, a coincidence which might have been avoided, one would think, by a little collaboration on the part of the artists, and which will no doubt be corrected in the finished works.

MR. DRURY's design for the candelabra to be placed at the entrance to the lavatories is necessarily not more than a suggestion, owing to the small scale employed. The figures at the base are charming, and the introduction of the Leeds owls is most happy, but the upper part seems, so far as it is competent to judge at present, rather wanting in character and distinction as compared with the important base. Still, like all Mr. Drury's work, it has genuine artistic feeling in every line. John Harrison, the loyal benefactor of his native town, who endowed it with one of the most interesting of its public buildings, is worthily, if tardily, to be accorded a public monument in this gallery of local celebrities, and it may, perhaps, be suggested that a fitting pendant to him would be another church builder—in a still wider sense—Dr. Hook, the "great Vicar of Leeds," who raised so high a standard for the parish priest of the nineteenth century. From the purely artistic standpoint, his rugged face, so full of character, would furnish a delightful subject, while his decanal gaiters would banish the sculptor's bugbear—the prosaic trousers of nineteenth century costume.

MR. G. A. T. MIDDLETON says, in a letter to the Times: "The verdict of manslaughter against the architect returned by the coroner's jury in the case of the Abbey Mansions disaster raises a point of most serious public interest, for it amounts to a declaration of want of skill

or knowledge upon his part, and the question arises as to how large a proportion of architects are fully competent to protect the lives of the public using their buildings. Anyone may pose and practise as an architect. There is no compulsory training, no compulsory examination, and the only voluntary examinations, those of the Royal Institute of British Architects, are deplorably weak on the scientific side—weak to the extent of danger. Some few thoughtful men long since recognised this, and promoted a Bill which would place architects, in the matter of training and examination, upon the same footing as doctors and lawyers. Is there no member in the House who at this moment, when public attention is drawn to its importance, will take the matter up, and not rest until the Bill becomes law?"

BIRMINGHAM is just now in the throes of a great controversy over the future of its tramways. The Canadian company who recently obtained a lease of the tramways are fighting for permission to adopt overhead electric traction. The Corporation hitherto have stuck stoutly to the underground conduit system; but the company have just obtained a slight advantage by inducing the Public Works Committee to sanction the adoption of the overhead system upon a short route of 5½ miles by way of experiment.

NEAR where Queen Victoria Street, Cheap-side, Cornhill, Threadneedle Street, Princes Street, Lombard Street, and King William Street converge, there is now in course of construction, in connection with the Central London Electric Railway, a subway which will enable foot passengers to get from any one point to another, without imperilling life and limb. There will be several flights of steps from the subway communicating with the chief thoroughfares, and, as the subway is only a few feet below the roadway, it can be easily reached by a few steps.

IN excavating a large rectangular cellar in connection with the new Congregational Church and Schoolrooms at Morpeth, the workmen came upon a huge boulder of whinstone lying right in the middle of the space. It was oblong in shape, and its upper surface was little more than 2ft. below the ground level. When the gravel had been taken out to the required depths, it was found that the part of the boulder still embedded was greater than the portion exposed. As blasting would have been a dangerous operation in such a situation, and no ordinary appliances were equal to lifting such a block, recourse was had to a very primitive mode of splitting the unwieldy stone. A fire was kindled on and around it, and the unequal expansion of the part exposed and the part still sunk in the ground, caused the bared and heated portion to split off, leaving the remainder *in situ*, at a level that would not interfere with the design of the boiler house. The same excavation exposed another boulder. It was very much smaller, and was of limestone. The distance between the two was less than 1yd. The surfaces of both were smooth. It was estimated that the limestone boulder weighed between two and three tons, and the whinstone one not less than twelve tons. They are fresh evidences of the greatness of the natural forces in operation during the glacial period, when such heavy masses were carried long distances, ground, rolled, and rounded, and finally deposited far from the elevated rocks of which they were fragments.

A SMALL but interesting collection of works by members of the Society of Mezzotint Engravers is being exhibited at Messrs. Grundy and Smith's galleries. The rise of the society is in itself a welcome sign that mezzotint engraving is regaining its old popularity in this country with both artists and the public. The revival is no doubt partly due to the invention of the process for facing the engraved copper plate with a thin layer of steel, so that it will wear better and give a larger number of brilliant impressions. A more potent cause, however, is the ability of many of the artists

who have devoted themselves of late years to mezzotint. Professor Herkomer, for one, has done a great deal for the art, and so have several members of this society, notably Mr. Wehrschmidt, Mr. Gerald Robinson, and Mr. Finnie. Most of the works now exhibited are reproductions of well-known pictures that show how faithfully mezzotint can render the effect of paint, and do not necessarily illustrate the special beauties of this kind of engraving.

ARTISTIC objects, valued at £6000, were recently stolen from the rare collections of the Union Centrale des Arts Decoratifs, which, since the demolition of the wings of the Palais d'Industrie, have been stored in the Pavillon de Marsan of the Louvre. The collections are estimated as worth £80,000, and were safely packed in cases, some of which were found broken a few days since, and on further investigation it was seen that numerous articles, including a court mantle of the thirteenth century, several antique saddle-cloths, rare old lace tapestry dalmatics, and other ecclesiastical vestments, collected from various countries were missing. The detectives who were set to work visited the old curiosity shops of Paris, and recovered some of the stolen articles, at the same time ascertaining from the dealers the names of the persons who sold them the antiquities. This led to the arrest of three men, and notably of one Caron, in whose rooms many of the purloined curiosities were discovered. He had placed some of the choicest Gobelins and Beauvais work on the walls of his bedroom, while an altar-cover of the sixteenth century ornamented his mantelpiece, and on his table was a saddle-cloth which had belonged to Marshal de Villars, the famous French war leader.

THE restored church of St. Helen's, Austerfield, has just been opened. The church was built about 1130, and with the exception of the window, the rebuilding of the north aisle, and the addition of the porch, the original Norman structure remains intact. Prior to the recent restoration, the church presented some of the worst features of church desecration—the walls, both inside and out, were coated with plaster and colourwash. In 1835 the fine old roof and oak seating were destroyed and replaced by a common barn roof and plaster ceiling, high box pews, and an unsightly gallery. All these eyesores have been removed. A fine oak roof has been placed on the building, and decent seating accommodation has been provided. It was discovered that the north wall concealed a beautiful Norman arcade. This has now been opened out, and a new north aisle built on the site of a former aisle. The architect for the restoration has been Mr. C. Hodgson Fowler, of Durham, under whom the work has been carried out by Messrs. Bowman and Sons, of Stamford, at an estimated cost of £2000. In addition to this work, seven stained glass windows have been inserted.

THE sub-committee charged with the responsibility of recommending a site to the West Riding County Council for the erection of another lunatic asylum in its administrative area met the other day at Wakefield. Several estates more or less suitable were mentioned. Among these were Crow Nest, near to Lightcliffe Station, on the Lancashire and Yorkshire Railway, and formerly the residence of Sir Titus Salt; Fixby Hall, three miles from Huddersfield; Coley Hall, near Lightcliffe; and Stortheres Hall, Kirkburton. Two of the estates—Crow Nest and Fixby Hall—were inspected weeks ago, and were regarded as possible sites. Since then, however, some members of the committee have visited Stortheres Hall, and they look upon it as the most favourable place for the erection of an asylum to serve the populous districts in the Calder Valley. No definite decision has yet been arrived at.

MR. JOHN STARFORTH, architect, of Edinburgh, died a few days ago. The deceased, who was seventy-five years of age, was born in Durham, and was educated at the University

of his native city. Coming to Edinburgh as a youth, he entered the office of Burn and Bryce, architects, and served his apprenticeship there. Subsequently he began business on his own account, and during his long professional career he enjoyed a large share of public favour. He became a recognised authority on English Gothic; and in many of the churches which he designed the influence of the graceful architecture of Durham Cathedral, which had impressed itself upon him as a lad, made itself felt. Among other buildings of importance with which his name is associated as architect are Dumfries and Galloway Royal Infirmary, Greenock Asylum and Poorhouse, Berwick Infirmary, Peebles Hydropathic, John Knox Memorial Institute, Eyre Place Church, London Road Church, Bonnington United Presbyterian Church, Moffat Parish Church, the first Kelso United Presbyterian Church, Nairn Parish Church, Holy Trinity Church, and Galashiels Free Church. He was in his day a noted church builder, and the many ecclesiastical edifices in all parts of the country which he designed are a credit to his artistic ability and taste. In a national competition for the Edinburgh Prince Consort Memorial his design received the first place, but it was afterwards abandoned for the present equestrian statue of the Prince in Charlotte Square. Mr. Starforth also gained the gold medal of the Highland and Agricultural Society for the best design for farm buildings. He was entrusted with the erection of many mansion-houses in the Highlands and West of Scotland.

THE artistic world at the commencement of the nineteenth century, as far as Sculpture and Architecture were concerned, was animated, says the Art Journal, by a marked endeavour at a closer approximation in style to the chaste severity of pure Greek Art. Extended exploration and the advanced enlightenment of antiquarian research had produced a feeling of dissatisfaction with what had hitherto passed as respectable in the classic style. The good old useful Palladian Architecture was no longer in vogue. In sculpture the reign of the gods and goddesses, nymphs and fauns, and Roman Emperors of the periwig period was over. It can scarcely be wondered at, for the Greek craze was rampant everywhere, the very dandies were then styled "Corinthians," and the "girl of the period" emulated in her dress the scant simplicity of the Greek chiton. In those days the Antique School of the Royal Academy, at present so much despised, was in the very zenith of its glory; Fuseli, its enthusiastic keeper, shouting to the students, "The Greeks vere Gods! the Greeks vere Gods!" On this great wave of classic revivalism, Sir Robert Smirke and Sir Richard Westmacott, twin brethren Academicians, with steady hands and unimpassioned hearts, without encountering let or hindrance of any sort, steered their respective courses to honours and success, whilst others less fortunate, like Haydon, were dashed to pieces on the rocks of overweening ambition, or, like the modest Flaxman, left stranded on the cold mud-flats of neglect. Sir Robert and Sir Richard both possessed the happy knack of exactly satisfying the popular taste. Every building that was entrusted to Smirke for execution, whether theatre, post office, church, or museum, was sure to possess the required amount of classic simplicity and dignity, the Ionic portico and pediment generally forming the most important feature in the design; whilst in all the monumental figures from the hand of Westmacott that haunt our public squares, churches, and cathedrals, we plainly perceive a more or less successful amalgamation of the modern gentleman with the hero of antiquity, a result greatly due to the skill bestowed on the heavy draperies with which they are clothed, which draperies, besides giving a classic aspect to the figures, ingeniously help to support them on their pedestals.

THE Building Committee of the Glasgow International Exhibition, 1901, has resolved to recommend to the Executive Council that the following professional members of the

Building Committee, together with the Convenor and Vice-Convenor, be appointed a sub-committee to examine the competitive plans when received and to report: Messrs. J. J. Burnet, A.R.S.A., William Leiper, R.S.A., A. B. McDonald, E. W. F. Salmon, James Thompson, and Robert Whitson.

A NUMBER of interesting frescoes which have been warehoused for some time will be put up to auction by Messrs. Foster in Pall-mall to-day (Wednesday). The frescoes were previously discovered in an English cellar, but this portion of their history is enshrouded in mystery. They are alleged to have been removed from the walls of the oratory of the oldest church in Milan, on which they are said to have been painted 400 years ago by Bernardino Luini. The account given of the manner in which they were removed from the church walls is ingenious. It is said that the face of the frescoes must have been covered with paper, and the wall behind them knocked away piece by piece with the exception of half an inch of plaster. Canvas was then pasted upon the back. It was not stated that the church was absolutely reduced to ruins by this process, but it sounds likely.

IMPROBABLE as this story seems, the pictures have attracted a great deal of interest both in London and on the Continent, and it is quite possible that the National Gallery and some of the foreign galleries may be represented at the sale. The subjects of the frescoes appear to be remarkable. The catalogue says that one of them shows a number of half-length figures, each face being deeply impressed with devotional sentiment. "Lot 2" is a continuation of the same. It will be interesting to discover on Wednesday what the continuation of a face impressed with devotional sentiment is like. Connoisseurs will also have the opportunity of acquiring a 40-in. high fragment of Roman soldiers. The description of the frescoes states that they comprise a grand altar-piece, the Last Supper, two wings of life-sized figures in ecstasy, four large panels, the Ascension of Christ, the Virgin enthroned, the agony in the garden, and the hall of Caiaphas; the ceiling in five panels, the lamb, angels, and winged beasts.

LORD EUSTACE CECIL, brother of Lord Salisbury, has erected at his sole expense a beautiful and substantial church at Lytchett Minster, Dorset, where he resides. The building is erected in the Early English style, and, with its bold tower is of graceful design, and presents a most agreeable appearance. The internal fittings are of oak, and there is a handsome front of Caen stone with Purbeck shaft.

ANOTHER collapse of a building took place in London last Thursday, though happily neither on so large a scale nor with so appalling a loss of life as in the recent calamity in Victoria Street. The building was in course of construction on the foundations of a public-house lately pulled down in Devonshire Street, Portland Place, a street which runs parallel to Cavendish Street, and is only a short distance away from High Street, Marylebone. There is, or there was, on the north side of the street, a block of two houses between the Devonshire Place Mews and Beaumont Street. One of these houses is still standing, the other had been pulled down to the level of the street, and was being built up again over its former cellaring, which appears to be extensive. On Thursday the portion of the wall which had been built up on the Mews side of the public-house fell with a crash, burying one workman in the ruins and throwing another down. The first workman was killed, and the second injured. The contractors and the builder, who were on the spot, were anxious to give every information; one of them remarked that in his opinion the wall had fallen because the arch of the cellar upon which it was built was too wide, and therefore too weak to support the weight. There is not very much to see, for the amount of wall that has fallen is very slight, but the girders have all been thrown down, and what was a wall is now a rubbish heap.

FOUNDATIONS *

AS APPLIED TO LONDON BUILDINGS
AND RIVERSIDE FOUNDATIONS.

By A. T. WALMISLEY.

(Continued from page 309.)

THE City and Southwark Subway, now used as an electric railway, in its course between the Middlesex side of the river and the Monument Terminus, passed up Swan Lane near some heavy warehouses tenanted by Messrs. Harker and Co., 102 and 103, Upper Thames Street, spice merchants; Messrs. Walker and Co., Old Swan Lane, packers; Messrs. Davies and Royle, 3, Old Swan Lane, wholesale stationers; Messrs. Wigan and Co., 2, Swan Lane, importers of isinglass. Near the latter warehouse, immediately adjoining the route of the subway, the tunnel left the clay and entered

THE WATER-BEARING STRATA.

These warehouses have basement, ground floor, first floor, second floor, and top floor space, all busily occupied, some rooms being used for heavy papers, others for cases containing various kinds of fruit and general heavy goods. When the subway works were commenced, various old cracks were found to have existed in these buildings, which gave rise to the apprehension that some danger might occur in the construction of the new tunnels, or by the subsequent working of the railway, so that certain marks were noted, and pieces of paper were pasted over various old cracks, and in other cracks cement-filling was put in, levels of doors and sills taken, and the buildings plumbed both in and out near the angles. This was in the year 1887, before the construction of the tunnel commenced. At Messrs. Wigan's they had an engine (ten-horse-power) constantly at work upon the ground floor, which would have run irregularly in the event of settlement. Swan Lane is about 13ft. 6in. wide, and the tunnels are there placed one over the other. Compressed air behind a bulkhead was employed to restrain the advent or inflow of water into the space excavated, and no settlement of the upper surface resulted, the water-bearing strata being never without support.

THE VALUE OF THE GREATHEAD SYSTEM

of working enables a running strata to be broken into without danger. Where buildings and wharfs are situated on the side of a river unsecured, and where the materials of its bed are not sufficiently firm to allow a shelf being maintained between the buildings and the low water line, the shore may run down and carry the foundation of the buildings along with it. An instance of sand thus running occurred in 1837, during the progress of the Thames Tunnel, notwithstanding the close protection afforded in the shield used by the late Sir Isambard Brunel, the sand running in to such an extent that, at a distance of 50ft. east of the shield, the bed of the river sunk 13ft., bringing the river within less than 3ft. of the level of the excavation, while immediately above very little depression took place. A similar instance of running gravel is recorded when the shield approached the wharf on the Middlesex side, producing a conical depression 30ft. in diameter and 13ft. deep on the shore, followed by a subsidence of the wharf front. In the construction of the Blackwall Tunnel the use of the Greathead shield enabled the work to be successfully accomplished. In the construction of the Metropolitan District Railway between Westminster Abbey and Westminster Hospital the soil was sand and gravel, heavily charged with water, Westminster Abbey itself being on the sand. The nearest point of the works to the main walls of the Hospital was 23ft., and to Westminster Abbey 70ft. 8in. The tunnel was made without the slightest settlement of adjacent buildings, notwithstanding the fact that in wet sand and gravel pumping was carefully resorted to, in order practically to dry the ground sufficiently for work. By the aid of

iron tubing and the use of compressed air with the Greathead shield, as adopted in the City and South London Railway work, we need experience no anxiety. You can work as safely

IN GRAVEL CHARGED WITH WATER

as you can in London clay. The ordinary timbering of a tunnel is a yielding material, so that, unless special precautions are observed, there is a risk for the framework to yield which is employed to temporarily hold up the excavation before the brickwork is put in; but with an iron lining and cement grouting outside there is no need of alarm. The danger connected with pumping is obviated when it is carefully done. If it is carelessly done you may draw some of the finer particles of sand and water, and so undermine the foundations of an adjacent building to a greater or less extent. Where any accidents occurred on the construction of the City and Southwark Railway it was near the brick stations, where wood centres were introduced, but by adopting cast-iron lined shafts to the stations with cement grouting outside, any danger to surrounding property is avoided.

ON THE METROPOLITAN RAILWAY

ordinary stock bricks in blue lias lime were used. In the Metropolitan Railway settlements occurred, as it was constructed mainly without an invert. The ultimate improvement was to put an invert, which, of course, gave greater support from the pressure of the sides. The system of construction was in some cases tunnel, near Kensington, for instance, but generally cut and cover. With the use of the Greathead shield upon the Central London Railway, where not in the clay, compressed air is introduced, and the work is entirely in tunnel. The iron plates are properly jointed throughout. In the King's Road Bridge over the Regent's Canal, Camden Town—designed by Messrs. Thomas and Taylor—the foundations were sunk 22ft. below the roadway level, or 11ft. 6in. below the water level in the canal and 5ft. 6in. below the bed of the canal. The soil from the top of roadway to a depth of 18ft. was found to be of a clayey character, below which was found a seam of clay-stones 1ft. deep, and then clay suitable for a foundation. A trench 50ft. long was made, in which a concrete bed 8ft. 6in. square in section was built, with counterforts added at every 12ft. It was found that this ground could be timbered by experienced men without driving piles, and without pumping beyond the removal of a small amount of soakage while the men are not at work.

OLD WESTMINSTER BRIDGE,

which was built between the years 1738 and 1750, consisted of thirteen principal and two smaller arches nearest the abutments, 25ft. span, all semi-circular, springing from the piers at about 2ft. above the level of low water. The central arch was 76ft. span, but the principal lateral arches decreased in width by intervals of 4ft. each, and their intervening piers were supported by caissons consisting of rafts of timbers floated into position and then sunk in place, a level area having been previously dredged to receive them. Each raft was about 80ft. by 30ft. by 10ft. deep, made watertight all round, within which a portion of the pier was built, and the raft was then floated to the site of the proposed pier, the water admitted by sluices in the sides, and the foundation guided to its proper bed by ropes from a light barge previously moored off the shore. None of the foundations, which all rested on a substratum of sand and gravel, were at a greater depth than 14ft. below the bed of the river, and parts were not more than 5ft. or 6ft. The wooden platforms carrying the base of each pier thus ran the risk of settling upon an irregular foundation, and gradually getting undermined as the bed of the river lowers. Originally the piers were intended for a light wooden structure, but when it was determined that the bridge should be built of Portland stone, a stone casing was built around them. The bed of the river on which the caissons rested became undermined, particularly when, in later years, the tidal current, since the removal of the numerous piers of old London Bridge, ran off

with greater rapidity than when old Westminster Bridge was erected, and produced a general, though not uniform, lowering of the level of the river bed. A similar plan was, however, followed in the case of

OLD BLACKFRIARS BRIDGE,

built 1760 to 1770, the platforms here employed being 88ft. by 37ft., and two balks and a half thick, but in this structure bearing piles were introduced to obviate the liability to settlement. This bridge consisted of nine arches, elliptical in shape, constructed in Portland stone. The centre arch was 100ft. span, and the side spans decreased gradually to 98ft., 93ft., 83ft., and 70ft. Waterloo Bridge, built in 1811 to 1817, contains nine equal semi-elliptical arches of 120ft. span, and was the first bridge on the river in which coffer-dams were employed. These consisted of double piling, with puddle between, and did their work successfully during construction. Like old Westminster and Blackfriars Bridges, however, the foundations of Waterloo Bridge were left upon sand and gravel, and not carried down to the clay. Each pier was, however, built upon piles, there being one pile to every square yard of bearing surface. The heads of these piles were sawn off, and timber sills or bearing piles and waling pieces fastened on both transversely and longitudinally, upon which a flooring of 6in. planks were fixed, and then the first course of masonry laid thereon. The system of

LAYING THE FOUNDATIONS DRY IN COFFER-DAMS

was followed in Southwark Bridge, and the same plan adopted at new London Bridge, the former built 1814-1819, and the latter 1823-1831. In old London Bridge the piers were built on platforms supported on elm piles, driven into the bed of the river and cut off at low water level. In new London Bridge the foundation consists of timber piles 12in to 14in. square, shod with wrought-iron shoes weighing 35lb. each, and hoops 30lb. each, driven at intervals of 3ft. 6in. to 4ft. centre to centre, so that 16 square feet of masonry are taken by each pile. The bearing piles are here driven into the London clay about 18ft. below the platforms. The importance of establishing a foundation to resist undermining action cannot be overrated. Uniform width in a river produces uniform scour, which, while it creates a better channel for the discharge of flood water, also attacks any impediments it encounters. Since the

CONSTRUCTION OF THE THAMES EMBANKMENT,

the bed of the river parallel to the embankment has varied considerably. In new Westminster Bridge, completed in 1862, the foundation of each pier is entirely piled over with 145 elm piles, driven centre to centre, 3ft. 3in., and 2ft. 6in., passing through the gravel into the London clay, and cut off below low water. To avoid the expense of permanent coffer-dams, these piles were surrounded with iron piles connected by cast-iron plates, driven between them, known as "plate-piles," so as to form a complete casing, the interstices between all the piles being filled in with concrete. They go about 10ft. into the blue clay, and extend about a foot above the gravel bed. Upon these is placed a series of slabs of granite edgways, the plate piles being secured by two sets of ranges of iron ties, passing through the pier, and fixed by divers, the granite slabs secured both by the masonry of the pier and by the main piles to which the plate piles are connected. A complete caisson is thus formed, which has caused the necessity of the interior piles to be much questioned.

IN NEW BLACKFRIARS BRIDGE,

built 1864-69, wrought-iron caissons were employed for the foundation. Each pier stands upon four independent rectangular caissons, 36ft. by 18ft., carrying the centre of the pier, and two triangular caissons projecting beyond, to carry the cutwaters. These caissons were built upon a stage, and lowered by the aid of guide piles, into their assigned position, with their cutting edge resting on the bed of the river. The ground enclosed in each caisson was then excavated by divers, and the caissons sunk by being weighted with iron kentledge

* A paper read before the Architectural Association on May 20, 1898.

until the clay was reached, when leakage ceased, and the caisson by protracted loading took its final bearings at an approved depth of excavation. A material like the London clay is for all practical purposes incompressible, especially when prevented from spreading laterally, and deep down, so as to be unaffected by heat or damp. The caissons were then filled with concrete in cement, upon which was placed 8ft. of brickwork in cement, the top of which was at a level of 4ft. below low-water mark. A space of 1yd. was left between the caisson sections, which was subsequently filled with concrete in cement up to the same level, so as to provide an uninterrupted area over the base upon which each pier now stands, and the movable portion of the caissons above 4ft. below low-water level were removed as the work proceeded.

CYLINDER FOUNDATIONS

were first used by the late Sir W. Cubitt, at Rochester, and their employment has since been efficiently tested to show their adaptability for foundations. They were adopted for the original railway bridge at Blackfriars, 18ft. diameter, below the stone piers. Cylinder foundations, 18ft. diameter below, and 12ft. diameter above the bottom of the river are used for the piers of the Cannon Street railway bridge. At Charing Cross the cylinders are 14ft. diameter below and 10ft. diameter above the ground. The foundation cylinders of the Albert Bridge at Chelsea are 21ft. diameter, and their mode of fixture is described by the author in the discussion which took place on Mr. Crutwell's paper at the Institution of Civil Engineers, in which the foundations of the new railway bridge across the Thames at Blackfriars were described, and for which rectangular caissons, sunk 16ft. to 23ft. below the river bed, were adopted (see Min., Inst.C.E., vol. ci.).

THE VICTORIA RAILWAY BRIDGE

over the river at Battersea was originally constructed with piers on the up-river side standing on a bed of cement concrete enclosed by permanent sheet piles driven to a depth of 5ft. below the lowest foundation level, but when widened, the increased width of foundation was obtained by sinking permanent cast-iron cylinders to a depth of 45ft. below Trinity high water on the down-river side, four to each pier, 21ft. internal diameter, and 24ft. long, cast in segments 8ft. in length, with flanges for bolting together. These cylinders are filled with cement concrete for a depth of 12ft., upon which was laid brickwork in cement up to low-water level, above which level temporary wrought-iron cylinders were employed. The foundation cylinders were united at the top by a framework of cast-iron, but the masonry between the cylinders is principally carried by brick arches in cement turned between the cylinders in the hearting of the piers, which from this level to the springing line consist of solid brickwork in cement faced with masonry, so as to present the appearance below water of a continuous pier. In the

FOUNDATIONS FOR DESTROYER CELLS

and chimney shaft designed by Mr. J. W. Cockrill, a member of this Association, for the borough of Great Yarmouth, concrete blocks were employed, built in brickwork cylinders, and the maximum pressure per square foot on the subsoil was calculated to be 4 ton 63cwt. The ground is of a very marshy character, overlying sand and coarse gravel, into which the foundation is sunk. The cylinders are constructed of 9in. brickwork, built in Portland cement, the lower 4ft. being encased in a wooden drum, with cutting edge sunk into the gravel and sand at least 2ft. The cylinders are sunk by the aid of a grab, the bottom being levelled, and the concrete blocks laid by a diver. In this way the risk involved by pumping, which might disturb the foundations of cylinders already in their places, would be avoided. The blocks are grouted through a 3in. pipe with liquid cement, the joints and lewis holes having been previously filled with coarse, clean shingle. After about four days to permit the grout setting, and thus forming a watertight bottom, the cylinders are pumped out and filled with concrete composed of six

parts shingle, one part sand, and one part Portland cement. The remainder of the buildings, which are low, and light in weight, have

CONCRETE FOUNDATIONS TIED WITH IRON JOISTS

and spread to such a width that the sub-soil shall not receive a greater weight than half a ton per foot superficial, which, it has been ascertained by experiment, can be carried on this soil after the upper layer of turf and roots has been removed. In Drewry's "Suspension Bridges," published in 1832, we find the following allusion to foundations:—"A good plan for foundations, when the ground is loose and sandy, is to build upon wells, in the way practised in Madras for the public buildings. These wells are made circular, about 3ft. diameter, and one brick thick. The first course is laid and cemented together on the surface of the ground; when it is dry, the earth is excavated inside and round about it to allow it to sink. Then another is laid over it and again sunk. The well is thus built downwards, sinking the brickwork bodily to a depth of 10ft. or more, according to the building to be erected upon it, and the interior is filled up with rubble work. All the public buildings at Madras were erected upon foundations of this kind, which are found to answer very well." The Dover Electricity Supply Company erected works adjacent to the River Dour, from which the town is named. These works included a chimney, designed by Mr. F. G. Knight, of Westminster, about 130ft. high, with a concrete base 24ft. 3in. square by 5ft. deep.

THE RIVER TYNE AT NEWCASTLE

affords instructive examples of riverside foundations. The old quay walls, with a depth alongside at low water varying in the year 1840 from 2½ft. to 5½ft., had a piled foundation, and when in 1866 deeper quays were deemed essential, 12ft. of water at low tide was considered ample, which was subsequently increased to 22ft. Piled foundations were adhered to, until, upon the advice of the late Mr. T. E. Harrison, Engineer to the North-Eastern Railway Company, cast-iron cylinders sunk under atmospheric pressure for the sub-structure of the quay were adopted for new work, as cheaper than piled work. Two rows of cylinders were employed, each 5ft. diameter, placed 25ft. centre to centre longitudinally, the front and back cylinders being surmounted by cast-iron beams, from which masonry and brick arches were turned. Longitudinal metal sheet piling, up to the level of low water, was driven in the form of a segment between the front cylinders, but proved too weak for the increased depth of water after the bed of the river had been dredged out. The intervening sheet piling was done away with, and a more continuous front row of cylinders substituted, 13ft. 9in. centre to centre, with elliptical cylinders intervening. These likewise proving too weak, a close row of 6ft. front circular cylinders was tried, the back cylinders remaining as before, but tied to every alternate front cylinder by

A WROUGHT-IRON BAND

passing round both. The same method was adopted under a large grain warehouse built on the quay. Finally, in the rebuilding of part of the 1840 wall, well monoliths of concrete were, upon the advice of the late Mr. P. J. Messent, Engineer to the Tyne Commission, sunk for the foundation of a wall constructed to give a depth of about 20ft. at low water spring tides, and this plan has since been applied to the reconstruction of all the old quays requiring renewal. The blocks are 30ft. long, 20ft. wide, and 37ft. deep, with a well 20ft. by 10ft., and walls 5ft. thick, forming concrete caissons, sunk to an average depth of about 32ft. 6in. below low water, and are set about 2ft. apart, the interior and also the space between them being filled with concrete. On these blocks the masonry and concrete superstructure was built. Further details respecting the formation and mode of sinking the monolith foundations, built by Mr. W. G. Laws, City Engineer, Newcastle-upon-Tyne, will be found in a paper by his

assistant, Mr. Adam Scott, published in the Minutes of the Institution of Civil Engineers, vol. cxix., page 291.

CONCRETE CYLINDERS

have, upon the advice of the late Sir John Coode, been employed by his successors, Messrs. Coode, Son, and Matthews, for the foundation of the abutment to the new east pier to the Outer Harbour Extension at Dover. These cylinders were cast upon a lower seating ring, 12in. deep, to form a cutting edge, the cylinders being 7ft. external diameter, 15in. thick. They were cast in wood moulds with 5 to 1 Portland cement concrete, and were allowed to set at least ten days before lifting, and to season one month prior to removal from the yard to their destination. The top and bottom edges of all intermediate rings are toothed 6in. deep, and tapered lin., so as to key into each other when sunk in situ. The cast-iron cutting edge shoe is bolted into the bottom rings by lin. bolts, let in flush at the top. The interior concrete is placed in position by means of skips, so arranged as to deposit the contents as close as possible to the concrete previously deposited. Between this abutment and the old north pier of the existing harbour entrance a sea-wall exists, built by the late Mr. James Walker as engineer, in which a row of cast-iron sheet piles were driven at the toe of the outer slope between the wall and its apron. Messrs. F. and H. F. Higgs built, in Upper Thames Street,

A WAREHOUSE WITH A RIVER WALL

going down about 10ft. below the river bed, which was easily effected by means of the usual cofferdam of 12in. piles planked each side with clay puddle between, notwithstanding the fact that in sinking the other foundations a brick sewer running parallel to the river, about 40ft. from the bank and at about 15ft. down, constructed by the District Railway Company to drain their tunnel, was encountered. At Stratford the premises built by this firm were against one of the many tidal cuts in that district, hence a river wall had to be constructed. This Messrs. Higgs managed with light piles and single planking, with tarred and tongued joints bolted outside the piles, a construction sufficient to resist quiet water of no great depth. The Horse Shoe Wharf in Upper Thames Street, built by Messrs. Holland and Hannen, was erected in 1888 and 1889 for Messrs. Pilkington Bros., glass manufacturers, by Messrs. Francis Chambers and Son, as architects. The frontage of this warehouse is about 82ft., the river wall going to a depth of 30ft. below the average high water level, the basement floor being about 6ft. below high water level. In excavating for the foundation the strata passed through was made ground 12ft., wet mud, dirty gravel, old piles and previous foundations, shells and slit, lastly, clean ballast. In order to build the river wall, a cofferdam was formed by driving in two rows of 12in. by 12in. pitch pine sheet piling 6ft. apart. The piles were strapped together and the rows securely laced together with iron ties. The space between the sheeting being filled in with clay puddle, and the whole construction firmly shored from the ground at the back. A shield was provided for in the dam at shore level as a precautionary measure for draining off, as the tide receded any sudden rush of water that might have accumulated within the dam through extraordinary flood or other tides. In this instance the whole area of the basement, occupying between 15,000 and 16,000 square feet, was excavated at the same time. A deep sump hole was formed, and a steam chain pump kept constantly going to keep the excavation clear of water until the permanent river wall was constructed. It may be interesting to note that while getting out these excavations

THE OLD KENTISH RAG FOUNDATIONS

of Baynard's Castle, which occupied the site in the time of Queen Elizabeth, were discovered. The river wall of Brook's Wharf, Upper Thames Street, was built tide work by Messrs. Holland and Hannen. A sound foundation was obtained at a depth of 14ft. below the level of the shore, but no record has been kept of the class of soil passed through. The excava-

tion, concrete, footings, &c., were carried out in short lengths, as in underpinning, during the time the tide was out, and the work done was carefully covered up or cased in before the water reached it. The casing of brickwork, &c., was in no way watertight, but was sufficient to prevent the washing action of the tide. This is an economical method of constructing a river wall, but of necessity rather slow, and can only be adopted in particular cases. In 1886 the same firm constructed a quay wall to their own property in Nine Elms Lane, according to the accompanying section. The length of wall was about 100ft., and height about 18ft.; this was also carried out tide work as in the previous case, but is constructed entirely of Portland cement concrete. This is a very inexpensive form, costing between £4 and £5 per foot run complete.—Mr. Matt Garbutt, in proposing a vote of thanks to Mr. Walmisley, alluded to "sundry very interesting failures" in building which had occupied attention lately, and remarked that it was quite time architects made up their minds to give their first attention to structural requirements of a building as against the artistic. No doubt when foundations were carried down to a great depth a greater weight could safely be placed upon the soil than when the foundations were nearer the surface, because there was not an equal chance of a lateral spread. In London buildings of a moderate size, built on clay, the weight ought not to exceed two tons per square foot.—Mr. J. H. Shaw seconded the vote of thanks.—Mr. H. H. Statham gave the great new church on the hill of Montmartre, Paris, in which case, when digging for the foundations was commenced, the ground was found to be of soft, loose stuff, necessitating expensive concrete pillars, as a practical illustration of the necessity of knowing the character of the ground before erecting a building.—Mr. E. Greenop, Mr. E. Olander (engineer, G.W.R., Paddington), Mr. A. G. Flower, and Mr. Hampden W. Pratt also took part in the discussion, the President remarking that he would have liked Mr. Walmisley to have said more about the shrinkage of clay, and also to have dealt with more ordinary sites than those of great warehouses.—Mr. Walmisley, in conclusion, acknowledged the vote of thanks.

LIST OF OFFICERS.

At the close of the meeting at which Mr. Walmisley's paper was read, the list of officers for the ensuing year, as resulting from the voting, was read. The number of sealed envelopes sent in was 292, and the number of valid voting papers was 235. The result of the election is as follows: President, Mr. G. H. Fellowes-Pryne; vice-presidents, Messrs. P. J. Marvin and A. S. Flower; committee, Messrs. R. S. Balfour, H. B. Creswell, Beresford Pite, T. W. Aldwinkle, jun., W. A. Pite, W. H. Seth-Smith, Banister F. Fletcher, A. H. Hart, Matt Garbutt, and H. A. Satchell; hon. treasurer, Mr. Hampden W. Pratt; hon. librarian, Mr. C. H. Freeman; hon. secretaries, Messrs. E. H. Sim and G. B. Carvill.—Mr. Beresford Pite proposed a vote of thanks to the president for his services during the past year. Mr. Pratt had done

MORE THAN ANY OTHER PRESIDENT

within living knowledge, for he had visited all the classes of the Association, had kept himself in touch with the Studio, and had sacrificed a great deal of his time most generously for the good of the Association. They were consequently in a healthier state than ever, and it would be found when the annual report was issued that their finances and classes had flourished.—Mr. G. H. Fellowes-Pryne, the President-elect, seconded the vote of thanks.—Mr. Pratt replied.—Other votes of thanks were passed: to the members of the retiring committee; to Mr. Pratt, as treasurer; to the librarians, Messrs. C. H. Freeman and E. W. M. Wonnacott; to the hon. secretaries, Messrs. Sim and Carvill; to the Royal Institute of British Architects, for the use of the meeting room; to the visitors of the School of Design; and to the Technical Education Board, for the facilities granted to the Association in connection with workshop demonstrations.

Professional Items.

ABERDEEN.—The latest addition to the public buildings of the city is fast progressing towards completion. Occupying a commanding site at the junction of Union and Skene Terraces, the new Union Club and hall form an admirable finish to the architectural effect that is fast beautifying one of the best thoroughfares of the town, and has besides the broader effect of adding a worthy feature to the Architecture of the city. The mason work of the building is now all but completed, there yet remaining but the upper part of the hall's north gable and certain finishing touches to other parts of the fabric. At present the roofing of the club block is in progress, and the covering in of the hall will be begun almost immediately. The latter operation will prove a heavy piece of work, as the framework of the roof is to be of iron. Internally, the structure is also being pushed forward, and the plasterer will soon be at work in the club block. The cost of the building will be between £9000 and £10,000.

BRIGHTON.—The new Bible Christian chapel, Stanford Avenue, Brighton, has been opened. The building is in the Early English Gothic style of Architecture, of semi-cruciform plan, with nave and two wide transepts, and apsidal end. The window openings are mostly in narrow lancet lights and are glazed with simple patterns of delicate-tinted antique cathedral glass. The chapel is placed over the schoolroom. Internally the walls of the chapel are finished in plaster of a soft drab colour relieved by beads around the window openings and sunk mouldings of a light tint. The very comfortable pews and much of the other woodwork are of pitch pine carved and polished. In the rear are a good sized stewards' vestry and a minister's vestry. Mr. E. J. Hamilton, Brighton, was the architect, and Messrs. Saunders and Sons the contractors.

DISS.—The new Church Hall at Diss has been opened. The hall, which is situated at the entrance to Mere Street, is about 56ft. in length and 25ft. in breadth, with open timbered roof and a floor laid with wood upon concrete. The elevations of the buildings are faced with selected flints, and the corridors, dressings, and chimneys and other architectural features are formed with Cossey brickwork. Mr. Arthur J. Lacey, Diocesan Architect, designed the building, which has been erected by Mr. Ludkin, of Banham.

DUMBARTON.—After three years' work the new passenger station at Dumbarton has been completed. The station consists of two island platforms. Each platform has a complete suite of waiting and other rooms. The architect is Mr. Bond, of the firm of Messrs. Babbie and Bone, civil engineers, Dumbarton and Glasgow. The work has been carried out by Messrs. Robert M'Alpine and Sons, to the designs of Messrs. Foreman and M'Call, C.E., Glasgow, and is stated to have cost between £50,000 and £60,000.

GLASGOW.—Mr. T. Duncan Rhind, A.R.I.B.A., 44, Queen Street, has been assumed by Mr. Hamilton Paterson, architect, as a partner in the firm of Messrs. Hamilton Paterson and Watson, architects and surveyors, 10A, George Street, Edinburgh.

The memorial stone of the new buildings which are being erected in Renfrew Street, Glasgow, in connection with the Glasgow School of Art, has been laid. The new buildings have a frontage of 250ft. and a depth of 77ft. At present only a portion of the scheme as contemplated is being carried out. When finished, the school will be one of the best equipped of its kind in the country. The buildings now in course of construction comprise three floors. The basement flat is devoted principally to the applied arts and modelling, technical studies, and architecture. On the ground floor are the ornament and design sections, while on the floor above are the life and painting classes. There are also

private studios for the staff, as well as lecture-room accommodation. Mr. John Keppie, Glasgow, is the architect.

LEEDS.—The new lavatories in connection with the City Square improvements were opened to the public a few days ago. The whole of the fittings have been prepared from special designs, and have been carried out in glazed fireclay and earthenware by Messrs. Doulton, Twyford, and the Farnley Co. The walls and arches are lined with cream coloured glazed bricks, with a dado of coloured glazed bricks. The faience work in the arches, &c., carrying the deck lights, has been carried out by Mr. Whitehead. The mosaic floors have been laid by Messrs. de Grelle, Houdret, and Co. The joiners' work is executed in teak, and varnished. The whole of the lavatories are lighted by electricity. The ventilation is carried out by Blackman's electric fans, and is designed to change the whole volume of the air four times every hour. The women's lavatories are designed with private dressing rooms, &c., which are fitted up with every modern convenience. This is the first attempt to provide first-class accommodation in these lavatories for the public. The granite work in connection with the city square improvements has been carried out under the superintendence of Mr. William Bakewell, architect for the Corporate Property Committee, Leeds. Mr. Henry Whiteley has acted as clerk of the works.

MORECAMBE.—Hest Bank, on the shore of Morecambe Bay, situated some 2½ miles north of Morecambe, is showing considerable development. A Yorkshire syndicate that recently acquired a large area of lands is pushing on with building operations. The district is already provided with a sewerage system and Lancaster water. There is no doubt that in a few years Heysham, Morecambe and Hest Bank will be joined, but Lancaster's lateral development almost promises to out-distance Morecambe in linking up to Hest Bank. The eastward extension of the Morecambe promenade (the Victoria esplanade) is now perfectly complete.

NEWCASTLE.—The Erskine Presbyterian Church, Rye Hill, Newcastle, was opened last week. The new church has been erected on the site of the old Erskine church from designs of Messrs. Badenoch and Bruce, and has accommodation for 500.

OLDSWINFORD.—A new chancel has been added to St. Mary's Church. The tower witnesses to the antiquity of the church, and Mr. Chatwin, of Birmingham, the architect entrusted with the designs for the new chancel, thinks it not unlikely that there are remains of Norman work within the present casing of the old tower. The original church, which was taken down (with the exception of the tower and spire nearly sixty years ago, was a very ancient structure, and one, moreover, of very picturesque exterior, judging from the plates of it which are extant. During the present century five other churches have come into being in the old ecclesiastical parish of Oldswinford. A well-proportioned arch now divides the body of the church from the chancel, the roof of which is wagon-headed. The style of Architecture is that of the Decorated period. The chancel is faced externally with red Broomsgrove stone, and inside the dressings are of Bath stone. The side chancel aisle forms a south chapel, which will be used for early celebrations of the Holy Communion and other services. The contract has been entrusted to Messrs. Collins and Godfrey, of Tewkesbury.

PITLOCHRY.—The Committee are inviting competitive designs for the proposed public hall for Pitlochry. The conditions bear that the hall is (with a gallery) to seat 600, to be of native stone from Aldour Quarry. The total cost is not to exceed £2100, exclusive of boundary walls, seats, and architect's fee. The designs are to be lodged with Mr. Hugh Mitchell, solicitor.

ROTHERHAM.—The consecration of a new Masonic Hall at Rotherham took place last week. Viewed from the street, the block is imposing in appearance, forming a notable addition to this principal thoroughfare. On the street level are three shops, that in the centre being designed for the occupation of the owner. It includes a café, with ladies' room and kitchen in the rear. An arcade leads to a large public hall. The hall, which will seat 370 persons, has a polished oak floor. Ante-rooms and cloak rooms are provided, and a side gallery over the corridor forms a promenade, and leads to a supper room capable of seating 100 persons. Over the shops and café are three offices and a workroom. The second floor comprises the Masonic rooms, consisting of a lodge room, a large ante-room, and a supper room. Accommodation for a caretaker is provided on the third floor, and a lift from the kitchen communicates with the various supper rooms and corridors below. The front elevation of the buildings is of Stoke stone, and the window heads are filled with open Gothic tracery. The work has been carried out by Mr. Richard Snell, of Rotherham, from the plans and under the superintendence of Mr. E. Ike Hubbard, of Rotherham. Warming apparatus has been fixed by Messrs. Wright Bros., of Sheffield.

ST. IVES.—Foundation stones of a Methodist chapel and school buildings for St. Ives were laid last week. The spire will rise to a height of 82ft., while the length of the chapel will be 84ft., and the width across the transepts 53ft., providing accommodation for 450 in the body, and 100 in the gallery over the entrance lobby. The chapel will have open timbered roof of pitch pine, the seatings will also be of pitch pine, and the floor will be of wood blocks laid on concrete. Minister's and choir vestries will be provided. The school will adjoin the chapel, and comprise lecture hall, classrooms, and large schoolroom with open pitch pine roof. Preparations will be made in the basement for heating the chapel and school by hot water. The total cost, including the land and the heating apparatus, is estimated at £3500, and the work has to be finished by May 1st, 1899.

WARREPOINT (Ireland).—Warrepoint Parish Church has been improved. The present improvements include the strengthening of the tower and raising it, rough-casting the whole church in cement, and providing a new bell. The contract for the alteration of the building was carried out by Mr. Alexander Wheelan, Newry.

WEST BRIDGFORD.—The chapel which has been erected in Musters Road was opened a few days ago. The main design is in the fifteenth century period of Gothic Architecture, the chief entrance being at the base of the tower, which has an individuality and character quite its own, though in perfect harmony with that which it surmounts. Provision has been made for a clock. The windows to the east and west are conspicuous for their rich and deeply-recessed tracery. The site being almost square, the chief difficulty experienced by the architects in designing the interior was to obtain the idea, or appearance, of length, and this they succeeded in doing by keeping the north and south aisles wide and low, which consequently gives a narrower width to the nave, in proportion to which it has considerable length. The architects (Messrs. Brewill and Baily, of Nottingham) have carefully avoided the cold interior so apparent in the majority of chapels by using stained and varnished colourless woodwork, and have enriched the building by a beautifully painted roof, and the walls, being a rich chrome, give a warmth of colour which adds so much to the peculiar charm of ecclesiastical buildings. The exterior is of hammer-dressed Coxen stone, with fine Hollington stone for all dressings. The interior is treated with Corrigrit Corsham Down Bath stone. The seating capacity is 720. The contract has been executed by Mr. Wm. Maule, of Nottingham, and the decorations are the work of Mr. H. B. Spencer, of West Bridgford, supervised by the architects.

Under Discussion.

ANCIENT GLASS.

A party connected with the Glass-sellers' Company recently paid a visit to Godalming, in order to view the site of some old glass works in the neighbourhood. At the conclusion of the inspection a paper on the "Ancient Glass-making Industry in the Neighbourhood" was read by the Rev. T. T. Cooper. Mr. T. Lampard Green, the Master of the Glass-sellers' Company, presided. The lecturer showed maps of the district indicating the positions of the ancient works, and also exhibited specimens of Brode glass and Roman glass.

ARCHÆOLOGISTS IN SOMERSETSHIRE.

The Northern Branch of the Somersetshire Archaeological Society held a meeting at Stanton Drew a few days ago. Attention was first directed to the megalithic remains on land belonging to Mr. S. B. Coates, and having turned down the farm lane a short distance beyond the manor house, the archæologists were soon endeavouring to trace the circles, the largest of which had originally thirty stones or more, twenty-seven being still traceable. Many of them are underground, though in dry weather traces of these are easily recognisable. The spots whence some of the monoliths had been removed were traced. The leader of the party stated that in one instance, near the "Avenue," where a block was missing, he had probed the soil to about 6ft., and found the earth loose and a quantity of grit. His theory was that an agricultural show was held in the field some years ago, and the poles used had been thrust into the ground. When the party had strolled among the megalithic remains they repaired to the church, in order to listen to a paper read by the Rev. H. T. Perfect, who, in speaking of the megalithic remains of that parish, said the stones were of the rudest character, whereas at Stonehenge there were marks of scientific knowledge, one huge stone being made to rest on others with artificial grooves, so that the stones there were of more recent date than those at Stanton Drew. He was not aware that there was any authority for the stones being Druidical remains. It was not unreasonable to believe that, though the Druids might not have actually raised those monuments, yet, finding them in existence with great superstitions attached to them, they might have used them for their own purposes—religious, social, and political—with similar missionary ends in view as the early Christians were said to have when they converted some of the old heathen temples into Christian churches. The church was next described. The structure had gone through great changes, and but little of the earlier buildings remained. The upper part of the tower as far as the bells was taken down in 1847, and not rebuilt to its former height. The lowest part of the tower belonged to the thirteenth or fourteenth century. The interior of the church, too, had been much altered since the fourteenth century. In the wall they saw the old spiral staircase which led to the roof-loft in front of the old chancel. When the plaster was removed in 1889 traces of a text in old English black letter were to be seen over the upper doorway of the staircase, and remnants of coloured scroll work above, running along under the wall plate. In 1847 the central arcade was removed about 3ft. to the north, making what was then the narrower now the wider of the two aisles. The bosses on the roof, Caroline or Jacobean, were worthy of notice. In the north wall of the old chancel were apparent signs of a thirteenth century window; it was not known when the old chancel was surrendered and the new one built. In 1889 the interior of the church was entirely rearranged, excepting structurally, and decently furnished. The visitors before they left the village were pointed out an old dwelling known as the Bishop's House, because it is stated that episcopal courts were once held therein. Early in the eighteenth century either that or the church farm appeared to have been occupied as a nunnery.

Enquiry Department.

ARTIFICIAL CURLING PONDS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you please inform me where I could get information about the making of an artificial curling pond of cement—the depth of water to be about $\frac{1}{2}$ in. or $\frac{3}{4}$ in.?—Yours faithfully,

CURLER.

The only work with which we are acquainted that makes reference to the subject is "Skating and Curling," one of the Badminton Library series published by Longmans and Co., Paternoster Row, price 10s. 6d. There is a chapter in this containing practical hints for the construction of artificial rinks. It might be to your advantage to communicate with the builder the Glaciarium in Chelsea.

SMOKE.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I often call in my rambles at a roadside hotel, where the bar is in the parlour. The landlord is at his wits' end to discover an efficient way of dealing with the tobacco smoke. May I ask you for advice? There is a bay window. The chimney projects into the room, and has two gas brackets, one on each side, over the mantelpiece. I advised the landlord to try two funnels over these gas lights, with horizontal tubes running from them into the chimney-corners and up each corner, inside the open chimney, with two tin tubes running up the chimney to the top. Whether these would answer when there is no fire supplying the necessary heat to cause the smoke to ascend is the doubtful question.—Yours, &c.,

"GAS."

An excellent object-lesson is furnished by the hotel parlour referred to by our correspondent. Annoying as the excess of tobacco smoke may be, it merely affords an indication of more injurious, though less pungent, impurities in the air of the room arising from an absence of proper ventilation. The remedy is to be found in the adoption of means by which fresh air may be supplied and vitiated air removed without draught. This being done, the hygienic conditions will be in every way improved; not only will the smoke be carried away, but with it vapour and carbonic acid from the occupants, and the products of combustion from the gas lights. Commercially, the results should be equally satisfactory to the landlord, as facilities will be provided for dealing with the smoke from a larger nightly number of cigars, and, moreover, neither "ramblers" nor residents visiting the hotel will have their smoke-producing powers impaired by the enervating and insidious effects of an impure atmosphere. Without further information as to structural conditions, it would be impossible to state the precise methods best calculated to attain the desired results. Under similar circumstances, it is frequently found advantageous to fix air-inlet tubes or panels on the walls, and air-outlet ventilators in the smoke flues, dimensions being proportioned to the volume of air required. Assuming the existence of adequate air-inlets, the plan suggested by our correspondent would be beneficial if put in operation on a proper basis. The heat furnished by two ordinary gas burners, aided by natural warmth from the occupants of the room, should be ample for the creation of an up-draught, without the assistance of a fire in the grate. The pipes should discharge their contents so as to warm the entire column of air in the flue; sharp bends must be avoided, and the pipes ought to be of iron instead of tin, owing to the low melting point of the latter metal. In order to obtain satisfactory results, the diameter of the pipes must be governed both by the capacity of the room and by the height of the flue. If too small, the pipes will be unable to remove the volume of air necessary for adequate ventilation. As exemplifying the absence of ventilation in most dwelling houses, the case in point is a fairly typical one, but, if treated with due account of the considerations mentioned, there is no reason why all cause of complaint should not be satisfactorily removed at a moderate cost.

Correspondence.

REFORMING THE BUILDERS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Some matters which have been much emphasised of late in connection with the building trade are the way in which contractors shirk the responsibility of the buildings they undertake to erect, and the way in which our buildings are erected, even by large and well-known contractors. Go almost where you will, and the same tale is told by architects and clerk-of-works—though these functionaries are not always what they might be themselves—of how Mr. So-and-So, the contractor, has tried many schemes to introduce inferior materials. The excuse for the contractors is always the same, and that is competition; and they will tell you how they must undertake the work at prices they know they could not accept if honest work were to be the rule throughout, and so a few bad and unprincipled contractors in the beginning have dragged down an honest host in the end. We are continually hearing of workmen who do not satisfy their employers, of contractors who do not execute honest work, and of the superiority of the work done in the Middle Ages over that of to-day. In fact, to a close observer, the whole of the building industry, from the architect's work down to that of the labourers, seems to badly want reorganising, and the morals of the work seem to be in a very unhealthy period. Surely to design, to watch over, and execute a handsome edifice is food enough for the most brilliant of minds, and high enough to satisfy the most worthy ambition. Yet, in spite of what might be obtained from good work in the way of pleasure at having taken a part in its execution, the trade generally is contented to accept the work from the side of £ s. d. only.

We have room for many reforms in our age, and surely some of us are waiting eagerly for the time when once again our building trade may become fit for honest men. I am quite aware that we have good builders who are straightforward men, but they are so very few that it is hard to find them. I sometimes wonder where the buildings of the present century will be in two hundred years time, and fancy that it will be the buildings of the Middle Ages and the newly-erected buildings that will cover the land; most of those we now see will have gone and been replaced. Not only does bad workmanship and bad material

mean short-lived erections, but it means that we are living in constant danger of having our roof falling on our heads.

I should eagerly welcome any reformation in the trade by which I get my living. Let us have no more cut-throat estimating, but rather, I would suggest, that the builders form an association and agree to execute honest work. If no other scheme can be suggested a list of prices might be kept, so that instead of one builder obtaining work because his price was lower than others, it would be his method of execution that gained him the patronage.

When the employees have been reformed it will then be quite an easy matter to alter the position of craftsmanship of the day so as to favourably compare with that of long ago. We grumble at the men, and yet the conditions under which they toil (apart from monetary matters which are very favourable) is not conducive to their exerting themselves to become skilled craftsmen.

I sincerely regret having lived in an age which is advanced on the past in many ways, and yet an age in which, I believe, the building trades have sunk to their lowest level. I know something of the things of which I speak, having been engaged in the trade for many years, and having held positions ranging from mechanic to an employer of labour. Hoping this letter may promote discussion which may be of advantage to us.—I remain, yours truly,

“LOUIS ERWOLD.”

The Turriff Public School is to be enlarged. The plans for the reconstructed building have been prepared by Messrs. James Duncan and Son, architects, Turriff.

A LOCAL GOVERNMENT BOARD inquiry has been held in reference to Truro City Council's application for sanction to borrow £1250 for works of paving.

The Walton-on-the-Naze pier extension works are now being pushed on with all rapidity, and the pier-head is being formed, at a distance from the shore of 2500ft.

The memorial stones in connection with the new Congregational chapel at Hednesford were recently laid. The chapel is to accommodate 300 persons, and will cost close on £1000.

A NEW wing has been added to the Batley and District Technical School. The building, which has been erected from plans prepared by Mr. H. B. Buckley, of Batley and Leeds, is of solid stone, and is uniform with the remainder of the Cambridge Street structure.

KEYSTONES.

THE new church of St. Silas, Blackburn, has been formally opened.

A BILLIARD-ROOM, specially designed by Mr. R. T. Hookway, architect, has been added to the Bideford Conservative Club.

ACTIVE preparations are now in progress for the demolition of Dunkeld House, Dunkeld, the residence of the late Dowager-Duchess of Atholl.

A LARGE stained-glass window is to be erected in Lasswade parish church. The design selected is that of “The Last Supper,” and the window will cost about £400.

THE ceremony of laying the foundation stones of a new Wesleyan chapel at Elmswell was performed recently. Messrs. Eade and Johns, of Ipswich, are the architects. The builders are Messrs. Hogg and Son, of Coney Weston, near Ixworth.

THE restoration of the tower of St. Leonard's Church has just been completed. Certain internal work of improvement in the ancient edifice has also been carried out. The work of restoration of the tower had been in hand nearly two years.

THE extension which the premises of the Guildhall School of Music on the Victoria Embankment are to receive shortly will add to the institution a complete theatre with dressing-rooms and all accessories, and thirty new class-rooms as well. The cost is expected to be about £22,000, which is within £5000 of the sum spent on the present building when it was erected by the Corporation in 1880.

SUPPLEMENT FOR

SURVEYORS · BUILDERS ·

SANITARY ENGINEERS ·

JUNE 8TH, 1898.

Builders' Notes.

THE Metropolitan Tabernacle is still a heap of ruins, and the date for the commencement of the rebuilding operations has not yet been settled. It has, however, been decided to make the main building somewhat smaller than before, and to increase the number and seating capacity of the various additional class-rooms and vestries. It is calculated that the total cost will be £42,000.

THE work of enlarging the London and North-Western Railway Station at Crewe, and providing a complete duplicate of lines through it, is being pushed on with the utmost speed. One thousand men are now at work in the excavations tunnelling, and this number will be greatly augmented as soon as there is additional room for them to work.

THE River Wear Commissioners are now considering two schemes for the extension and deepening of the Sunderland docks, one of which, it is estimated, will cost about £100,000, and the other double that sum. The construction of a huge graving dock or pontoon, capable of accommodating the largest vessel afloat, is also under consideration.

At the Guildhall, before Mr. Alderman Smallman, Messrs. E. Lawrence and Sons, Wharf Road, City Road, were summoned for having contravened the Building Act, 1894, by making certain alterations at 2 and 4, Cripplegate Street, without the consent of the London County Council. It was asserted that separate sets of rooms had been adapted to be tenanted by different persons without the floors and principal staircase being constructed of fire-resisting materials. It was further alleged that there was an omission to make the floors and principal staircase of fire-resisting material.—Mr. Seagle Berry, in support of the summons, said it was of the utmost importance, especially after the lessons taught by the great fire in Cripplegate, that the provisions of the Building Act should be complied with, more particularly with regard to those sections dealing with fire-resisting materials. The building in question was erected for one occupation, but alterations were made subsequently in order that the place might be let out to various tenants. It would appear that only the basement and first floor were supplied with fireproof material. There were for the buildings two staircases—one going from the basement to the top floor, and the second leading only to the first floor. Now, though

the building was originally intended for one occupation, it was let out in separate tenements.—Mr. Edmund Woodthorpe, surveyor for the Northern Division of the City, said he had never given his consent to the alterations made in this building. The work done to render them fit for separate occupation comprised the placing on the ground floor of a girder, on which a 14in. wall had been built, so entirely cutting off the ground floor and basement from the other part of the building. In answer to the Alderman, the witness said there was only one staircase that was of any use for the whole of the building. It was "adopted," but not "constructed," for two separate buildings. There were four or five flues on each floor, and such could be used for fires or ventilating shafts.—Mr. Mallinson, for the defendants, did not dispute the facts, but held that the section of the Act did not apply to the case, and that the alterations complained of had virtually made the premises into two distinct buildings. It was, he urged, essentially a warehouse, whereas the section of the Act under which the defendants were summoned referred to sets of offices and chambers. The floors were let as a whole, and were not divided. With regard to the other matter, the place had been made into two separate buildings—one part having no connection with the other.—Mr. George Vickery, architect, said the place was put up for a warehouse, each floor being destitute of any division.—The Alderman said, having carefully considered the case, he had come to the conclusion to dismiss the summons, without costs. He hoped the Council would ask for a special case, as he would be most happy to grant one.

THE Executive of the Society of Carpenters and Joiners, in their official monthly report to the branches, which now number 738, state that the unprecedented successes in respect to the amicable and satisfactory settlement of various trade movements have been established. They further say that advances of wages have been conceded by employers at Castleford, Caterham, Coalville, Cromer, Colwyn Bay, Liverpool, Lynn, Lincoln, Mansfield, Preston, Rushden, Leeds, and Gravesend of one halfpenny per hour, and that at Birmingham an advance of a halfpenny per hour will come into effect next October, all overtime to be paid for at the rate of time and a half at Leicester. A reduction of hours and increased payment for overtime, upon the recommendation of the Board of Trade arbitrator, has been agreed upon at Whitby; an advance of 2s. weekly has been conceded, and alteration of hours has also been effected at

Edinburgh, Leeds, Stockton, Carlisle, Maidstone, and Bournemouth. The strikes now in progress at Blackburn and Newport (Mon.) are alluded to, and the opinion is expressed that employers will soon tire of the difficult and unprofitable occupation of seeking for hands.

AN action is down for hearing at Edinburgh in which James Golligly, apprentice bricklayer, sues G. and E. Cousin, railway contractors and builders, Waverley Market, Edinburgh, for £1500 damages for personal injuries. On 18th March last the pursuer was in the defendants' employment at the erection of the North British Railway Hotel, Waverley Station. A scaffold 63ft. had been erected, and the pursuer was working near its base when it was blown down, and he was buried among the wreckage. His injuries were so severe that his left arm and leg had to be amputated. Damages are claimed on the ground that the scaffolding was defective. It is said to have been too slim. The bolts and nails were of inferior strength, and, having regard to its height and exposed situation, it ought to have been composed of stouter beams and battens, and of properly seasoned and durable red timber. For practical purposes it was quite unnecessary to have had so high a scaffolding. If a structure of such a height was required, it should, the pursuer says, have been fixed by cable or guy ropes to the ground or buildings at its different sides, and the defenders are said to have been guilty of negligence in failing to have this done. The defenders deny fault, and say that the scaffolding fell owing to no fault in its design or construction. Everything that human skill or foresight could suggest was done to ensure its stability. It was built on the most approved plan by the most competent workmen, and all the material used in its construction was of the very best. The day when the accident happened was a day of extraordinary storm and wind, accompanied by occasional gusts of terrific force and violence. It was owing to one of these sudden squalls having struck the crane and the scaffolding that they fell.

MAJOR-GENERAL CROZIER, Local Government Board inspector, has held an inquiry at the Croydon Town Hall into the application of the Corporation for sanction to a loan of £124,582, for the erection of a new borough lunatic asylum at Warlingham, Surrey. Subject to the present application being granted, the Corporation hoped to commence the building in about a month's time.

Underground Water Supplies.*

By JOHN C. THRESH, D.Sc., M.D.

RECENT outbreaks of epidemic disease, due to polluted water supplies, had demonstrated in a terribly emphatic manner that there was either much wilful carelessness, which required to be rebuked, or much ignorance which required to be dispelled. The discoveries of bacteriologists had proved that these water-borne diseases were due to specific organisms, and these organisms might gain access to, and be carried by a water otherwise organically pure, as well as by an organically contaminated water, although the latter water would almost certainly be more liable to specific pollution, and therefore be more dangerous. Underground water was derived from that portion of the rainfall which passed by percolation into the subsoil. In this country nearly the whole of the exposed surface of the permeable strata was under cultivation, and on account of the facility with which water was obtainable, the population thereon was considerable.

SUBSOIL WATER

must therefore be contaminated at its source, and were it not that there were powerful natural agencies at work capable of producing perfect purification, underground waters would be too dangerous to be utilized for public supplies. Where such water was collected in close proximity to houses, from wells sunk in a sewage sodden subsoil, it was notoriously liable to pollution, and was a prolific cause of the dissemination of disease. The records of the outbreaks of typhoid fever and cholera in this country were sufficient proof of that. These impurities, however, were not carried far in a compact permeable subsoil, although in a fissured stratum they might be carried very considerable distances. During the progress of the polluted water through the subsoil the organic matter became broken down, and finally oxidised or burnt up, the ashes (carbonates, chlorides; phosphates, sulphates) alone remaining to afford evidence of the previous contamination. The

PARTICULATE MATTER,

including the micro-organisms, was more or less completely removed by the process of natural filtration implied by the percolation, and it seemed certain that specific organisms gaining access to the subsoil water speedily perished. There was no record of any outbreak of typhoid fever being caused by underground water taken from a wisely selected and properly protected site. The investigations of Pettenkofer, the researches of Hanser, and the recent experiments of Martin and Robertson all tended to prove that the typhoid and cholera bacilli could only flourish near the surface and in polluted soil, and Fraenkel had shown that the subsoil, even where the soil above had been grossly contaminated for a long period, was quite free from germs. That result, the author stated, he had recently been able to confirm in the examination of sand taken from various depths below the ground surface. At 4ft. very few organisms were found; below 5ft. none were discovered. These facts supported Koch's statement that "we have no reason to keep out of consumption the subsoil water which can be found nearly everywhere. On the contrary, we cannot find

A BETTER FILTERED WATER,

and one more protected against infection. Although the use of water from shallow wells sunk in populous neighbourhoods was not to be commended, there was very little doubt that in many such places a perfectly safe water could be obtained from the subsoil, from a properly constructed well, with clean immediate surroundings. Shallow wells, supplying only a few houses, drew water from an exceedingly limited area, the cone of depression rarely exceeding 5ft. or 6ft. in diameter, and it was the ground surface over that cone which required special protection. A shallow well yielding 45,000 gallons of water per day, and

* *Resumé of a paper entitled "The Protection of Underground Water Supplies" read before the Society of Engineers.*

depressing the water level 9ft., would produce a cone of depression with a base about 34ft. in diameter in a sandy subsoil. Round such a well there should be a protective area with a radius of 30ft., upon the surface of which no contaminating matter should be deposited, and which should be so guarded as to prevent the public having access. Encircling this should be an outer zone, which might be used for grazing purposes, but not otherwise manured. The area of this outer zone would have to be decided upon in each case after a due consideration of all the factors involved, such as the contour of the ground, the direction of flow of the ground water, the depth and fluctuation of the water level, &c. In certain cases an elliptical area would be preferable to a circular one, especially

IN THE CASE OF SPRINGS.

Where collecting channels fed the well, these should be not less than 10ft. below the ground surface, and included within the protective area, and within the inner zone of that area if possible. Where wells were sunk in fissured strata the form and extent of the protective area would require even more careful consideration, and should include the surface at which the fissures were most likely to outcrop. The water from the more freely-flowing fissures should from time to time be examined to ascertain whether any show signs of contamination, and if, after a heavy rainfall, the water became in the slightest degree turbid, danger was indicated. In the construction of deep wells the greatest care should be taken to exclude subsoil water, and, further, an area round the well should be protected, so that if any subsoil water did gain access, it would be free from the possibility of specific pollution.

THE USE OF THE BORE TUBE

as the pump suction pipe was not to be commended, since the external atmospheric pressure would force air or water through the most minute aperture. Where the outcrop of the stratum yielding the water was within a few miles, it should be subject to examination, as impurities entering fissures might travel such a distance. Whether underground water be drawn from a deep or superficial stratum, the chief factor in guarding it from pollution was the provision of a protective area round the well or spring, under the absolute control of the purveyors of the water, the inner portion of the zone immediately surrounded the source being so protected that neither tramps, hop-pickers, nor the general public could gain access. Existing sources of supply should be examined, and steps taken, if necessary, to secure adequate protection. Where, unfortunately, protection was impossible, it would be better to voluntarily abandon the works than wait until an outbreak of disease aroused public indignation, and compelled their abandonment.

At the monthly meeting of the Society of Public Analysts, held at Burlington House, Dr. Matthew A. Adams (Medical Officer of Health for Maidstone) read a paper on water supply in relation to the recent epidemic.—In the discussion which followed, Dr. J. W. Washbourn, Dr. Childs, Dr. Pakes, and Mr. Stoddart alluded to the bacteriological aspects of the matter, it being admitted by Dr. Washbourn that although bacteriological examination, like chemical analysis, often showed definite evidence of animal or sewage pollution, it could hitherto in no case be said to have resulted in the actual detection of the typhoid bacillus, even in water, clearly responsible for the dissemination of typhoid.—The matter was also discussed, mainly from the chemical standpoint, by Mr. Otto Hehner, Mr. Allen, Dr. Voelcker, and Mr. Cassall.—The president of the Society (Dr. Bernard Dyer) referred to the assistance often afforded by bacteriological methods of examination, however imperfect they might yet be in the confirmation of chemical results in the analysis of water, saying that the water analyst who did not familiarise himself with and make use of bacteriological methods deprived himself of a material aid in interpreting the admittedly more definite results of purely chemical analysis.

THE WELSH WATER SCHEME.

RESERVOIR CONSTRUCTION.

WORK is now being rapidly pushed forward in connection with the Frankley Reservoir included in the Birmingham Water Scheme. Hitherto public interest in the Welsh water scheme has been chiefly directed to the Elan Valley, where the great reservoirs are being constructed for impounding the waters of two important tributaries of the River Wye, and to the aqueduct by which the new supply is to be taken to Birmingham, and large portions of which upon the Welsh side of the Severn have already been constructed. Now, however, operations have been commenced nearer Birmingham, at Frankley, in connection with the provision of

A DISTRIBUTING RESERVOIR

and filter beds to receive the water as soon as the aqueduct is opened. Mr. F. W. Macaulay, who represents Mr. Mansergh, in the capacity of resident engineer, has given a few general particulars concerning the works that are now being carried out. The elevation of Frankley reservoir and filter-beds is sufficient to enable the greater part of the water-consuming district to be supplied by gravitation, but for the very highest portions there are to be additional reservoirs at Warley and at Northfield, to which water will be raised by pumping. The conduit from Wales will reach the top of the valley on the eastern side of the site, quite close to St. Leonard's Church, and will pass directly under the foundations of Frankley Manor House. The water will flow from it into a gauge chamber and inlet basin, whence it will descend a flight of steps into the reservoir of semi-circular shape, and with a

CONTAINING CAPACITY OF 200 MILLION GALLONS.

A portion of the valley head will approximately form the rounded side of the reservoir, while the lower side will be a dam or embankment about 35ft. in height and upwards of 1600ft. long. The radius of the reservoir is, in fact, to be 811ft. 6in., and its water area rather over 25 acres, the depth being 31ft. 6in. This semi-circular reservoir will be divided by a wall into two quadrant-shaped sections, so that one or both may be used as circumstances require. The walls, which will have a curved face, will be formed of concrete faced with blue brick. Between these materials will be placed a skin, half an inch thick, of asphalt. The floor of the reservoir will consist of 9in. of concrete, with a layer of asphalt on the top. Concrete and brick will be used for the inner half of the dam, but it will be widened and strengthened by an embankment, the thickness at the base of the two combined being 160ft. "Pens-tocks" or floodgates will turn the water into either division of the reservoir, or send it round by

A CULVERT DIRECT TO THE FILTER BEDS.

The draw-out chambers will be about midway round the side of each section. From the culverts the water will pass to a series of quadrangular filter beds, forming a sort of flight of steps, for some distance down the valley. Those to be constructed at the present stage will be eighteen in number, and will lie below the southern half of the reservoir, leaving others to be constructed hereafter when the demand for water increases. The eighteen beds will form cisterns, varying in size from 150 square feet to 220 square feet, and affording a filtering area of 67,000 square yards. Mains and valves will allow the water to be directed into all or any of these filters, in which it will pass through layers of sand and gravel. This process will additionally purify the water, and will also somewhat modify its softness. It will be collected at the foot of the entire system in a pure water tank, from whence it will flow into the city mains, or be pumped to the high-level reservoirs at Warley and Northfield. One of the first works that has been carried out has been the provision of a railway from Rubery, to bring materials to the site. The Water Committee have been fortunate in acquiring at the Rubery end of the line a large quarry,

affording an abundant supply of quartzite, admirably adapted for the making of concrete. The ground on the site of the reservoirs is of red marl, and the excavated material will practically be the quantity required to make the various embankments.

A PRELIMINARY WORK

of no little importance has been the laying in of a network of drains, so as to prevent the bed of the reservoir being disturbed from beneath by local springs. These drains empty themselves into Merritt's Brook, which, through the reservoir estate, will be provided with a new and direct bed. This is already in course of construction. It may be interesting to mention that the operations involve the utilisation of three-quarters of a million cubic yards of earthwork and over 150,000 cubic yards of concrete, while the pipes that have to be laid will weigh close upon 5000 tons. Frankley Lodge, which has been acquired as part of the estate, has been taken over as a residence of the contractor, and its farm buildings have been converted into fitting shops. There are also being provided on the upper part of the ground crushing and cement sheds and an electric light installation. After the preliminary operations structural work will be carried from the lower level upwards, and already embankments have been made showing the outline and position of the bottom filter-bed. The advantage of the upward process is that the drainage can all be made secure in relation to that which comes last—namely, the reservoir itself. The contractor for the work, including the railway, is Mr. A. Kellett, of Ealing, and the contract price, including the railway but exclusive of filtering material, is £315,000.

POKESDOWN URBAN DISTRICT COUNCIL have completed arrangements for a scheme of main drainage on plans prepared by their surveyor, Mr. Ingamells. Pokesdown adjoins the borough of Bournemouth to the east, and has control over a large area, including nearly two miles of sea frontage and pine woods. The drainage scheme will include sewage and surface water, which will be discharged into the sea nearly a mile beyond Southbourne Pier. It provides for a future population of 20,000. The tender of B. Cooke and Co. for the outfall works at £3708, and of Saunders and Co. for the sewers at £13,412, have been accepted.

PEOPLE are beginning to inquire when the long-projected scheme for completing the Dover Harbour works will be completed. Of course, the operations are bound to proceed slowly; but so many years have elapsed since its commencement that one might be pardoned for getting impatient. It is more than fifty years ago that Governments began to talk about it. When they are completed, however, the works will make Dover almost equal to Plymouth and Portsmouth as a fortified naval station. Twenty battleships, besides several smaller vessels, will find accommodation for berthing there. Altogether some three millions sterling have been expended on Dover, so the result ought to be satisfactory.

THE progress of the experiments with the bacteriological method of treating sewage at Knostrop was considered at a recent meeting of the Leeds Corporation Streets and Sewerage Committee. Mr. Harding, chairman of the committee commissioned to watch the experiments on behalf of the Corporation, reported on the work so far accomplished, and suggested the advisability of providing additional filtration beds in order to expedite the test. Having regard to the varied nature of the experiments, it was felt that by merely using the tanks now in existence too much time would be occupied in arriving at safe conclusions as to the efficacy of the Diben process in its application to Leeds Sewage. Mr. Diben also communicated to the committee his opinion that shallower beds should be used. Up to date the expenditure on the experiments, including professional fees, amounts to rather less than £4000, and the committee decided upon a further outlay not exceeding £5000 to provide additional filtration beds.

Surveying and Sanitary Notes.

A LOCAL GOVERNMENT BOARD inquiry has been held at Retford, concerning the proposed drainage scheme prepared by Mr. Melliss, and the application for the sanction of a loan of £40,000 for carrying out the same.

TORQUAY TOWN COUNCIL has accepted a recommendation from the Harbour Committee "that a sum not exceeding £2000 be expended in repairing a portion of the foreshore of the Haldon Pier by piling, and backing with stones and concrete."

At a recent sitting of the Water Commission in Westminster Town Hall, Sir A. Binnie, engineer to the London County Council, put in an estimate for bringing water from Wales. The Yrion would yield 121,000,000 gallons a day, the Towy 44,000,000, giving altogether 165,000,000 gallons. Reservoirs and headworks would cost £2,190,000; aqueducts, 162 miles in length, to convey 200,000,000 gallons a day, would cost £7,760,000; terminal works at Elstree, £1,911,000, and filters £1,653,750, making a total for works of £13,514,750. Adding £597,250 for law and Parliamentary charges, the total would be £14,112,000. The Thames could not be made to yield at any reasonable cost 147,000,000 a day in addition to the 185,500,000 already sanctioned. He estimated the cost of reservoirs at Staines to supply 300,000,000 gallons per day at £15,000,000.

AN extraordinary general meeting of the Metropolitan District Railway Company was held at Westminster Palace Hotel, Mr. J. S. Forbes presiding. The meeting was for the purpose of sanctioning a Bill before Parliament conferring powers on the Metropolitan Railway Company for the ventilation of their railway, and upon the Metropolitan Railway Company in relation to the working of their undertakings by electrical power, and upon this Company's and the South-Eastern Railway Company with respect to certain lands at Cannon Street, &c. The chairman went into details of the Bill, and explained that, notwithstanding any powers they obtained, they would not proceed with the change of traction until they found it quite safe to go on, and they would wait until they had the report of two eminent engineers who were going into the matter, and also until after the Central London Railway Company had been opened. The resolution was adopted.

THE Royal Commission for inquiry into the methods of treating and disposing of sewage has been gazetted. The members are: The Earl of Iddlesleigh, C.B. (Chairman); Sir R. Thorne Thorne, K.C.B., Medical Officer of the Local Government Board; C. Phipps Carey, lieutenant-colonel and hon. major-general on the retired list; C. Philip Cotton; Michael Fraser, M.A., Professor of Physiology, University of Cambridge; Thomas Walter Harding, retired lieutenant-colonel Auxiliary Forces, with honorary rank of colonel; Thomas William Killick; William Ramsey, Professor of Chemistry, University College, London; James Burn Russell, M.D. and M.Ch.; Fred James Willis, Secretary. By the terms of the reference the Commission is to inquire—(1) What method or methods of treating and disposing of sewage (including any liquid from any factory or manufacturing process) may properly be adopted consistently with due regard for the requirements of the existing law for the protection of the public health and for the economical and efficient discharge of the duties of local authorities; (2) if more than one method may be so adopted, by what rules in relation to the nature or volume of sewage or the population to be served, or other varying circumstances or requirements, should the particular method of treatment and disposal to be adopted be determined; and (3) to make any recommendations which may be deemed desirable with reference to the treatment and disposal of sewage.

Trade and Craft.

NEW REFUSE DESTRUCTOR AT NORWICH.

The new refuse destructor at New Mills, Norwich, erected by the Horsfall Furnace Syndicate, Limited, of Leeds, is now in full operation. The steam required for sewage pumping purposes is supplied by the destructor.

A RUST-PROOF PAINT.

A rust-proof paint, called Anticorin, which has attained very considerable success on the Prussian State railways, and also on several German steamboat lines, is being introduced in London. It is stated to be proof against acid and sea water, and to be made in any shade or colour. It can be used for the interiors of boilers.

MESSRS. B. WARD AND CO.

Messrs. B. Ward and Co., of 15, Great George Street, Westminster, S.W., have recently patented a new stair tread which promises to become very popular. It is described as Ward's Artificial Stone-leaded Stair Tread, and consists of the introduction of lead discs in the step. The lead is cast in the form of a grid, so that each dot is, as it were, tied together; it is $\frac{3}{4}$ in. deep. Among the advantages claimed—and rightly so, we believe—for this invention are that it prevents slipping, there being no surface to polish; that it is neat and ornamental, and at the same time durable; that it can be adapted to any steps, and effects a considerable saving over stone; and that there is no danger of the lead dots working out. These stair treads have already been used at the extension of the Architectural Museum, at Messrs. Donald Currie and Co.'s new offices, and elsewhere. It appears to be a patent that will be largely in demand for stairways in business houses and buildings, or wherever there is much traffic.

ARE ELECTRIC COMPANIES DOOMED?

Electric light shares have been very depressed lately on the adverse action of many London vestries. This fall in values will, however, be purely nominal in comparison with the "slump" that will take place if a rumour now going around the City proves true. It is stated that a Syndicate has been formed to acquire certain inventions for generating electricity by air. The discovery, if reports are at all to be relied upon, is one of the most important and far-reaching of the century. With a small apparatus, weighing only a few pounds, and without the aid of gas or steam power or dynamo, sufficient current can be generated for lighting any ordinary dwelling-house. Experiments conducted over a period of some months are said to show that very striking results can be obtained by this method, and that the current developed remains quite constant. By means of this invention it is expected that the supply of electric current will be brought within the reach of all without the necessity for taking it from corporation or company mains, and at a trifling cost as compared with the present charges for current.

MESSRS. GEORGE TROLLOPE AND SONS.

Messrs. George Trollope and Sons inform us that in consequence of Her Majesty's Commissioners of Works having acquired and pulled down No. 15, Parliament Street, Westminster, which has been occupied by their firm since 1777, they have opened new offices at 14, Mount Street, Grosvenor Square; and at 5, Victoria Street, Westminster. The new offices will be in direct telephonic communication with Messrs. Trollope's other offices.

A SHEET-STEEL sewerway is one of the latest evidences of the steel age. It is being put down in Jersey City, U.S. About 260ft. have been laid; the total length will be 1850ft. The metal is stated to be less expensive than a three-course brick sewer of the same diameter, namely, 5ft.

PRACTICAL CARPENTRY AND JOINERY.*

BY GEO. ELLIS.

(Continued from page xxi.)

VIII.—DOOR FRAMES & FINISHINGS.

FIG. 125 shows the method adopted for forming the hanging jamb of a recessed or "warehouse-hung" door. It is in frequent use in business premises, where the door has to be kept constantly open. As will be seen on reference to the drawing, where the dotted

FIG. 125. PLAN OF RECESSED DOOR.

lines indicate the position of the door when open, an unbroken surface is then presented by the door and frame, the former having the appearance of the lobby enclosure, as its front edge fits closely up to the screen or swing door. The jamb is built up in two pieces, grooved and tongued at the joint, as this is both stronger and more economical than working it out of the solid; a tenon is cut on the outer part of the post, the inner or rebate back being tongued into the head. The door is beaded on the edge with a bead of the same size as the knuckle of hinges, and these are let in flush. When the door is closed the bead is hidden behind the jamb, and when open it breaks the joint. The rebate of the hanging post must equal the thickness of door, plus an eighth of an inch for clearance, and the lobby framing finishes flush with it, this framing being covered during the day, is usually made plain; the opposite piece, however, is made to correspond with the door, as is also the soffit framing.

The three principal varieties of jamb linings are "plain," "framed," and "double-framed,"

FIG. 127. END OF SOFFIT LINING.

these terms defining the method of construction. A complete lining for an opening consisting of two jambs or sides and a soffit or head, is called a set of linings. The term "plain" is applied to any lining, however it may be ornamented, that is made up of one flat board, or surface. If a rebate is formed on one edge to receive a door, it is further distinguished as single faced or rebated, and if similarly treated on the other edge, double ditto. The flat surface against the edge of which the door rests is called the stop. In inferior work these are nailed upon the surface

* All rights reserved by the author.

of a stouter and wider board, so as to form a rebate, without the labour of working it, and they are sometimes left loose until the doors are hung to facilitate that operation when the latter are made in winding.

The isometric sketch (Fig. 126) shows a set of double rebated plain linings for a sin. wall, out of 1½ in. stuff, also a double set of grounds in situ, a portion of the latter being broken away to show the construction. The linings are grooved and tongued together at the head, and nailed in the manner shown in Figs. 127-128; the tongue in the rebate is often omitted when the latter is less than 2 in. wide.

Grounds are light frames made to surround all openings in walls that are to be plastered, for which they act as a gauge and a key; the various finishings, architraves, linings, &c., are also fixed to them. They should be framed perfectly square, the front edges square with the face, the back edges bevelled slightly under to form a key for the plastering, and fixed plumb and parallel with the wall. Where double sets are employed the face edges should line with each other, and be tied together with cross pieces dovetailed in, called backings (see Fig. 126). The grounds should be securely fixed to joint pads or wood plugs, and are out of 1 in. stuff of such width that their back edges are ¾ in. behind the architrave. Fig. 129 shows clearly how they are put together.

After the grounds are fixed, and there is room in the opening, as in Fig. 126, the soffit is notched out as shown, and nailed to the backing piece in the middle. The jambs are then cut tightly between head and floor, the tongues entered into the grooves, and the lower ends forced back into position, where they are secured to grounds and backings. It occasionally happens that the grounds are not

FIG. 128. TOP OF JAMB LINING.

made exactly to the size of the linings, and a space exists between them. When the door is hung there is nothing but the backs of the rebate to hold the screws, sometimes not quite an inch thick. This is insufficient, and blocks about 1½ in. wide by 4 in. long are fixed at the back in the position the hinges will come, to receive the screws, as shown on the right side of Fig. 126.

Another form of plain lining suitable for a thicker wall is shown in Fig. 130. This is known as a skeleton lining; so called because the stop is fixed to a framework of stout square stuff. Two square frames to form the rebates are fixed together with cross rails; upon these the stops are fixed, and should overhang the inner edges of the frames ¼ in. When the wall is of such thickness that the stop would exceed 1 in. in width, it becomes necessary to frame the linings and insert panels as shown in Fig. 131, which is a sectional elevation of the top end of a framed jamb and soffit, with grounds, lintel, and architraves. The proper method of putting these frames together is indicated in Figs. 127, 128; the grooves would be stopped in polished work, but there is no necessity to do so in painted finishings. The head on no account should be cut between the jambs, as any yielding of the backings would produce open joints, and excellent fixing is obtained by driving folding wedges between the lintel and head immediately over the jambs, thus avoiding the necessity of nailing

the latter, which in the case of a strong piece of stuff will often cause a shake to appear.

Fig. 131 is a horizontal section through one jamb, and the finishings of a double-framed lining, showing also a portion of the soffit in plan. In this variety the stop is framed and panelled; the rebates formed on the edges by separate pieces of square stuff, framed to them by double grooving. The tongues should be well fitted and left dry, to permit subsequent shrinkage, without disturbing the architrave. This method forms a first-class lining, all the

FIG. 131. DOUBLE FRAMED LINING.

rails can be tenoned through and wedged, as the ends will be hidden by the outer frames. These frames being substantial just where required, afford a good fixing for the door and the construction renders secret fixing easy. If the stops are first fixed as a complete frame, buttons can be attached at the back, to turn into mortises in the backings, then the rebate pieces inserted covering all up and making a good finish. The moulding bordering a door or window opening is known as an architrave, if moulded on the back or extreme edge, as "double-faced," if made up in two widths, as double moulding. An architrave should not be fixed at both edges, for if so something must go when the wood shrinks, and it must be remembered that nothing short of absolutely sealing the pores of the wood, back, front and ends, will prevent shrinkage, and the drier the stuff the more readily will it absorb moisture from its surroundings to be evaporated in hot weather, with consequent reduction in the width of the stuff, and if this is not guarded

FIG. 129. CONSTRUCTION OF GROUNDS.

against, shakes or gaping joints will result. The best place to fix a narrow moulding is in the middle or near its thinner edge. The moulding should not be designed so as to be thin in the middle and thick towards its edges as it will inevitably curl off. No architrave should be made wider than 5 in. in one piece, but should be treated as in the left hand example of Fig. 118. This would be fixed through the two extreme edges, leaving the interior edges free to swell or shrink. In thick mouldings the mitres should be framed with mortise and tenon, or handrail screw and dowels. All mitres upwards of 4 in. long or ¾ in. thick should be ploughed and tongued, as there is little or no hold for glue in the end grain. It is advisable to provide blocks at the

UNIVERSITY OF ILLINOIS

feet of architraves to protect the mouldings from wear, a quarter of an inch projection from the outline of the moulding will be sufficient, and the block should be secured to the moulding by a dovetail tongue, driven in the direction of the grain and screwed at the back.

(To be continued.)

SIR ROBERT RAWLINSON, the distinguished sanitary engineer, died on Tuesday week in his eighty-ninth year, at Lancaster Lodge, Boltons, South Kensington. Sir Robert Rawlinson was the son of Mr. Thomas Rawlinson, mason and builder, of Chorley, and was born on February 28th, 1810. He learned the building business under his father, and afterwards worked as an engineer under Jesse Hartley and Robert Stephenson. Rising rapidly, he became successively assistant surveyor to the Liverpool Corporation and engineer of the Bridgewater Canal. In 1847 he devised a gigantic scheme to supply Liverpool with water from North Wales, but it was then thought too ambitious. He designed the hollow brick ceiling of St. George's Hall, the lightest work of that class existing. In 1848 he became one of the first inspectors under the Public Health Act, and as such made the first inspection (at Dover) and wrote the first report. He devised and established a new system of main drainage which is in use all over the world. In the Crimean War he went out as Engineering Sanitary Commissioner, and did a remarkable work in the way decreasing our Army's mortality then and since. Germany and America have warmly acknowledged their indebtedness to him in this respect. In the Cotton Famine he was commissioned to organise public works under Mr. Villiers, which he did with a remarkable financial and sanitary success attested by the Act which, in consequence, was passed enabling the issue of State loans to Sanitary authorities, and the triumphant working thereof. Sir Robert Rawlinson was for twenty-eight years a member of the Army Sanitary Committee, had been Chief Engineering Inspector under the Local Government

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
June 11	Eggleston, Darlington—Erection of Fence	Parish Council	J. C. Hill, Eggleston House, Eggleston.
11	Bridlington Quay—Erection of Two Houses	J. Taylor	S. Dyer, Architect, Bridlington Quay.
11	Faygate, Sussex—Rebuilding Inn		W. Buck, Architect, Horsham.

* Accepted subject to arrangement.

WEMBLEY, MIDDLESEX.

A number of IMPORTANT FREEHOLD BUILDING SITES, comprising portions of the highly favoured Building Estate known as "HARROWDENE," about three minutes' walk from Sudbury Station, on the L. and N.W.R., and about one mile from Wembley Park Station, on the Metropolitan and District Railway. The plots all occupy capital positions on the rising ground to the west of the first-mentioned railway, and possess GOOD FRONTAGES TO THE HARROW-ROAD, the Harrowdene-road, and Crawford-avenue, with depths varying from 200 to 300ft. The Estate is laid out with 50ft. roads, planted with trees, and provided with means of lighting; house connections are laid; gas and water mains are put in throughout; and the carriage-ways have been taken over by the Local Authorities. The best of the sites are eminently suitable for the Erection of Residences ranging from £60 to £100 per annum, whilst others are intended for Villas with rentals of from £35 to £40 per annum.

MESSRS. WALTON and LEE will OFFER the above for SALE by AUCTION, at the Public Offices, Wembley, on THURSDAY, JUNE 23rd, 1898, at SEVEN o'clock p.m. precisely.

Particulars may be obtained of Messrs. FLADGATE and Co., Solicitors, Craig's Court, Charing Cross, S.W.; or of the AUCTIONEERS, at their Offices, 10, Mount-street, London, W.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I. B. A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

ADMIRALTY EXAMINATION for ASSISTANTS now announced. Preparation by correspondence, personally or resident. First place on two recent occasions.—G. A. T. MIDDLETON, 19, Craven-street, W.C.

NOTTINGHAM.—Old-established SANITARY PLUMBER'S BUSINESS, chiefly contracting, for DISPOSAL, owing to death of proprietor; main thoroughfare; recently fitted up workshops; splendid modern plant; unique opportunity for wholesale plumbing business; large contracts running.—For particulars, apply MELLORS, BASDEN, and MELLORS, Estate Agents, Nottingham.

WORKS and REPAIRS to MILITARY BUILDINGS in the UNITED KINGDOM (including PAINTING).

The Secretary of State for War hereby gives notice that Builders desirous of being applied to when TENDERS are invited for work in the Military District should address the General Officer Commanding, giving trade and bank references, and stating whether they wish to Tender for (A) Jobbing Work, Painting, and Repairs, (B) New Buildings or Works up to £5000 estimated value, or (C) New Buildings or Works of any magnitude.

Applications unaccompanied by references will not be noticed.

Firms whose names are already on the War Office list need not apply.

A. MAJOR,
Director of Army Contracts,
War Office, Pall Mall, S.W.,
June, 1898.

APPOINTMENTS VACANT.

CLERK of WORKS WANTED at once for business premises, public hall, &c. Experienced man.—Send references and testimonials to E. R. RIDGWAY, Architect, Long Eaton.

SURVEYOR'S ASSISTANT WANTED, experienced in abstracting and billing.—Apply to M., 10, Delahay-street, Westminster.

WANTED, ARCHITECTURAL ASSISTANT in Municipal Office of large Midland town. £2 10s. per week.—Apply, enclosing copy tests, Box 729, BUILDERS' JOURNAL Office.

CLERK of WORKS REQUIRED at once, to superintend the Erection of Business Premises in Bedford.—Applications, stating age, qualification, and salary required, and enclosing copies of not more than three recent testimonials, to C. E. MALLOWS and GROCOCK, Architects, Times Buildings, Bedford.

APPOINTMENTS WANTED.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES to ASSIST others in the PREPARATION of DRAWINGS at his own office.

G. SCOREE, 28, Newman-street, W.

ARCHITECT'S experienced ASSISTANT seeks RE-ENGAGEMENT. Well up in preparing drawings for large public buildings, hotels, warehouses. Understands quantities. Assoc. R.I.B.A.—A. C. D., care of Newlands, 5, Little Trinity-lane, E.C.

JUNIOR ASSISTANT seeks ENGAGEMENT with Architect. Aged 21. Three years' experience in Government Office. Neat draughtsman, tracer, colourist, &c.—W., 3, Eton-place, Plymouth.

TO LAND AGENTS and COUNTY SURVEYORS.—Plans from rough sketches by first-rate draughtsmen. Farm Buildings and Workmen's Cottages a speciality. Most moderate terms.—Letters, ROYAL ENGINEER, care of Mr. West, Avonmore Villa, Knaphill.

ARCHITECT'S ASSISTANT desires RE-ENGAGEMENT. Seven years' London and country experience. Working and detail drawings.—G. C. P., 21, Yorke-street, Southsea.

ARCHITECT'S ASSISTANT desires ENGAGEMENT in London. Seven years' experience; thoroughly practical, can take job from start to finish, survey and level.—"Ivanhoe," BUILDERS' JOURNAL.

LAND SURVEYOR and DRAUGHTSMAN requires SITUATION. Five years' experience. Good reference.—Address, R. B. L., 4, Brook-street, Stoke-on-Trent.

An Architectural Causerie.

Architecture at the Academy: A Suggestion.

A VISIT to the Royal Academy, during the Summer Exhibition, brings very forcibly to one's mind the inadequate representation afforded to Architecture com-

voted to painting, sculpture, and black-and-white drawing, and a single apartment only to Architecture. This is surely out of all proportion. Although there are some interesting designs and many beautiful drawings, it is entirely evident that this little room contains an altogether inadequate display of the best Architecture of the year. The greater part of the works hung are presentiments of unimportant buildings, often of mediocre design, and the meritorious examples are so insufficiently illustrated as to generally render them unintelligible. The architect must always labour under a disadvantage in any exhibition, in that he cannot show his real Architecture but only drawings of the same. These are but a means to an end, and if we would enjoy his work at its best, we must visit and study his actual works "in the round." Herein an architect is obviously handicapped when compared with the painter and sculptor, and much of his best work is consequently known only to a select few.

The remedy that occurs to my mind is not far to seek, viz., greater realism. If meritorious designs only were hung, space could be found for a more complete illustration of each subject, and to obtain the nearest and most faithful approach to reality, photographs of executed work should most certainly be admissible. A series of photographs, supplemented with plans and other geometrical drawings, is undoubtedly the best mode of rendering Architecture. Beauty of proportion, refinement and appropriateness of detail, effects of light and shade, and all the qualities that go to form a fine building, only excepting colour, are faithfully brought out in a good photograph. The use of perspective drawings or models would then probably be limited to proposed works, or, to use an expressive French word, *projets*. A well-considered scheme for admitting photographic monographs of good Architecture would have the effect of bringing to the public notice much of our best current work, and might even

CHURCH OF ST. URBAIN, TROYES.

[In Illustration of "A Summer Sunday in Troyes."]

pared with that of the sister Arts. At the outset it may be granted that painting and sculpture have greater living exponents, and are, therefore, deservedly more popular; still the fact remains that fifteen galleries are de-

Under the present conditions it is only to be expected that the general public, as well as artists themselves, should take far less interest in architectural exhibits compared with those of painting and sculpture.

induce some of our absentee architects to exhibit. It is much to be deplored that such men as Philip Webb and John Bentley have rarely, if ever, shown drawings at the Academy, and even architect-members of

this body themselves are frequently unrepresented. This must be ascribed to the unsatisfactory rendering that generally results, as well as to the time and trouble that is occupied in preparing special "show" drawings of executed work. Draughtsmanship and not fine qualities of architectural design, too often determine whether a drawing shall be hung, and it thus happens that mediocrity, made interesting by accomplished perspective draughtsmen, is hung to the exclusion of more meritorious work. As a consequence, much of our Architecture is unknown, not only to the public, but to many architects themselves, and even to members of the Royal Academy! In spite of the increasing interest that is now taken in matters artistic by so many of the cultured classes, an intelligent knowledge and appreciation of modern Architecture is rarely to be met with. Architecture requires an educated taste to be properly appreciated quite as much as painting, sculpture, or music. Greater space, a more careful selection, and realistic exhibits rendered interesting by the aid of photography, might go far to rouse the present apathy of the public, and certainly should create a greater appreciation of this art in the Royal Academy itself. It may be urged against my proposal that the galleries are already filled to overflowing, and that therefore it would be impossible to devote more space to architectural delineation. Personally, one feels very strongly that a higher standard of excellence, with the consequence of fewer pictures, would not only provide the necessary room, but be in itself a great improvement to the present condition of things. A gallery (not a *cul-de-sac*) devoted to the proper illustration of Architecture, should form an agreeable interlude to the ten or twelve hundred pictures that we are yearly expected to admire.

J. E. N.

On the Use of Stock Materials.

At the beginning of an architect's career—when the first client puts in an appearance and asks awkward questions—problems seeking immediate solution rise up and confront him. Among the first of these is the question, How far is it advisable to encourage and make use of stock materials in a building which is intended to be beautiful? It should be said here that the term "stock" is used in a limited sense, and is not meant to apply to stock articles of furniture, etc., but to runs of mouldings, battens, flooring, match-boardings, etc., where there is still scope for thoughtful arrangement without much alteration of the forms to hand. If the architect is "artistic," and wedded to the belief that no good can result from the combination of forms already in the market, his inclination will be to ignore the subject—and the materials. This is unfortunate, both for client and architect; but it is too often the rule that the architect who lays claim to being an "artist" is less familiar with the many ways in which materials are sent out than his commercially-minded brother architect. The chief reason for this ignorance seems to be that the "artistic one" is too frequently content to assume the impossibility of stock materials being utilised to a beautiful end, which is, perhaps, only another way of saying that while machinery holds the field no really great work can be accomplished. This is only half a truth, and while it is quite reasonable for an architect to regard present conditions as unfavourable to the pursuit of his calling, it is not wise to sit in an office waiting the advent of some wealthy and sympathetic patron—or the millennium. It is quite too negative a state of mind, and the sooner he dies and goes to Heaven the better. It is wiser, as Sedding says, "to suppose that machinery and its results will not be discontinued. Manufacture to-day cannot be

organised on any other basis. We had better clearly recognise this; better make life square with facts rather than rebel against the actual and inevitable." The commercial architect has long since availed himself of machine-made forms and the necessity of using them in building. Shapes, scantlings, and quality, in which materials are turned out by the manufacturer, are at his fingers' end; but he ignores, either from want of time or, more frequently, lack of ability, the possibility of converting them into pleasant and interesting results. The architect with the Liberty tie who could do this is handicapped from ignorance of scantlings. It follows that the man who both knows the ordinary forms in the market, and can make his own their possibilities, will be the most likely to produce the best results. It is safe to assume that no sensible architect desires to use machine work at the expense of handiwork, but it is suggested that, under present conditions, a thoughtful arrangement of stock materials can and does yield pleasing results. A room, providing it is kept ascetically simple, may be so designed, and, within certain limits, be very successful; but elaborate that same room with machine-made decoration of the very sumptuous or public-house style, and it becomes hideous.

G. L. M.

OLD CHURCHES AND HISTORIC MANSIONS.

WITH ANTIQUARIES IN GLOUCESTERSHIRE.

THE neighbourhood of Yate, in Gloucestershire, is prolific in old churches and historic mansions. The district was explored a few days ago by the Bristol and Gloucestershire Archaeological Society. Iron Acton, with its old Manor House was first visited. This residence of the Poyntz family appears to have been re-built in the time of Queen Elizabeth, and to have been considerably altered in the reign of Charles I. The large courtyard on the eastern side of the house is entered by a handsome gateway, in the spandrels of which, in low relief, appears the Poyntz crest. This arch was probably erected in the time of Charles I. The house, when occupied by the last of the Poyntzes, in the middle of the 17th century, appears to have consisted of a central building facing east and west, with north and south wings, the former of which remains. A hundred years ago a huge buttress was erected to protect the bulging walls; another has been added lately. The 15th century Perpendicular window, on the extreme left, is said to have lighted the chapel; but there is nothing inside to support the tradition. The church was next visited. The rector pointed out some of the prominent features of the structure. He directed attention to the fine preaching cross, the small

REMAINS OF THE OLD PARSONAGE

which still existed, the tithe barn, and stables of great antiquity, which were all objects of interest, though, perhaps, not so deserving of notice as that fabric of the church. He remarked, in glancing at the interior of the edifice, that, though some of the pews had been restored, the work of renewal was carried out with due regard to the character of the original fittings. He also called attention to the curious fact that nothing is in the centre of anything else, no arch is in the centre of any other arch. The church, which is dedicated to St. James the Less, consists of a western tower, a nave with porch, a south aisle which is continued eastward, and a choir. The church is probably about the same date as the cross; the lower part of the tower is, perhaps, somewhat older. On the parapet of the tower, looking toward the north, is the half-length figure of

A KNIGHT IN ARMOUR,

probably removed from the church. The church contains several Poyntz monuments; the oldest, an effigy of a knight in the armour

worn in the latter part of the reign of Edward III., probably represents John Poyntz, son and heir of the first Sir Nicholas Poyntz, and Maud, the heiress of the Actons. By his side lies the effigy of a lady unknown. Two encased slabs in the burial chapel of the Lords of the Manor commemorate Robert Poyntz and his first wife Anne. In the north-east window of the chancel is some fine fifteenth century glass. The middle light probably represents Edward IV., as in the same window is the falcon and fetterlock, a badge of that king. The value of royal badges in fixing dates has been, until of late, overlooked. On the left of the king is an ecclesiastic with a triple crown, and therefore probably a pope, and on his right a mitred bishop. Amongst other objects of interest in this church are the

JACOBÆAN PULPIT,

with sounding-board, the rood loft stairs, a curious chamber on the north side of the tower often used as a parish lock-up, a handsome Georgian brass candelabrum, and the altar railings dating from the time of Archbishop Laud. At Yate Court the party rambled about the grounds, and viewed the ruins of what must have been originally an extensive building. The remains of this ancient fortified dwelling stand within an oval moat, about 100yds. long by 80yds. wide. The deep moat, though narrowed by the *débris* from the falling walls, is almost perfect. It is very difficult, without long and careful study of the ruins, and comparison of them with strongholds of the same date, to picture the castle as it stood in all its magnificence in the time of the disinherited Lords of Berkeley, who built it and dwelt here whilst Henry VIII. and Edward VI. held Berkeley Castle, their ancestral home. The drawbridge over the moat has long since been superseded by a permanent roadway, but the graceful outer arch, with its characteristic hood moulding, still contains the groove through which the portcullis fell to bar the further progress of a foe who had already crossed the moat. The beautiful window above this arch, with its two principal lights, and with quatrefoil and trefoil mouldings in its head, gave light to a large guardroom above the vaulted gateway, the massive fireplace of which still remains. A barn on the east side of the gatehouse acts as a buttress to preserve it. The most interesting periods in the history of Yate Court are the thirteenth and the first half of the fourteenth century, when the De Wyllingtons occupied it; the first half of the sixteenth century, when the Berkeleys were here; and the autumn of 1644, when it was occupied by a parliamentary force from Gloucester, who soon after abandoned and destroyed it. Alexander Staples held Yate Court at the time of his death, in 1590, as the inscription on his brass in Yate Church shows us. A rather long drive through beautiful scenery, with fine views of Tortworth, Nibley Knoll, and Hawkesbury Upton, was taken to Horton, permission to visit the Court having been granted by Admiral Sir F. Richards C.B. The greater part of the mansion is unfurnished, since the owner only stays there a day or two in a year. The house belongs to two very different eras: to the Norman of the twelfth century, and to the Renaissance or Tudor Gothic Architecture of the sixteenth century. The north wing is one of the very few Norman unfortified domestic buildings remaining in England. The main part of the house was evidently built in the early part of Henry VIII.'s reign on the site of an earlier house. It consists of a central gable running east and west, and two others running north and south. On the left the dining-room, with a Tudor fireplace, having

THE ARMS OF THE BUILDER.

On the right is the drawing-room, with a Queen Anne look about it, and a pretty little boudoir beyond. Behind the drawing-room is the ancient kitchen. There are no stirring annals of Horton Court. The Manor in the time of Harold belonged to his third son, Ulf, whom William the Conqueror sent to a prison in Normandy when he had confiscated his lands. Little Sodbury Camp and Manor House were also visited.

A SUMMER SUNDAY IN TROYES.

By THOS. FRANCIS BUMPUS.

THE province of Champagne generally, and the city of Troyes in particular, will forever be associated in my mind with one of the most refreshing holidays spent among those "glories" of France, her cathedrals and churches.

It is half-past five in the afternoon, and a long day has been devoted to the ecclesiastical treasures of Paris. With Flandrin's noble frescoed procession of saints at St. Vincent de Paul in the mind's eye, and the last strains of the Gregorian Chant at Compline in Notre Dame ringing in the ears, I am speeding along by the Seine and Yonne in the crowded Dijon train towards Sens. Darkness has set in ere I alight at the station of this staid little archiepiscopal city, so that it is early morning when my first impressions are formed of the interior of its cathedral,

whose solitary Flamboyant south-west tower* forms, with the general bulk of the edifice, a landmark in the flat Champagne country for miles round. But it is not upon Sens cathedral, so dear to the hearts of Englishmen from its resemblance in many details to parts of our own glorious Canterbury, that I propose now to linger; nor upon Joigny, amid whose quaint, hilly, tortuous streets on the northern bank of the Yonne three very interesting old churches are to be found—especially delightful, being that of St. John the Baptist, an extraordinary production of the Early Renaissance. Nor upon St. Florentin must I dwell—St. Florentin, with its naveless, Beauvais-like church, rich in Palladian screens to the chapels encircling its choir, and preserving one of the few *jubés*—a very late one it is true—that

* Sens is not the only instance of a French cathedral façade equipped with a solitary steeple, Meaux, Troyes, Auxerre, and Soissons offering similar examples. At Sens the northern tower was only removed during the forties of the present century. May its rebuilding be not far distant!

A subsequent visit was paid to Sens on a Sunday afternoon. It was just such an afternoon as that described by George Eliot in the eighteenth chapter of *Adam Bede*! There had been heavy showers at Auxerre in the morning, but when I arrived at Sens "the clouds had rolled off," and lay in towering silvery masses on the horizon. The vast Transitional cathedral was glorified by the afternoon sunlight, and the office hymn for the festival of the Transfiguration "Quicumque Christum queritis" was rolling grandly through the building.

revolutionary fury and Early Empire had taste have spared to France. Fain would I, too, dwell upon the not far-distant Pontigny—that lowly-situated, simple, solemn, First Pointed Cistercian Abbey Church, another French building that has such large claims upon the sympathies of English churchmen, from the fact of three most illustrious Archbishops of Canterbury, A. Becket, Stephen Langton, and St. Edmund, having found an asylum within its precincts when driven by troubles from their native country.

Nor can I do more than briefly refer to Auxerre, with its great tawny First Pointed and Flamboyant St. Etienne; its truncated St. Germain with its isolated Chartres-like spire; and its voluptuously Renaissance St. Pierre, all proudly dominating the houses stretching between their apsidal east ends and the Yonne.

No! upon none of these must I now linger, but hurry with my readers along that uninteresting bit of railway line uniting St. Florentin with the old capital of Champagne, where is enshrined that gem of the thirteenth century, the church of St. Urbain, an illustration of which, from the facile pen of Mr. Albert Hanson, embellishes the present number of our paper.

Delightful it is to wake up at six o'clock on Sunday morning in one of the large, airy bedrooms of the Hotel des Courriers at Troyes, and to see glorious Old Sol tinge the peaks of some antique gables opposite with his golden fingers. But all this is as nothing compared with the subsequent pleasure of inhaling the sweet early morning air as it is wafted through streets of old timbered houses from the vast tract of flat country environing the city, or while threading the mazes of that most agreeable of lounges—a French flower market. Thus, interspersed with an occasional dive into a church or two, where the white chasubled priest moves softly to and fro before the altar in the stillness of the early morning mass, the time before breakfast glides away most delightfully.

The Troyes churches cluster almost as thickly as those in Cologne. If not of the highest order architecturally—being chiefly in a very plain, I had almost said bald, Flamboyant style peculiar to this district of Champagne—they have managed to retain a considerable amount of old furniture, and the picturesqueness thus imparted to them is much enhanced by the narrow, high open-backed benches with which they are seated in lieu of the chairs customarily met with in French churches.

In succession, I visit St. Jean, remarkable, not only for its lofty clerestoried choir of pointed windows, filled with Renaissance tracery—a choir which rises clear above the tracements with which the church is almost completely hemmed in—but for its altar piece, which is embellished with the painting by Mignard, a native artist, of Our Saviour's Baptism. Usually, this picture is kept veiled, but to-day being "Dies Dominica" it is disclosed to public gaze.

St. Nizier, St. Remi, St. Pantaleon, and La Madeleine, before whose matchless early sixteenth century rood-loft—"a curtain of lace, cut in marble"—I spend some time rapt in admiration, all, in some point or another, challenge the attention. At length, I stand before St. Urbain's which, with its gracefully contoured Decorated apse, profiled against a sky of purest cobalt, and with the early morning sun streaming through the storied panes of the old stained glass of its windows, throwing choicest hues upon the surrounding stonework, fairly earns on this occasion the eulogium, passed upon it by one whose name is, I trust, not wholly forgotten in architectural literature.* "For a building of its size, it is the most enchanting architectural spectacle which the genius of man has bequeathed to the admiration of successive ages."

Begun in 1262 by Pope Urban IV., son of a shoemaker of Troyes, on the site of his father's workshop, this elegant church for more than six hundred years remained but a fragment,

* Thos. Inkersley (*Romanesque and Pointed Architecture in France*) (1850).

INTERIOR OF ST. ETIENNE, AT AUXERRE.

consisting only of a choir and transepts. The pier arches and western portals of the nave had been raised when the works were abandoned, only to be resumed within the last ten years.

The spirited drawing which accompanies these notes precludes any detailed description of this thirteenth century gem. "Le plan de l'église St. Urbain est champenois," says Mons. Viollet le Duc; but is there not in the minds of those conversant with the great "hall" churches of such cities as Münster, Soest, and Erfurt a reminiscence of German when viewing the tall, aisle-less chévet of this church, due presumably to the vicinage of this part of Champagne to Teutonic soil? Several of the Châlons and Toul churches exhibit similar Germanisms.

If as regards its proportions, Troyes Cathedral is hardly entitled to a place among such churches of the first class as Amiens, Chartres, Rouen and Rheims—its Early Pointed choir desiderating that expansion and dignity which constitutes so noble a feature of those examples—it must, on account of its delicate detail, and the wealth of coeval painted glass, which fills not only the First Pointed windows of the choir, but the Geo-

metrical and Flowing Decorated ones of the nave aisles and clerestory—assuredly be entitled to a very high rank among those of the second.

But it is time to return to the Hotel des Courriers and take a light meal, preparatory to "assisting" at the Morning Offices in the glorious five-aisled cathedral* of St. Peter and St. Paul.

The matutinal Office of Tierce is being chanted *in choro*, as I enter and seat myself in one of an empty collection of chairs, very much at my service. The Office concludes. People have meanwhile begun to take their places for "La grande Messe de dix heures." Ladies are, as usual in French churches, in the ascendant. "Monsieur est catholique, mais il ne pratique pas." What a contrast to Germany, with its churches, such as the Dom at Münster, to take a solitary example, crammed to suffocation at the mid-day "*Sing. Amt.*" A bell tinkles. The six great candles upon the High Altar have been lighted, and the officiant upon whom the duty devolves

* One of the few French churches planned with aisles to both nave and choir, others being Bourges and Paris.

traverses the nave, attended by a little flaxen-haired acolyte, in a crimson cassock and cotta, to perform the aspersions, during which the never-wearying melody to the "Asperges me Domine" is chanted to soft organ accompaniment in the choir. Again the bell tinkles. The great organ at the west end flourishes in the key of D minor. A crucifix, flanked by a pair of candles, gleams in the dusky, southern choir aisle, and in honour of St. Loup—he who with St. Germain l'Auxerrois rid Britain of Pelagianism—a procession circumambulates the choir, chanting to a memory-haunting Gallican melody, one of the sublimest hymns in the range of mediæval psalmody:—

Iste Confessor Domini, colentes
Quem pie laudant populi per orbem,
Hac die letus meritis beatus
Scandere sedes,

a hymn whose irregularity of metre has precluded its rendering into truly elegant English to suit the plain song melody. The compilers of the "Hymnal Noted" in the early days of the ecclesiological revival attempted it, but their translation has the brilliance yet stiffness of a gem, while the verses of the Latin poet resemble the soft dewy freshness of a flower.

Between each verse the player of the great organ at the west end of the cathedral takes up the strain and improvises upon it in a manner thoroughly French. Sometimes the tones of the instrument shake the pavement beneath our feet; sometimes they seem full of passionate pleading, and anon, they trip measurefully along, or flash out in sudden brilliance, like a fountain springing upward and tossing the sunlight from its myriad drops.

The Introit having been sung, the organ breaks out again in delicious interludes between the severe simplicity of the Plain Song Kyries—suggesting the contrast between Corinthian and Doric, or between Flamboyant and Lancet.

The music this morning is what is known to us as the "Missa de Angelis," wherein occurs one of the most beautiful pieces of Plain Song writing I know, viz., the Amen at the conclusion of the Credo. The ritual throughout befits the dignity of such a cathedral as Troyes. All adjourn to the nave for the sermon, whose rapidity of delivery precludes my comprehending very much of it, so I allow my thoughts to vagabondise about the noble clusters of shafts with their narrow, delicately foliated capitals belonging to the nave arcades and recalling those on the south side of the nave at Worcester; or about the Flamboyantly traceried aisle windows, wherein the *fleur-de-lys* figures very conspicuously; or I dwell upon the rose which terminates either transept. But the discourse must have had a spiritualising effect, for a rich vein of copper lined the alms-bags when one of those *instrumenta* was duly handed to me by a suave, surpliced canon, and a second by a little girl preceded by a gigantic *Suisse*, a damsel whose dress was really so very *bouffée* that I quite trembled for the propriety of her appearance. Coppers, too, were rained down from hands *bien gantées* into the tin mugs of beggars who, Continental fashion, infest the principal approaches to this cathedral.

The afternoon is spent in again attending the Cathedral service. This time I take a chair in the *pourtour* of the choir, and feast upon the glorious painted effigies of saints in the clerestory windows, large ones of two unfoliated lights with a cusped circle in the head of each. "Iste Confessor" is again sung; this time as office hymn to "Magnificat." Then comes a delightful stroll through the fields, forming the vast environing plain, bounded in the distance by a range of hills, which, under the conditions of sunlight at this time of day, wore a lovely violet hue. Inspection of sundry old village churches, which, with their countrified fittings, are a perfect revelation to the ecclesiologist, diverted the walk very agreeably, and as darkness falls, Troyes is regained while the curfew rings from a large, plain Flamboyant church, whose interior seen at this hour wears an appearance truly awful and impressive.

Next day I am at Châlons, en route for Rheims, Soissons, Laon and St. Quentin, to all of which I may advert in a future issue.

SENS: THE CATHEDRAL, LOOKING EAST.

SOUTH SIDE OF THE ABBEY CHURCH AT PONTIGNY.

IN THE HARTZ DISTRICT.

AN EASTER SKETCHING
RAMBLE.

BY G. A. T. MIDDLETON, A.R.I.B.A.

I.—THROUGH HOLLAND TO HANOVER

USUALLY, when taking a rail or steamboat journey, one's object is to do nothing but to let the time slip by unheeded. When out upon a sketching tour, especially when travelling through country which is new to one's self, it is very different. Every sense is alive, and everything seen which is different from the ordinary is noted. Thus it was with me, in a recent journey across Germany, for though the route was one well known to English travellers, it was fresh to me.

I had elected to travel by way of the Great Eastern—the Harwich route—liking its directness, its comfort, and the opportunity it gives for a good sleep on board; so that I was landed at the Hook of Holland exceedingly early one morning, and was travelling for many hours through the land of the Dutchman, and a prim, well kept, well cultivated land it is. It was early spring, and the hyacinths were in blossom; which means that the fields in many places had the appearance of carpets of rich colour. But it was not the fields nor the straight canals and equally straight avenues of trees, nor the countless windmills, which I had come to see, but rather the buildings, their Architecture, and their construction. Holland, in this respect, was already known to me, as it is known to many English architects, with its wealth of suggestion adaptable to modern English needs, and its extreme poverty of detail. Churches, of course, were passed in plenty, with towers generally more curious than beautiful, and late Renaissance in style; but a long lancet belfry window in one of them seemed worthy of at least passing record, with its simple, yet effective tracery, deep set in the brick walls. This was also the case with two simple methods of placing an octagon on a square, neither of which, however, was wholly satisfactory, while a crenellated water-gate clearly deserved much more careful attention than could be given to it from a train which at the

time when it was passed, was travelling at some thirty miles an hour.

At Osnabrück all the passengers had to alight, and some pleasant travelling companions, who were going north through Bremen, were parted with. One of these, an engineer, had strongly advocated the use of the camera by land surveyors, saying that for mapping purposes he believed it was quite as accurate as the plane table, with the advantage of giving the topography as well as the plan. He spoke of placing it upon a known station, determining its direction, and taking view, including two known stations also in the view, when, the focal length of the lens used being also known, it would be quite easy to lay down the relative positions of all other points seen. Another way in which he had employed the camera when surveying had been as a camera-meida, putting a piece of thin tracing paper upon the focussing screen of ground glass, and sketching on it the outlines of mountains peaks.

At Osnabrück there was time to wander into the little town, but except for the church this seemed to be entirely devoid of interest. Even the church possesses no very remarkable features, but it groups well when first seen, and the vaulting of the interior is massive and dignified, of a simple early Gothic, almost Romanesque, type unknown in England.

Even before Osnabrück had been reached, the typical half-timber work of Germany, of which so much was to be seen during the next ten days had come in evidence. The farm-houses were single-storied, large wide-spanned houses, with steep tiled roofs, and at first the timber was rectangular only, and the chimneys short and with a covering cap over to prevent down blow, just the apex of the gable at either end would, perhaps, be filled with diagonally crossed timbering, or might be tilling, or even hipped-backed; while the plaster filling between the timbers would often be coloured blue, affording a curious contrast with the bright red of the Italian tiling.

Some of these houses were in course of erection, and from them it appeared that only one end of each was used for dwelling purposes, the rest, under the same roof, being apparently devoted to the stables and the barn; while the wide span roof was supported by a row of posts, separating the width into a semblance of the nave and aisles of a church, these posts carrying a plate or purlin.

Shortly after passing from Westphalia into Hanover, through the "Gate of Westphalia"—a pass between low hills thought much of in this great plain country—the gables of the timbered houses became customarily filled with a tile-hung hood, a most eccentric looking feature serving no apparent purpose, though somewhat picturesque, it being remembered that the tiles in use everywhere are Italian tiles, whether for roofing or for hanging.

It was too late when Hanover was reached at length for anything to be seen of it except that it was a well built modern town. So the comforts of the Hotel Bristol were chosen in preference to a night tour of inspection round the town.

(To be continued.)

THE Urban District Council of Romford is erecting public swimming baths from designs by Messrs. Harrington and Ley, of 108, Fenchurch Street.

THE corner-stone of the new English church at Lucerne, which is being erected by the Colonial and Continental Church Society, was laid recently.

NEW elementary schools are about to be erected at Wood Green, according to the designs of Mr. G. E. T. Laurence, 181, Queen Victoria Street.

THE working of the municipal electric trams at Dover has been so successful during the last six months that the Corporation have been enabled to reduce the town rates by 2d. in the pound.

PLANS for the reconstruction of the interior of South Queensferry Parish Church have been prepared by Mr. McGregor Chalmers, architect, Glasgow, and have been approved of and signed by the Presbytery, heritors, and Kirk Session.

A NEW and improved design of a first-class corridor sleeping car has just been placed on the West Coast railway route between Edinburgh and London. It is one of several that have been or are being built at Wolverton for the London and North-Western Railway Company, and looks a perfect piece of workmanship in every particular; nothing apparently having been left undone to secure the utmost comfort and convenience. The furnishing, upholstering, and decoration of the car are on an elaborate scale, white wood panelling, inlaid with walnut, being a conspicuous feature.

M.T.

SKETCHES AT THE ART METAL WORK EXHIBITION AT THE ROYAL AQUARIUM.

ART METAL WORK.

EXHIBITION AT THE ROYAL
AQUARIUM.

[BY A SPECIAL CORRESPONDENT.]

THE exhibition of metal work now being held at the Royal Aquarium serves well to show what advances have been made in English ironwork during the last few years. After the wonderful work left to us by last century's workers, by Jean Tijou and Huntingdon Shaw at Hampton Court, by the craftsmen who executed the gates and railings of many a Chelsea house, and by the examples of cast work turned out from the old Sussex foundries, it seems strange that the art of the smith should have fallen to so low a degree during the first half of the present century that even now we seem to be at about the same position in which we stood a hundred years ago. The present advance is, perhaps, largely to be attributed to such men as Norman Shaw, George Devey, Ernest George, and a host of younger men. The exhibition will show that manufacturers have at last awakened to the fact that a demand exists for better class workmanship and design. It is especially gratifying to see cast-iron work losing the wrought-iron appearance which so many designers have hitherto given it, and in the wrought metal work there is happily a great tendency to realise the value of a sympathetic treatment of the colour of the metal.

It is unfortunately impossible at this early stage of the exhibition to go very fully into the Loan Collection gathered together principally in St. Stephen's Hall, owing to the lack of a catalogue, which we believe, however, will be published in the course of a few days. The greater part of this collection consists of examples of the armourer's art, which will doubtless appeal to many. Rarely, indeed, have we an opportunity of examining so good a collection which, though small, contains some of the most valuable suits of armour extant. Her Majesty the Queen has graciously lent three magnificent suits, which belonged to Henry, Prince of Wales, Edward VI., and the Earl of Essex, together with five plaques recently unearthed at Kew. The Duke of Norfolk lends the chalice of St. Thomas à Becket; the Duke of Westminster five magnificent suits of armour; and amongst other exhibits are a Gothic fluted suit lent by Lord Zouche. A very fine collection of gun and pistol locks lent by Major Farquharson, a Henry VII. helmet from the Very Rev. the Dean of Westminster, a well selected

collection of suits of armour from the Middle Temple, including some very fine shields, and a magnificent breastplate; Highland swords and dirks by Lord Archibald Campbell, a sallet of the fifteenth century lent by the Mayor of Coventry; pistols and daggers by Sir Noel Paton, a fine chamfron, a full suit, and some exquisite stirrups and bit, the property of Major Williams, a remarkable collection of early swords, including a Viking sword of the twelfth century, inlaid with gold and copper, found in the bed of the Thames, a

carved figure of a foot soldier of Francis I. period in the costume and armour of the "Bandes d'Picardie," some early swords lent by James F. Sullivan, a fine case of weapons, and an early sixteenth century suit, from O. J. Whavell. Mr. Percy Macquoid has several exceedingly fine exhibits of steelwork. In the gallery adjoining St. Stephen's Hall is a collection of cast-iron firebacks, mostly of the sixteenth and seventeenth century; and there are also some fine examples of firedogs and iron rests of varying date, but all well worthy of close inspection. The exhibits of old wrought-iron work are not so numerous as we should have wished, but these few are of no inconsiderable interest. Mr. Geo. C. Haité exhibits two iron crosses, in one of which the shaft of the cross is attached to its wooden pole by means of rings, instead of the more modern method of bolting.

In the Industrial section of the exhibition there are forty-six stands, included among which are exhibits of wrought-iron, cast-iron, Repoussé work, electric light fittings, and casements. Amongst the wrought-iron work, Messrs. Starkie Gardner's three stands will claim attention. Their pair of entrance gates, of which if we recollect rightly, we have admired the drawing in last year's Royal Academy Exhibition, are particularly interesting both as regards design and workmanship, the latter will compare very favourably with Jean Tijou's best work at Hampton Court. This firm have also exhibited a collection of balcony and other panels in wrought-iron, wrought-iron screens and many miscellaneous examples of art-metal work, together with another very handsome pair of entrance gates, besides that already noticed.

In stand No. 18, Messrs. Ashford and Butler exhibit some wrought-iron panels, small in detail, though of very elaborate and careful workmanship, a swing mirror, grilles, lamp brackets, and an iron clock to hang on wall.

Messrs. Lindsay, Neale and Co., exhibit a

Iron Company.

C.H.S.

SKETCHES AT THE ART METAL WORK EXHIBITION AT THE ROYAL AQUARIUM.

ART METAL WORK EXHIBITION: CAST IRON FIREPLACE,
EXHIBITED BY THE FALKIRK IRON COMPANY.

pair of wrought-iron gates which would have been better perhaps if seen unpainted. This firm has long been known for the excellence of their constructional iron and steelwork, which, unfortunately, hardly comes under the heading of art metal work in this country, although our neighbours across the Channel for years past have considered constructional ironwork well worthy of decoration, both in form and colour.

Messrs. Thomas Potter and Sons, of Oxford Street, exhibit a balcony and gates of the beginning of the eighteenth century, the property of H.R.H. Princess Louise, a wrought-iron cabinet, some iron and bronze fire dogs, an interesting collection of locks and keys, together with some iron panels, grilles, &c.

It is, perhaps, in the exhibits of cast-iron work, principally fire-places and mantels, that we find the greatest studies have been made, and all architects will do well to visit the stand of the Falkirk Iron Company in the North-west Gallery. This firm have done well in securing the services of several well-known designers, and the results are highly to be commended. In the two designs of cast-iron fireplaces which we illustrate, a distinct departure from the ordinary will be observed, the design is also rendered more pleasing from the fact that the imitation of wood construction, which hitherto appears to have been considered so indispensable, is here entirely eschewed. The suitability of cast-iron when properly designed for the purposes of fire-places, and as giving effects which probably in no other material could be produced at anything approaching the cost, is here well demonstrated. The Falkirk Company have also some good exhibits of cast-iron railings cleverly designed, and in no sense imitations of wrought-iron work, a mistake unfortunately so much made, more especially in railings.

The Carron Company have an exhibit principally of interior grates, many of them of genuine eighteenth century design, the original models of which, executed at the Carron Works between 1780 and 1800, have recently been again brought to light, a very curious example of the trend of fashion to the work of the Georgian period, so noticeable in recent years. This Company was established in 1759, and ranks among the oldest and largest ironfounders of Great Britain.

In the South Gallery the Coalbrookdale Iron

Company exhibits a good selection of cast-iron and bronze work, principally in grates. One very quaint design we reproduce here. This firm is perhaps very largely responsible for the Renaissance in cast-iron work of recent years, and they have been fortunate in securing some very fine designs from Norman Shaw downwards. We were particularly pleased with a little grate enclosed within a frame of poppies (the flowers being in bronze), a very good idea, which we do not remember having seen elsewhere.

Amongst the exhibits of repoussé work those of Mr. Edgar Simpson, of Nottingham, will claim particular attention. His productions are good, in that they emphasize what appears to us a most vital point in dealing with metal work successfully, namely, the importance of considering the colour tones. We recently had the pleasure of seeing a collection of his bell pushes, in the treatment of which he is very successful. Mr. Simpson also exhibits an Elizabethan frieze in repoussé copper.

Amongst the casements exhibited, those of Messrs. R. E. Pearse and Co. will claim attention on account of their excellent finish. An old-established firm, they have for many years been turning out very high-class work, and have devoted their attention more particularly, with a very good result. We illustrate a fanlight arranged for an electric lamp, which

forms a good example of the lead-light work executed by the firm. We also noted an improvement in the hanging of casements, by means of which it is rendered possible to clean both sides of the glass from within, the casement being attached to the frame by a pivot about 4in. from the end, instead of at the end of the frame.

The Central School of Arts and Crafts have an interesting exhibit of cast lead-work, including a very quaint rain-water head ornamented with thistles.

Messrs. Henry Hope, of Birmingham, have a good exhibit of their casements, as well as some very quaintly designed lead light work.

Messrs. Burt and Potts, of Westminster, exhibit gun-metal, and wrought-iron windows and casements.

The N. A. P. Window Company have a large and interesting exhibit on the ground floor, principally of their well-known windows. Amongst other novelties they show a very ingeniously concealed window-stay, suitable also for French windows which provides for holding the casement open at various angles; they also exhibit their wet and draught excluder, with condensation channel for outward opening wood casements and doors, which will supply a long-felt want; they have a very good idea in their airtight centres for casements, which apparently form a joint completely protected from wind and wet. The N.A.P. Company have recently secured the co-operation in their

art metal department of Mr. Geo. C. Haité and are exhibiting many of his designs for wrought-iron.

At stand No. 9, the Tayler Smith Electric Company exhibit a magnificent piece of smiths' work, of vigorous and pleasing design, executed for the Scottish Conservative Club, Glasgow, together with many other specimens of wrought work, which renders this stand one of the most interesting.

Mr. George Wragge, of Manchester, shows one-half of a very beautiful and characteristic pair of gates, designed by Edgar Wood, together with some repoussé dishes and several commemorative tablets.

Mr. J. E. C. Carr, of Manchester, has some very quaint hanging lamps in brass, as well as some repoussé panels.

Messrs. Perry exhibit many of their reproductions of famous models of chandeliers, &c., from French Palaces of the Louis XIV., XV., and XVI. periods, the Italian Renaissance, &c., now adapted for electric light fittings.

The A.A. Window Company exhibit their patent sashes, which render the cleaning of windows far safer and simpler than the ordinary methods of hanging.

Messrs. Strode and Co. have a good show of their electric fittings, together with several wrought-iron dog grates, and, in the centre of their stand, one of a very handsome pair of Louis XVI. gates. We also noticed a delicate piece of ironwork made up as a screw. In their newel lights, and also their electroliers, they are particularly successful.

Messrs. Miller and Sons, of Piccadilly, have a very handsome stand of electric light fittings, mostly copies of old models in brass and iron. They have several electric light brackets in what is technically known as "armour finish." This finish, when, as in the present case, it is not over lacquered, has a particularly pleasing effect, especially as it allows the tool marks to be in evidence.

Mr. W. Soper, enameller and enamel painter, of Clapham, exhibits a case of champeve cloissomé and other enamels, very brilliant in colour and effective. He also shows several miniatures painted on gold, which also forms a background.

The list of awards made in connection with the designs competitions is officially supplied as follows:—

No. 1.—No award.

No. 2.—Silver medal: V. Shaw, 105, Hunger-

ART METAL WORK EXHIBITION: CAST IRON FIREPLACE, EXHIBITED
BY THE FALKIRK IRON COMPANY.

ford Road, London, N. ("St. Eloë"). Bronze medal: G. Ramsdale Tucker, Hazlemere, Green Lane, Northwood, near Rickmansworth ("Tuclarke"). Certificate: Hugh Stirling, 12, Vauxhall Street, Dudley ("Reversible").

No. 3.—No award.

No. 4.—Bronze medal: Herbert C. Maw, Severn House, Coalbrookdale, Shropshire ("Utility").

No. 5.—Silver medal: T. R. Spence, 28, Newman Street, London, W. ("Munser"). Bronze medal: Arthur Manock, Benfield House, Boscombe Park, Bournemouth ("Practical").

No. 6.—Silver medal: A. Harold Smith, 4, Fairlop Road, Leytonstone, Essex ("Wessex"). Bronze medal: Chas. R. Warren, 17, Pepper Street, Chester ("Hindoo").

No. 7.—Bronze medal: Albert Waldron, 21, Russell Road, Bowes Park, London, N. ("Heron"). Certificate: Herbert W. Doe, 30, Speenham Road, Stockwell, S.W. ("Nature in Art").

No. 8.—No award.

No. 9.—No award.

No. 10.—Certificate: Charles William Crosby, Broome Hurst, Dorking Norrey ("Appollyon").

No. 11.—Silver Medal: R. Quilter Lane, 73, Hammersmith Road, West Kensington ("Anchor"). Bronze Medal: Hugh Stirling, 12, Vauxhall Street, Dudley ("Ling"). Certificate: Mary Gondir Simpson, 199, Camberwell Grove, Denmark Hill ("Bulger").

No. 12.—No award.

No. 13.—Silver Medal: A. Harold Smith, 4, Fairlop Road, Leytonstone, Essex ("Wessex"). Bronze Medal: Herbert E. Maw, Severn House, Coalbrookdale, Shropshire ("Bull Rest").

No. 14.—Bronze Medal: A. Harold Smith, 4, Fairlop Road, Leytonstone, Essex ("Wessex").

No. 15.—No award.

No. 16.—No award.

Awards for craftsmanship have been made as follows:—Bronze Medals and Certificates: F. G. Francis, 33, St. Michael's Street, Folkstone; R. Western, 5, Bravington Place, Harrow Road, W.; A. W. Elwood, 9, Kennington Park Gardens; Annie Williams, 334, City Road, E.C.; Central School of Arts and Crafts, 316, Regent Street, W. Certificates: Thomas Taylor, 16, Sales Street, Pyr Bank, Sheffield; William Steer, 64, Longhedge Street, Battersea, S.W.

We regret that want of space does not permit us to notice more fully the many other excellent exhibits shown among other firms by Messrs. Barkenter and Krall, Brail Colbran and Co., Mark Feetham, and Messrs. Charles Smith and Sons.

MR. W. A. DUCAT has held an inquiry at Truro on behalf of the Local Government Board upon an application for sanction to borrow £1250 for works of paving.

THERE appears to be a slump in frescoes. The remarkable pictures which were alleged to have been painted 400 years ago by Bernardino Luini on the walls of the Oratory of the Church of St. Ambrogio, Milan, have been put up to auction by Messrs. Foster in Pall Mall, but sold for small prices.

It is almost certain that the proposed new station on the Metropolitan Railway between King's Cross and Farringdon Street will be made, the Company having prepared plans for it, by which it appears that the construction would not involve any very heavy engineering works. The situation of this new station will be where the Farringdon Road and Rosebery Avenue cross one another.

THE President and Committee of the John Carpenter Club—which is composed mainly of "Old Boys" of the City of London School—gave a conversation at the Guildhall last week. A collection of manuscripts, early printed books, and artistic works of interest, selected by Mr. Charles Welch, the librarian, was exhibited in the library, as well as the William Rome collection of ancient bronzes, &c., the Nelthropp collection of ancient watches, and charters and books from the town clerk's department.

AN OLD YORKSHIRE CHURCH.

DISCOVERY OF A HIDDEN AISLE.

THE ancient church of St. Helena, in the village of Austerfield, near Bawtry, has just been restored. That great improvements and alterations were necessary was apparent more to those who worshipped in the old church than those who visited Austerfield to inspect the ancient building. To commence with, the seating accommodation has been increased; it came about in rather a surprising and unlooked-for way. "The wall on the north side of the church, to all appearances, was similar to that on the opposite side—solid, and of great thickness—but when the

MASONS COME ON THE SCENE

with their hammers and picks, it was found that it was hollow, and that inside were substantial pillars supporting arches, which no doubt some centuries ago formed the side of the north aisle. It is supposed—in fact, those who are authorities on the matter say it is true—that originally the church possessed an aisle on the north side, but this falling in some time during the fourteenth century, the church was decreased in size by using the material which had given way for making a new wall, which was the one recently demolished and which hid the pillars. Those in charge at the present time have seized the opportunity thus offered of enlarging the church, and the pillars once more divide the edifice, and cause

THE LONG-FORGOTTEN NORTH AISLE

to accommodate some fifty additional persons. This has necessitated a new wall being built on the north side, and it has been made as nearly as possible like the other walls surrounding the church. The cost of this, the most important feature of the alterations, has been subscribed by the Society of Mayflower descendants in America. The interest of the members of this Society in the church is no small one, for one of the original Pilgrim Fathers, William Bradford, was born in the village of Austerfield, and was baptised in the old Norman font, and a register recording this fact is, we believe, still in existence. The other alterations have included the provision of a new floor, the taking away of the old box pews—which supplanted those of carved oak in 1835—the removal of the old shattered roof, and the provision of a new red tiled one in its stead. Various new windows have also been placed in the church, repairs have been done wherever necessary, and the interior has been completely decorated and renovated. The total cost has been something like £2000. That the edifice is an old one will be seen by the reference to William Bradford's baptism. It was built, as far as can be ascertained,

IN THE YEAR 1130,

by one John de Binsly, and since that time there appears to have been no real effort made on any occasion to renovate or improve the building. Thus time has wrought a great change in what was once a handsome Norman structure, and although many traces can still be seen of the ancient beauty and the old-time work of the church, the recent alterations have arrested somewhat the increasing marks of old age, and have made the church more comfortable and more pleasing to look upon by taking away those features which for centuries past have marked Austerfield Church as a prominent one to all and sundry who have visited the village.

THE Board of Trade have issued provisional orders to the Vestry of Bermondsey and the Vestry of St. Marylebone, empowering these bodies to supply electricity "for all public and private purposes" throughout the whole area of their respective districts.

MR. THOMAS G. MILNER, writing from the Town Hall, Hull, states that the figures quoted by the Chairman of the Finance Committee as to the proposed series of city improvements were £600,000, and not £6,000,000, as was stated in some of the reports.

KEYSTONES.

THE repairs to the Marquis of Salisbury's house in Arlington Street have been completed. A commodious new police court at Castleford has been opened by Sir John Austin Bart., M.P.

BLACKPOOL CORPORATION has applied for sanction to borrow £40,000 for the purposes of electric lighting.

THE inquiry into the application to construct tramways in Hastings has closed, the Railway Commissioners refusing their sanction.

THE children's portion of the new Home for Cripples and Afflicted Children, which has been erected at Bournemouth, has been opened.

THE Prince and Princess of Wales and the Duke and Duchess of York recently paid a visit to Shernbourne Church, and inspected the work of restoration, which is now nearing its completion.

THE Lord Mayor of Birmingham has laid the foundation stone of a new wing of the Midland Counties Hospital for Incurables at Leamington. The extension is part of a scheme involving an outlay of £17,000.

THE Board of Trade has issued a provisional order to the Urban District Council of Barnes, empowering them to supply electricity throughout the whole of the area within their jurisdiction, but excluding Hammersmith Bridge.

IN Birmingham at the corner of Church Street and Bread Street stands a forlorn-looking building, whose unwashed stucco front suggests the architecturally shabby-genteel. It is the old Red Lion public-house, a building which if stones had tongues could tell the history of Birmingham for more than a century back. It is about to be demolished.

THE City Corporation has succeeded in obtaining power to make a minor, but still important, street improvement. A part of the old churchyard formerly attached to the Church of St. Peter, West Cheap, at the corner of Wood Street and Cheapside, is to be thrown into the thoroughfare to widen Wood Street at a point where the traffic is greatly impeded.

AFTER many years of agitation, Dunoon, the popular watering-place on the Clyde, has got its new pier. The works include a concrete sea wall about 300yds. long, surmounted by an ornamental iron railing. The pier head is 440ft. in length and 60ft. in width, while the gangway forming the connection with the centre of the pier head is 170ft. long and 40ft. wide. Exclusive of the waiting-rooms—which are the finest at any Clyde coast resort, and have cost an additional £3000—the new pier incorporating the suitable part of the old structure, has cost £15,000.

THE extensive alterations which are being effected to the interior of the Liverpool Town Hall are progressing satisfactorily, but some considerable time must necessarily elapse before the building is out of the hands of the workmen. Much of the beautiful mahogany and tile work in the corridors is completed and just now the men are engaged in enhancing the appearance of the ceilings on the ground floor. Still, when this is finished, the decorators will take possession of the building and, as it is intended to expend upwards of £3000 on beautifying alone, it will be seen that the task must occupy a lengthy period.

THE well-known Italian archaeologist, Orazio Marucchi, has recently discovered an ancient papyrus in a secret repository at the Egyptian Museum of the Vatican. The papyrus consists of two fragments written on both sides, and containing a series of philosophical maxims written first in Greek and afterwards translated into Coptic. Unfortunately, the beginning and the end of the papyrus are wanting, so that it is impossible to decide its length. Professor Krall, Professor of Coptic at the University of Vienna, is of opinion that the papyrus is one of the oldest Coptic papyri yet discovered, and that it belongs, probably, to the fifth century of our era. As every Greek sentence is followed by a Coptic translation, it is supposed that the fragment just found belonged to an ancient scholastic book used in Egypt. The document will soon be published in facsimile.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
June 15th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slat; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

It is stated that the Queen will probably lay the foundation-stone of the new front of the South Kensington Museum some time in July. It is also stated that a suggestion that the name of the museum should be changed from its present official designation, which is thought to be of too local a nature, to a title more in accordance with the national character of the institution, has been favourably entertained in high quarters.

THE thanksgiving window has been finally put in its place at the western end of Hawarden Church. It is a beautiful window, with the Nativity for its subject, and it has been reproduced from the designs of Sir E. Burne Jones by Messrs. William Morris. The window had been intended as a thanksoffering for the two lives which had been spent for so many happy years together in Hawarden. It must now be regarded as a memorial window. Its design scarcely needs explanation—its sweet-faced Madonna, its shepherds, and the kings who brought gold and frankincense and myrrh explain themselves. The colouring is characteristic of Sir Edward Burne-Jones's work, and Messrs. Morris have reproduced the colours with admirable fidelity. The silvery tones of the attendant angels are especially beautiful.

In most civilised countries historic buildings are under the care of the Government or of the local authorities. In England they are left to the charity of private individuals, and the marvel is that the antiquarian zeal and reverence for the past, upon which such heavy demands are made, so often prove equal to the emergency. A venerable structure which is now recommended to the liberality of the British public is Croyland Abbey. In order to a cure the fabric, it has become necessary to underpin the north wall and rebuild some other portions, and the Rev. T. H. Le Boëuf, rector of Croyland, appeals to all readers of Charles Kingsley, all members of Cambridge University, of which Croyland Abbey was, he says, the "nursing mother," and to the various societies devoted to the study of architecture, archaeology, and kindred subjects, for help to raise the sum of £3180 which is needed. From so wide a constituency there ought not to be much difficulty in procuring the comparatively small amount which will suffice to preserve for posterity an interesting relic of the "ages of faith," and of a picturesque period of English life.

THE Champs Elysées, that lovely promenade and lounge, is being rapidly transformed into a busy thoroughfare. The Chateau des Fleurs has disappeared, and in its place is a big hotel; on the south side the beautiful old residences with gardens are being replaced by magnificent lodging-houses. The superb hotel of Queen Christine is all but sold by its present owner, the Duchesse d'Uzès, and the price, rumour

says, is eight millions, as it runs far back into the Rue de Ponthieu. The adjoining one, with its lovely garden, will also go should an ancient relative join the majority; but saddest of all is the destruction of the beautiful Wilkinson Hotel, especially built to house the celebrated doors and windows from Marly le Roi and the Chateau de Bercy, and the doors, by-the-by, owe their marvellous preservation to the fact of having been bought at the Chateau auction in 1893 by the local baker to make flour-bins! The widow of the late Mr. Charles Wilkinson, finding the Champs Elysées no longer the pleasant abode it once was, has accepted a huge sum for her palace; and the English house of Duveen have secured the contents of the Wilkinson Hotel from under the very nose of the Paris dealers, so that the admirable Marly doors, Bercy Chateau panels, and the celebrated "Cire perdue" bust of Louis XIV. and other superb objets d'art are coming to England, while the beautiful Wilkinson Hotel is razed to the ground, and yet another enormous apartment house is to be erected in its stead.

A PICTURE of considerable interest to art collectors and the public generally will shortly be offered for sale. The title of the picture is given as "The Archbishop's Palace, Lambeth," and it was the first drawing exhibited by Turner at the Royal Academy. In the catalogue of 1790 it appears as being the work of "J. W. Turner, Maiden Lane, Covent Garden." Thornbury, in his "Life," refers several times to this early drawing, stating that it "is now in the possession of Miss Dart, of Bristol." Miss Dart was a niece of Turner's old friend, John Narraway, and the drawing remained in her possession until 1868, afterwards passing out of her hands. The picture next came into the hands of a Mr. Courtault, of Baintree, in whose hands it remained until his death, which took place some six years ago, when his effects were sold, and most of his pictures came into the possession of a local furniture dealer.

THIS man, who in all probability had never heard of Turner, put the picture away among some old lumber at the back of his shop; the present owner, seeing some pictures in the window when passing, went in and turned over the whole stock, with fruitful results. The picture was recently sent to Messrs. Vokins for reframing, and they discovered a record of having framed it in 1868. The writing on the picture is quoted in part in the "Life of Turner," and the age of the artist is commented upon. The full inscription, which was been protected under glass at the back of the frame, is "The Archbishop's Palace, Lambeth (London), done by J. M. W. Turner, when a lad about sixteen or seventeen years of age; his first picture in the exhibition at Somerset House, and afterwards given by himself to his old friend Mr. John Narraway, of Broad Road, Bristol, about the year 1790 or '91." Double interest attaches to it as being not only the first Turner exhibited on the walls of the Academy, but also a pictorial record of a great historic building, as it appeared in the closing years of the last century.

THE report of the Director of the National Gallery for 1897 chiefly takes the form of a first-class catalogue of the pictures which now hang in the Tate Gallery at Millbank, for all these are enumerated and described in an appendix "respecting bequests and donations." Besides these pictures the National Gallery has acquired, "Christ Disputing with the Doctors," by Ludovico Mazzolino, "Portrait of Edmund Butts," by John Bettes, "Portrait of Mrs. Mark Currie," by George Romney, and "Portrait of the Artist," by Madame Vigée Le Brun. The Romney cost £3500—Romney himself got sixty guineas for it; the unearned increment can only count to him for glory. The most noticeable thing in the report next to its description of the pictures is the constant complaint concerning want of room. The National Gallery appears to have been honestly relieved to have found in Sir Henry Tate's Gallery a place where it could deposit the superabundant pictures of the British

school. The transfer from the gallery in Trafalgar Square of ninety-one pictures by British painters born after 1790 to the gallery at Millbank has permitted all the remaining examples of the British school to be placed in the western wing of the building in Trafalgar Square without crowding; and in many instances the pictures are seen to better advantage than before. Other advantages gained by the new adjustment have been the possibility of putting the Spanish pictures at last in a good light, and of securing a separate room for works of the German school, hitherto grouped with early Flemish pictures. But the cry for more space is not yet appeased.

THE ARUNDEL SOCIETY applied for permission to deposit at the National Gallery 181 additional drawings from works by Old masters in Italy and other countries, but the National Gallery, while acceding to the request, have not been able to find space in which to exhibit the drawings. Even at Millbank they are waiting eagerly for the ten new rooms which Sir Henry Tate has promised to build, and until the rooms are finished the G. F. Watts pictures will have to be distributed about the present rooms instead of having a room to themselves. The gallery in Trafalgar Square was visited by 423,421 persons on the free days during the year, showing a daily average attendance on such days (206 in number) of 2055. In addition to this number, 32,876 persons visited the gallery on the twenty-six Sunday afternoons on which it was opened during 1897, showing a daily average attendance of 1265. On students' days (Thursdays and Fridays) 39,358 persons were admitted between the 1st of January and the 31st of December, 1897, the admission fees (at 6d. each) amounting to £983 19s., as compared with £1064 10s. received in 1896. The Gallery of British Art at Millbank was visited by 104,275 persons on the public days, from the 16th of August to the 31st of December, showing a daily average attendance of 1337. On the six Sunday afternoons on which it was opened it was visited by 19,955 persons, showing a daily average attendance of 3326. On students' days 15,795 persons were admitted between the 16th of August and the 31st of December.

THE Dean of Bristol, in a letter to a local contemporary concerning the restoration of Bristol Cathedral, gives some account of the work already done. He says:—"Up to the present date the following works have been completed by Messrs. Cowlin, under the direction of the late Mr. Pearson: Central tower, Lady Chapel, cloisters, choir roof, parapets of south choir aisle and eastern end of choir, the northern, eastern, and southern bays of the eastern Lady Chapel, the last bay of which is now being completed. Every passer-by cannot fail not only to notice how much the restoration so far covers, but to recognise also the improved appearance of the cathedral itself. There remain the following works and the approximate estimate for their completion:—To finish Berkeley Chapel, £620; N. C. aisle, £900; S. C. aisle, £450; Newton Chapel (approximate), £300; roof of Berkeley Chapel, £200; south transept, £150: total £2620.

"VERY few people have any idea of the condition of this portion of the fabric. Very few have occasion, even out of curiosity, to visit the south-western side of the cathedral. It is really no exaggeration to say that it is in a ruinous condition and imperatively requires thorough restoration. It is not a matter of sentiment, but of urgent necessity for the preservation of the fabric itself. It is not creditable that the cathedral of the 'Metropolis of the West,' in the centre of a wealthy community, should continue in this dilapidated state. If I could raise about £3500 the cathedral would be thoroughly restored, and my heart's desire is to see this *un fait accompli* in my closing lifetime here."

CRITICISM on the part of the public has been directed to the draft of the proposed bye-laws for the regulation of lamps, signs, and other structures overhanging the public way within

the jurisdiction of the London County Council. The draft is at the present moment engaging the attention not only of the Building Act Committee, but of the vestries and district boards of the metropolis to whom the suggested regulations have been referred. The aim of the regulations is to suppress as far as possible the elaborate projections which have in recent years been erected over the footways by the proprietors of licensed houses; but, at the same time, certain trading firms who have largely relied upon rows of advertising lamps will probably find that restrictions will be imposed upon their use, but whether to the extent as provided in the draft remains to be seen.

DISCUSSION is chiefly raised upon the clauses in the bye-laws which exact that no lamp, or structure supporting the same, shall be nearer to the carriageway than 3ft. from the outer edge of the kerb, and project more than 4ft. from the main wall of the premises to which it belongs. It is argued that the suppression at the end of twelve months of every lamp which infringes one or other of the bye-laws would entail the confiscation of a vast amount of property which is not a nuisance and an eyesore but, in the majority of cases, an ornament, as well as of benefit to the public in affording additional street illumination to that provided by the public lamps, electric or gas.

FOLLOWING the precedent now some years established, the executive committee of the Silchester Excavation Fund are exhibiting, at the rooms of the Society of Antiquaries, Burlington House, the chief discoveries made last year at the great Romano-British city about ten miles from Reading. The work was actually begun in 1864, at the expense of the Duke of Wellington, and was intermittently carried on for about fourteen years; but it was not until 1890 that the present fund was formed to conduct the investigations in a thorough and systematic manner. Silchester, or Calleva, as it was known in Romano-British days, is unique as illustrative of the civil town life of its days, and among the many other features of interest which have been brought to light there are the evidences of an extensive dyeing industry, a Christian church, probably of the fourth century, and therefore one of the oldest relics of the faith in Europe, temples, baths, and a scheme of drainage. The excavations last summer and autumn were conducted by Mr. Herbert Jones and Mr. Mill Stevenson, and the area explored embraces the 17th and 18th of the insula into which the city was divided, the two covering in all about five acres. Some wooden tubs sunk in the earth as wells were in remarkable preservation, and one of these, over 6ft. in height, had only one defective stave. A very large jar of grey ware, 2ft. high and 22in. in diameter, with painted black bands and incised decoration, was found sunk in a kitchen floor, and was removed almost intact. It is inferred that it was used for the storing of pickled meat. The Samian ware is unusually beautiful, and the bowls show the three types of decoration generally employed in excellent contrast, as the pieces include ornamentation in the Greek scroll, foliage, and spirited animal designs. A small vase is notable both for its graceful shape and medallions with masks. There are also two bronze brooches, with designs carried out in coloured enamels, some lengths of fine chain with hooks and swivels, curiously suggestive of present-day watchguards, and a device in bronze of a well-modelled eagle's head, which probably surmounted a wand of office. The display will be continued until June 15.

THE Parish Church of All Saints, South Leventon, near Retford, has just been reopened after complete restoration. The church is a beautiful building, chiefly in the early English and decorated style, but possesses a fine late Norman doorway (south), with Norman windows in the tower. The arcades are especially grand, and the carved early English capitals of great beauty. An ancient piscina in the east wall of the south

aisle marks the site of a chantry chapel. The chancel was restored in 1867 by the Ecclesiastical Commissioners, but for a long time it seemed an almost impossible task to raise sufficient funds to restore the other parts of the building. The architect for the restoration was Mr. Cotterill Schofield, of 50, Queen Anne's-gate, S.W. The chief work has been the removing of the roof of the nave, aisles, and vestry, and replacing them with roofs at a higher pitch, taking down and rebuilding in their original positions the walls of the nave, aisles, vestry and tower. The south porch has also been removed, and a new one built. The floor of the nave has been laid with wooden blocks on a concrete bed, and a new heating apparatus supplied by the Sheffield Warming Company.

ANOTHER new building collapsed! Happily the consequences of the "accident" in Devonshire Street, Portland Place, were not so terrible as in the recent case at Westminster; but as it was, one man was killed and another seriously injured. In this case, it is suggested that the foundations were imperfect, that the subsoil was largely sand, and that some unsafe brickwork had been left from the demolished old building. The inquest will, no doubt, throw light upon those points; but there can be no doubt, says the *St. James's Gazette*, that the foundations of London houses are often most seriously unsatisfactory. Especially is this the case with the ordinary suburban villa. Look at the foundations as they are being laid, and you will realise that when the house is built it is rather the superimposed weight than the firm foundations which keep it standing. Speaking generally, London building is bad, and it is to be hoped that these repeated collapses will result in greater stringency of inspection.

MUCH discontent and no little alarm have been excited in the boards of electric lighting companies by the action of the Board of Trade in passing orders permitting vestries in London to erect electric lighting plant, in competition with the companies already in the field. It is not merely a case of the Metropolitan Company and the Vestry of Marylebone. Any vestry, it seems, may take up a hostile attitude to the companies operating in its district, and with the help of the Board of Trade, obtain power to establish opposition generating stations and plant.

ABOUT two weeks ago, in taking out foundations near the new dock at Barry, some interesting Romano-British fragments were found. The principal one, writes Mr. John Storr, is a circular fibula, or brooch, of bronze, with the patina in good condition. It measured about 1½in. in diameter, the pin in good condition, and in workable order. The body of the brooch was of bronze, cast, and afterwards filed in a plain pattern, showing about seventy-two little bosses on the front of the circumference, the pin not ornamented in any way. It is only a plain, serviceable article, but shows what was worn as a dress fastening in the Barry, or whatever its name was in the fifth or sixth century after Christ. The other two fragments are probably parts of a bronze torque, or similar neck ornament, which has been broken in the moving or digging out; it seems to have been without ornament of any kind, except a certain amount of twist in the wire-like parts which have been preserved.

THE foundation stone of Glasgow's new School of Art was laid recently by Sir Renny Watson. Lord Provost Richmond, who presided, said that the ceremony marked a red-letter day for the Glasgow School of Art, and an epoch for the city itself. The appreciation of Art in Glasgow, as well as in other manufacturing centres, he continued, had been very slow in growth. The school, in common with similar institutions throughout the country, had had an almost continuous struggle to exist. By the liberality of the Bellahouston Trustees, who had in addition granted a sum of £4000 towards the building fund, a free site, valued at £6000, had been secured. To

this the Corporation added £5000, and through the exertions of Mr. James Fleming and the other governors a further sum of £6000 had been raised, making a total building fund of £15,000. This, however, would not enable the scheme to be completed, a further sum of £10,000 being required.

THE use of electricity in Italy, both for lighting purposes and as a motive-power, is constantly extending, and there is consequently an ever increasing demand for all kinds of electrical appliances connected with this development. Some of these are now made in Italy, but by far the greater part come from Switzerland and Germany, two countries which appear to have made this industry, which has undoubtedly a splendid future before it, quite a speciality of their own, and they must find it a very profitable one. British engineering firms do not seem to be making any effort to secure a share of this business in Italy. In 1899 the centenary of Volta's discovery of the electric pile is to be celebrated in Como, his native town, by an international exhibition of electrical appliances, which will no doubt be most important and interesting.

THE Midland Railway Company intends to erect a great central station on the site of Christ's Hospital. It would, no doubt, be an admirable spot for the purpose; but Londoners will ask themselves how the traffic in that neighbourhood, already busy enough, is to be rearranged. The confluence of the Old Bailey and Newgate Street is a very crowded spot. The Old Bailey is narrow, and receives an enormous amount of heavy traffic, with the consequence that there are frequent blocks. Past Christ's Hospital an endless stream of omnibuses pours from morning to night. What will happen with a great railway station on that spot? Every hour hundreds of cabs would head across Newgate Street to or from the Old Bailey, since we must realise that the terminus of a great line placed in so central a position would speedily become one of the busiest stations in London. From time to time we hear something about the demolition of Newgate. If this railway project is carried out, that demolition will become imperative. The Old Bailey could then be widened to any extent—it is already quite wide at the northern end. But, short of some such rearrangement, a great station in that neighbourhood would be a terrible nuisance.

LORD ALDENHAM having applied for a faculty for authority to complete the work of restoring the High Altar screen at St. Albans Cathedral, the Registrar of the Diocese held a Court at the cathedral for the purpose of hearing objections thereto. It would seem that as long ago as 1884 Lord Aldenham commenced restoring the screen, but when a portion of the work had been accomplished Lord Grimthorpe raised objections to the carrying out of certain of the proposals, and as he possessed a faculty which covered the whole building his objections were upheld. Two faculties were subsequently granted to Lord Aldenham, but he did not complete the restoration, and he now petitions for another empowering him to vary the original design. At the Registrar's Court no opposition to this alteration was made, and his lordship, who has already spent about £10,000 on the screen, will in all probability receive the desired faculty within the next few days.

IN reference to the condition of the atmosphere of the Parish Church of St. George the Martyr, owing to the large number of human remains that lie exposed in the crypt, the Public Health Committee has had samples of the air both in the crypt and the church analysed, and the report is that "it is of normal quality as compared with other metropolitan churches." But this surely does not put the matter in a very much more favourable light. It is generally believed that many of the older churches, especially in London, are anything but healthy. How could they be otherwise, with rotten coffins and decaying human remains lying about beneath the floors?

Hellenism and the Triumphal Arch in Christian Architecture.

By S. J. NICHOLL.

AT the time of the great triumph of the Roman empire, so completely had Hellenism conquered the peaceful Arts that the artistic forms which surrounded the Prince of Peace must have, to a great extent, been Hellenistic, this is evidenced by such works out of Greece proper as the rock excavations of Alexandria as well as by the rock cut tombs of Jerusalem. The Alexandrine work is interesting, not only for its beauty of design, but as shadowing forth a transeptal plan with a broad circular central area having a triple opening into it from what we may call the nave, and domed over, not structurally but in form. The tombs

IN THE VALLEY OF JEOSOPHAT

have similar architectural detail; and of singular interest are the so-called tombs of Absalom and Zachariah as examples of Jewish tombs, cut in the living rock and isolated by the cutting away of the rock around them. They are decorated by architectural embellishments, Ionic columns with the entablature as a cornice, and in the case of the larger one, the tomb of Absalom, with constructional additions, giving the whole at first sight the appearance of an erection; just as Constantine treated the tomb of our Lord. In these small works, as in their great temples, the Greek architects vigorously adhered to the column and its entablature, the glorified post and beam, and this not from ignorance of the convenient arch, but from the appreciation of the traditional forms as consecrated by usage, dignified and

ENNOBLED BY ARTISTIC TREATMENT,

and more impressive to them in the simple idea of repose and stability than was the active, restless arch. The dome, however, was shadowed out, as I have shown, in the rock-cut tombs of Alexandria, 23ft. in diameter, and long before had been constructed in form by overlapping rings in the treasury at Mycenæ. The portico of the Pantheon in Rome was erected twenty-seven years before our era, with its columns, entablature, and pediment, but the structure to which it forms the entrance with its great dome was not erected till the time of Hadrian, who died in A.D. 138. This is proved by the stamps on the bricks used in its construction; it was dedicated by Boniface IV. as a church in honour of the Blessed Virgin and all the Martyrs, but, as I shall show later on, Christian churches had been constructed from an early period in our era circular in plan. The selection of forms, not mainly for economical motives, but for æsthetic and traditional reasons, the

HELLENIC PRINCIPLE OF LIMITATION

or restraint pervades all good Art, and in the most perfect works of mediæval Architecture it is evident in the limitation of the great idea of the verticality, so strongly marked by aspiring arch, by buttress and pinnacle, but which, at the best period, is well restrained by horizontal features, by string courses, and parapets, by the roof, and by the well formed abaci to the capitals of the columns, so that a church of this period gives the idea, not merely of aspiring but of an upward struggle; symbolical of the Christian life. In the decadence the abacus is suppressed, and unrestrained license is given to verticality. It was the same in carved ornament; foliage was very sparingly used in Greek design, and in early Christian work where used is of purely conventional form; later on, when more freedom was given to the artist workman,

NATURAL FORMS WERE SUGGESTED,

evidence of a growing love for natural beauty; but in the decadence all restraint was removed and the wildest vagaries of imitation indulged in. Limitation in architectural construction is still happily to some extent acknowledged, as in the case of the iron girder which in appearance is excluded from our churches when employed to carry flat ceilings or

simulated domes; perhaps in the future it may be ennobled by artistic treatment as has been the arch, which suppressed by the Greek is triumphant in Christian Architecture gradually developed and dignified. In old St. Peter's in Rome the column and beam ruled in the front rank in the nave, whilst the side aisles were divided by arcades; St. Mary Major retains the trabeated colonade of the Ionic order with the regular entablature; whilst St. Paul's outside the walls has semicircular arches supported by columns of the Corinthian order; but all these churches agree

IN ONE GREAT FEATURE,

the triumphal arch, pre-eminent in all great churches erected since the time of Constantine as the entrance to the Sanctuary. Of the earlier incidence or intention of the triumphal arch I have in a previous paper* instanced the basilica in the Ostrian Cemetery, given by de Rossi, in his great work on the Roman Catacombs† as having the triumphal arch well principal marked by projecting piers, in which are formed two niches, corresponding to the two lateral exedrae of some old basilicas in one of which the sacred books used to be kept, and in the other the sacred vessels and all things necessary for the offering of the Holy Sacrifice; the Secretaria and Diaconicum, a rude imitation or continuation of what may have existed in previous structures of a period of peace, and to which I refer again as the type of a series of triumphal arches still existing in certain of our churches; the

CHURCH OF CASTLE RISING,

Norfolk, is one of these; here the western wall of the tower is carried by three semicircular arches, the central and wider one open in the usual manner, whilst the side ones are only recessed to about half the thickness of the wall, directly answering to the recesses in the catacomb basilica, except that they face the people, an arrangement impossible in the catacomb for want of space. The original use of these niches appears to have been changed in the thirteenth century at Castle Rising, when to the recess which I suggest would be the secretarium was added an enriched and purely ornamental pointed arch as a canopy, and a piscina; so that it then became a recess for a side altar. On this point it is interesting to note the erection of sacristies at this period; the sacristy and treasury of Wells below the chapter-house belong to a date between 1263 and 1284, and

THE GREAT SACRISTIES OF LINCOLN MINSTER, works of the thirteenth century, although identical in detail with adjoining work, were evidently commenced separately, as an after thought, required by a change in the ceremonial then taking place. Barfreston church, Kent,‡ so well known to ecclesiologists, has similar recesses in the same position; in other churches the three arches are open, repeating in idea the triumphal arches of the Romans, such as the one Constantine erected with artistic materials from earlier works to commemorate his own victory. These openings may have been fitted with curtains: an Anglo-Saxon ivory in the South Kensington Museum of the eleventh century shows an arch so fitted. This triple-arched idea was not allowed to rest by our artistic forefathers, but was developed into elegant structures, such as that in Stebbing Church, Essex. In this instance of fourteenth century date under one inclosing pointed arch, there is an arrangement of three openings in stonework, cusped and traceried, divided by two graceful shafts; the central portion of the work was shaved down and otherwise mutilated; Buckler says in the fifteenth century, to make way for a more gorgeous wooden rood-screen and loft; certainly in this case a misfortune. The same idea on a larger scale and more elaborately worked out may be seen in the cathedral of Drontheim, in Norway. Here the central portion remains, and has a doubly cusped

arch springing lower down on the shafts than the tracery; just as the Stebbing screen had; terminating in a pedestal, I presume for the rood. Another variety of this triple-arched idea may be seen forming the chancel arch at Wool, in Dorsetshire, near to Lulworth. In this instance the three arches carried by two slender columns rise to an equal height with a horizontal string above them; leaving a tympanum above for the painting. In some of the catacomb churches a beam supplied the place of the arch, as is shown in the beautiful restoration by de Rossi in the Crypt of the Popes in the cemetery of Callistus. In old St. Peter's they had the constructional triumphal arch as well as the trabeated screen; the beam idea is preserved to us in St. Mark's, Venice, and in our own mediæval churches we know how beautifully the Roman tradition of both arch and beam was continued in the chancel arch and rood-screen. I have followed out this triple arrangement in the chancel arch from the little catacomb basilica, 7ft. wide, to its full development in the choir entrance of Drontheim Cathedral; rather because this idea has not been so fully described, or perhaps so well-known as the great triumphal arches of the basilicas

THE ROMAN BASILICAS,

rich in architectural embellishments and adorned with mosaics; or the chancel arches of our own churches with the grand space above for painting afforded by the triangle of the open roof. Beyond the mere arch which divided the nave from the sanctuary, I think that the original designers considered the central towers, both of the cruciform and triple planned churches, as carrying out the triumphal idea; in this light we may consider the central octagon of Ely, as well as the dome of St. Peter's (the redeeming feature of the Renaissance) as among the noblest triumphal memorials ever erected, either in classic, mediæval or modern days. We may imagine the motive of the builders of such structures, when we read on the stiffening arches under the central tower of Canterbury Cathedral, the inscription: *Non nobis Domine non nobis*. A collection of such inscriptions would be a valuable testimony of the thoughts of the dedicators. That on the arch of Constantine's Vatican basilica, combined with the mosaics of our Lord with St. Peter and the Emperor, was to the effect that "Because the world, triumphant through Thy leadership, has risen to heaven, Constantine has founded this hall to Thy honour,"* whilst the inscription on

THE SCREEN IN ST. PAUL'S,

London, now removed to the north entrance, gave some credit to the seldom remembered architect.† The primitive dedication on the arch of St. Mary Major was "Sixtus, Bishop to the people of God," and the doorway of what is now the mosque of the Omayyades at Damascus,‡ after twelve centuries of use by the Mohammedans, carries the inscription in Greek, "Thy kingdom, O Christ, is an everlasting kingdom, and Thy dominion endureth throughout all generations." This doorway, 10ft. to 12ft. wide and double that in height, was the great doorway of the Roman temple which once occupied the site, and has now two smaller openings, one on either side, with semi-circular head, which Mr. Phené Spiers considers to have been originally niches cut through to form a triple entrance in A.D. 379, when the temple was converted into the Church of St. John the Baptist. For

AN EARLY CHRISTIAN DOMED CHURCH

I can go back to the first Christian emperor, who, in his zeal for church building and in the foundation of his new city, greatly influenced Art—he offered premiums to parents who had their sons educated as architects and was a powerful instrument in preserving for us Hellenistic traditions in Art. To Constantine is attributed§ the erection of the circular church of St. George at Thessalonica covered

* Downside Review, March, 1891.

† Roma Sotteranea. Bishop Brownlow and Provost Northcote.

‡ Eight miles from Canterbury; the erection of this church has been attributed to S. Theodore, but there is no mention of ecclesia or presbyter in the Domesday book.

* Quod duce te mundus surrexit in astra triumphans Hanc Constantinus Victor tibi condidit aulam.

† Si monumentum quaeris circumspice.

‡ Paper by Phené Spiers, read at the Institute of British Architects, 16th November, 1896.

§ "Byzantine Architecture": C. Texier, R. P. Pullan.

by a dome 80ft. in diameter; it was not, however, till Justinian rebuilt St. Sophia at Constantinople that a church with a great dome 110ft. in diameter, springing on pendentives from a square and carried by arches, the form I claim as the triumphal arched one, was erected; the creation of his architects Anthemius of Tralles and Isidore of Miletus. St. Irene at Constantinople, also re-erected by Justinian, is sometimes claimed as the first church with a dome raised on a drum, although Professor Aitchison points out that as it was much damaged by an earthquake between 717 and 741 the construction may not be the original one; be that as it may, the cathedral of the Holy Wisdom at Thessalonica is clearly the work of Justinian and of the school of his architect Anthemius who accompanied him in all his expeditions. This church has a central dome supported by four arches, has pendentives, and is raised on a drum pierced with windows. The dome, 34ft. in diameter, is adorned by a mosaic representation of the Ascension with the inscription

"YE MEN OF GALILEE,

why stand ye gazing up into heaven? This same Jesus, who is taken up from you into heaven, shall come as you have seen him going into heaven." If we have to thank Byzantium for this continuation and development of Art, we have also to lament the iconoclastic persecutions which endeavoured to destroy it and drove mosaicists and illuminators to Rome, which, in the eighth century, was the refuge of Art: although in the ninth "the iron age,"* as it has been termed, when triumphal arches were changed into forts, resort was necessary to Byzantium for the bronze gates now in the sacristy of St. Paul's, with niellos of silver, the work of a Greek monk. The traditions of Byzantine Art were carried on in Venice in the Church of St. Mark, built on the model of Justinian's destroyed church of the Apostles at Constantinople and elsewhere, as at Perigieux churches were built with the same motive, the raised triumphal cupola. In the continued development of the church building art, the dome was in the west, set aside through the inventive genius of the northern architects. The monastic orders retained, through their organisation and

BY THEIR CULTURE,

touch with Hellenism, whilst the lay architects, who took up and continued their work as church builders, were thrown more upon their own resources, and local traditions; and Gothic Architecture was developed, as we have it, with its inheritance of the past, a new skill in construction and a power of invention in form and arrangement which gave to our cities their grandest enrichments, the great central towers as the triumphal arches of mediæval Christianity. I have already mentioned these towers in this light, so pass on to what I take to be essays with the same motive of design in portals and façades. I have already instanced the addition made to the Roman doorway of the temple at Damascus of two smaller openings to bring it into the triple form of the triumphal arch when made to be the entrance to a Christian church, and at St. Mark's, Venice, the bronze horses, despoiled from the arch of an emperor, were made to crown the doorway of the church in triumph, and the entrances to churches such as S. Trophime Arles are veritable triumphal arches, noble in conception and with the

ARCH AND COLUMN HARMONIOUSLY UNITED, a feat never completely achieved in classic structures. From the portal to the entire façade was a natural growth, my space only allows me to adduce two, as falling in with my theme, Wells and Peterborough, and I select these because greater variations in cathedral façades can hardly be imagined, although I claim them as but different renderings of similar inspirations. The west front of St. Peter's great English cathedral is, as we all know, a composition of three wide and lofty arches rising to the spring of the gables and deeply recessed, it is a portico in fact, as well

as a triumphal arch; a simpler, bolder, more artistic treatment was never conceived, it is of the noblest order, the idea is so evident that I need not dwell upon it. The façade of Wells on the contrary is a crux, it is criticised as being but a screen, not in any way the natural following of the structure behind it—my suggestion is that it was really intended to be a version of the Greek screen, the triumphal screen bearing entrance to the sanctuary. The Iconostasis is a colossal screen occupying the whole width of the church, and is described as a

REPRESENTATION OF THE CELESTIAL KINGDOM.

In its architectural composition it is divided into bands, the lower one always having three doorways; the upper ones being series of niches one over the other filled with figures, the topmost representing the Blessed Trinity, the others in a certain order, our Lord, the Blessed Virgin, the Archangels, Patriarchs and Apostles; the central doorway has a representation of the Annunciation. In the complete screen, in addition to these bands of figures, there is one band of niches or panels of smaller size, containing subjects from the life of our Lord. Now in the façade of Wells we see, firstly, the horizontal band at the base, pierced by three doorways, the central one being adorned, not, indeed, by the first joyful mystery, but by the glorious one of the Coronation. Above are horizontal bands of niches, containing statues, one over the other carried across the whole façade in the buttresses, and even continued in the broad piers, so unusual at this period of design, which divide the lancet windows; above these bands there is a smaller band of panels with groups of figures as in the Iconostasis, but not containing scenes from the life of our Lord, but naked figures in various attitudes obviously representing the triumph over death at the Resurrection, above this there are rows of figures again

OF THE HEAVENLY HIERARCHY

and the twelve Apostles; crowning the whole, the fragment remains of a large figure, presumably of our Lord in judgment and triumph, completing the poem which commences with the coronation of the Blessed Virgin, whose body was, by a singular privilege, assumed to glory before the general resurrection. The work was erected by Joceline de Wells, and dedicated in 1239. It is contemporary with Salisbury, but unfortunately, not like that cathedral, completed with one idea. In the upper part of the towers, built at the end of the fourteenth and commencement of the fifteenth centuries, no attempt to carry out the original idea was made; and whilst in the beautiful arrangement of the altar end with the open arches to the Lady chapel, no image bearing rearedos would seem to be contemplated, in the later work above there is an arrangement of niches and statues, perhaps to compensate for the omission. We do not know who conceived this great work; the general idea is rather that of a contemplative religious than of an artist. Perhaps he was

A GLASTONBURY MONK,

for Jocelyn till 1218 was Bishop of Glastonbury as of Wells. For the designers and workers of the details there were cementarii at Wells of the names of Lock, Norreys, and Noreis (Dean Church notes that Ganfridus de Noiers was the name of St. Hugh's architect at Lincoln), and one Deodatus. A member of the family of Buneton was established in Glastonbury in 1249, and in Edward II.'s time de Buneton the sculptor was possessed of houses and lands in Glastonbury. Another name is found at Wells famous for architectural work, Elias de Derham, known at Salisbury as Canon, rector ecclesiæ and architect between 1220 and 1229. He was known at Canterbury as one of the incomparable artificers of the new shrine of St. Thomas in 1220, and at Winchester as master of the works in the King's Hall 1230-6*. Of the names of these, as of so many artists, we have chance records, but their works live after them. Dean Church, in his "Chapters on the Early History of the Church of Wells," says:

* Dean Church: Wells Cathedral.

"Generation after generation saw the deeply recessed niches, the six hundred tabernacle gradually filled with sculptured imagery telling the whole tale of earth and heaven of man's fall and resurrection, of the Lord's advent in mercy and in judgment, and of the long roll of saints and worthies of the race, their own land." My explanation would take a more limited view of the intention. Mr. F. C. Dollman, who was working as a pupil of Augustus Pugin, early in the thirties at Glastonbury, tells me that his fellow pupil, Benjamin Ferrey, in 1870 discovered the presunably to guide the masons in placing the statues, the figures and sculptures north of the centre were marked on the back with

ARABIC NUMERALS,

while those on the south had Roman numerals evidence of system in the arrangement. Going from mediævalism to the Hellenism of the Renaissance, we find the designers working on very different lines to those of the earlier Christian architects we have been considering ancient forms which had lost their meaning were again used, and the spirit of the artist may be exemplified by the Florentine sculptors who made the gates for the basilica of St. Peter's fixed in 1445, and still existing. The Pope may have selected the subjects for the main panels; figures of our Lord and of the Blessed Virgin, and events from the life of St. Peter, and in the narrower panels of the reign of the Pope; but in the more decorative portions naturally he would leave the artist to follow their own bent, resulting in the introduction of Paganism with subjects such as that of Leda and the swan. Christian Art was for a long period kept alive in Italy by artistic workers, such as the Marmorari of the 12th century and the Cosmas of the following one. Those lovely cloisters, tabernacles, pulpits, tombs, and other such works of ecclesiastical Art, exemplify their style. Some of the smaller works from

DESECRATED CHURCHES

now enrich our museums. It was in the Pontificate of Innocent III. (1198-1216) that the cloisters of St. Paul outside the walls and of St. John Lateran were commenced. The study of Hellenic Art had a fresh impulse in Italy when some antique sarcophagi came under the notice of Nicola Pisano, but the workers in Art now were painters, sculptors, and goldsmiths rather than architects. I Arnolfo di Lapo, from whose plans the Duomo of Florence was commenced in 1280, had possessed the architectural sentiment of the Northern church builders, we might have possessed a work outrivalling the central octagon of Ely, constructed in marble, and Giotto's tower would not have stood alone in its beauty of detail. We do not know, however, if Arnolfo had any idea how the central octagon of his church was to be covered, and it was left to Brunelleschi to project the revival of the cupola supported on a drum; and to Michael Angelo came the opportunity and glory of designing the crowning dome of the work of that of St. Peter's. The actual erectors under Sixtus V. were Giacomo della Porta and Fontana, who heightened the section, making it the form of a pointed arch instead of hemispherical, to give support to the stone lantern, not sufficiently, unfortunately, to secure stability, as resort had to be taken to the iron band, as in so many cases in Italian arched work, to the iron tie. The triumphant recital on the base of the dome of the foundation of the Church of Christ on the rock of St. Peter need not be recited. With St. Peter's pointed arch, dome, the natural outcome of a great phase of Christian Art, even if clothed in classic detail as a golden link of continuity, I close my article.

THE foundation-stone has been laid of new infirmary which is about to be erected by the Central London Sick Asylum District Board. The estimated cost of the new buildings is £95,510, or, with the addition of £12,428 for the site, a total of £107,938. The infirmary will, when completed, provide accommodation for 274 patients, and the site allows ample room for any extension that may become necessary.

R.I.B.A.

PROFESSIONAL CHARGES OF ARCHITECTS.

THE ANNUAL ELECTIONS.

SEVERAL matters of importance were dealt with at a business meeting of the Royal Institute of the British Architects, held on Monday week. Chief among them was the consideration of the revised Institute paper on "The Professional Practice as to the Charges of Architects." The schedule as sanctioned by the Institute and confirmed at a general conference of architects of the United Kingdom in 1872, is given in the Kalendar. As now revised, the schedule runs as follows:—

1. The usual remuneration for an architect's services except as hereinafter mentioned is a commission of 5 per cent. on the total cost of works executed under his directions. Such total cost is to be valued at as though executed by a builder with new materials. This commission is for the necessary preliminary conferences and sketches, approximate estimate when required (such, for instance, as may be obtained by cubing out the contents), the necessary general and detailed drawings and specifications, one set of tracings and duplicate specification, general superintendence of works, examining and passing the accounts, exclusive of measuring and making out extras and omissions. The clerk of the works should be appointed by the architect, his salary being paid by the client.

2. This commission does not include the payment for services rendered in connection with negotiations relating to the site, or in surveying it and taking levels, making surveys and plans of buildings to be altered, making arrangements in respect of party-walls and rights of light, or for drawings and correspondence with local and other authorities, or consequent on the failure of builders to carry out the works, for services in connection with litigation or arbitration, or in the measurement and valuation of extras and omissions. For such services additional charges proportionate to the trouble involved and time spent are made.

3. In all works of less cost than £1000, and in works requiring designs for furniture and fittings of buildings, or for their decoration with painting and mosaics, sculpture, or stained glass and other like works, and in cases of alterations and additions to buildings, 5 per cent. is not remunerative, and the architect's charge is regulated by special circumstances and conditions.

4. When several distinct buildings, being repetitions of one design, are erected at the same time from a single specification and one set of drawings and under one contract, the usual commission may be charged on the cost of one such building, and a modified arrangement made in respect of the others; but the arrangement does not apply to the reduplication of parts in one building undertaking, in which case the full commission is to be charged on the total cost.

5. If the architect should have drawn out the approved design complete, with plans, elevations, sections, and specification, the charge is 2½ per cent. upon the estimated cost. If he should have procured tenders in accordance with the instruction of his employer, the charge is ½ per cent. in addition. These charges are exclusive of the charge for taking out quantities. Preliminary sketches and interviews, where the drawings are not further proceeded with, are to be charged for according to circumstances.

6. The architect is entitled during the progress of the work to payment by instalments on account at the rate of 5 per cent. on the amount of the certificates when granted, or alternatively on the signing of the contract, to half the commission on the amount thereof, and the remainder by instalments during their progress.

7. Should the client, having approved the design and after the contract drawings have been prepared, require material alterations to be made, whether before or after the contract

has been entered into, extra charge should be made in proportion to the time occupied in such alterations.

8. The charge per day depends upon an architect's professional position, the minimum charge being three guineas.

9. The charge for taking a plan of an estate, laying it out, and arranging for building upon it, is regulated by the time, skill, and trouble involved.

10. For setting out on an estate the position of the proposed road or roads, taking levels, and preparing drawings for roads and sewers, applying for the sanction of local authorities, and supplying all necessary tracings for this purpose, the charge is 2 per cent. on the estimated cost. For subsequently preparing working drawings and specifications of roads and sewers, obtaining tenders, supplying one copy of drawings and specification to the contractor, superintending works, examining and passing accounts (exclusive of measuring and valuing extras and omissions), the charge is 4 per cent. on the cost of the works executed, in addition to the 2 per cent. previously mentioned.

11. For letting the several plots in ordinary cases the charge is a sum not exceeding a whole year's ground rent, but in respect of plots of great value a special arrangement must be made.

12. For approving plans submitted by the lessee, and for inspecting the buildings during their progress, so far as may be necessary to ensure the conditions being fulfilled, and certifying for lease, the charge is a percentage not exceeding 1½ per cent up to £5000, and above that by special arrangement.

13. For valuing freehold, copyhold, or leasehold property the charge is—

On £1,000 ..	1 per cent.
Thence to £10,000 ..	½ "
Above £10,000 ..	¼ " on residue.

In valuations for mortgage, if an advance is not made, one-third of the above scale. The minimum fee is three guineas.

14. For valuing and negotiating the settlement of claims under the Lands Clauses Consolidation Act or other Acts for the compulsory acquisition of property, the charge is on Ryde's scale as follows:—

On Amount of Settlement, whether by Verdict, Award, or otherwise.

Amt.	Gs.	Amt.	Gs.	Amt.	Gs.	Amt.	Gs.
£		£		£		£	
100	5	2,200	24	5,200	39	8,200	54
200	7	2,400	25	5,400	40	8,400	55
300	9	2,600	26	5,600	41	8,600	56
400	11	2,800	27	5,800	42	8,800	57
500	13	3,000	28	6,000	43	9,000	58
600	14	3,200	29	6,200	44	9,200	59
700	15	3,400	30	6,400	45	9,400	60
800	16	3,600	31	6,600	46	9,600	61
900	17	3,800	32	6,800	47	9,800	62
1,000	18	4,000	33	7,000	48	10,000	63
1,200	19	4,200	34	7,200	49	11,000	68
1,400	20	4,400	35	7,400	50	12,000	73
1,600	21	4,600	36	7,600	51	14,000	83
1,800	22	4,800	37	7,800	52	16,000	93
2,000	23	5,000	38	8,000	53	18,090	103
						20,000	113

Beyond this Half-a-Guinea per cent.

The above scale is exclusive of attendances on juries or umpires, or at arbitrations, and also of expenses and preparation of plans.

15. For estimating dilapidations and furnishing or checking a schedule of same, the charge is 5 per cent. on the estimate, but in no case less than two guineas. For services in connection with settlement of claim by arbitration or otherwise, extra charges are made, under Clause 8.

16. For inspecting, reporting, and advising on the sanitary condition of premises, the charge must depend on the nature and extent of the necessary services rendered.

17. In all cases travelling and other out-of-pocket expenses are paid by the client in addition to the fees. If the work is at such a distance as to lead to an exceptional ex-

penditure of time in travelling, an additional charge is made under Clause 8.

18. When an architect takes out and supplies to builders quantities on which to form estimates for executing his designs, he should do so with the concurrence of his client, and it is desirable that the architect should be paid by him rather than by the builder, the cost of such quantities not being included in the commission of 5 per cent.

The paper was discussed and the debate adjourned for further consideration at a meeting to be held on the 27th inst.

THE ANNUAL ELECTIONS.

Other important business included the annual elections.

THE COUNCIL.

The Council for the year of office 1898-99 were declared to be duly elected as follows:—

PRESIDENT.—Professor Aitchison, R.A.
VICE-PRESIDENTS.—William Milner Fawcett, M.A.Cantab., F.S.A.; Henry Louis Florence; Ernest George; and Edward Augustus Gruning.

HON. SECRETARY.—William Emerson.
MEMBERS OF COUNCIL.—John Belcher; Thomas Blashill; James Brooks; John McKean Brydon; William Douglas Caröe, M.A.Cantab., F.S.A.; Campbell Douglas (Glasgow); John Alfred Gotch, F.S.A. (Kettering); Alexander Graham, F.S.A.; Benjamin Ingelow; Edward William Mountford; Beresford Pite; John Slater, B.A.Lond.; Percival Gordon Smith; Richard Phené Spiers, F.S.A.; Henry Heathcote Statham; Leonard Stokes; Paul Waterhouse, M.A.Oxon.; and Aston Webb, F.S.A.

ASSOCIATE-MEMBERS OF COUNCIL.—Arthur Smyth Flower, M.A.Oxon, F.S.A., and Henry Thomas Hare.

REPRESENTATIVES OF ALLIED SOCIETIES.—Robert Isaac Bennett (Manchester Society); William Larkins Bernard (Bristol Society); Albert Nelson Bromley (Nottingham Society); John James Burnet, A.R.S.A. (Glasgow Institute); Thomas Drew, R.H.A. (Royal Institute of Ireland); Charles Busted Fowler (Cardiff, South Wales, and Monmouthshire Society); James Hine (Devon and Exeter Society); Leslie Ower (Dundee Institute); and Albert Edwin Sawday (Leicester and Leicestershire Society).

REPRESENTATIVE OF THE ARCHITECTURAL ASSOCIATION (London).—George Halford Fel-lows-Prynn.

THE STANDING COMMITTEES.

The following Fellows and Associates were declared duly elected to serve on the respective Standing Committees for the ensuing year of office, viz.:—

ART STANDING COMMITTEE.—*Fellows.*—John Macvicar Anderson, F.R.S.E.; James Brooks; John McKean Brydon; William Douglas Caröe, M.A.Cantab., F.S.A.; Ernest George; Edward William Mountford; Beresford Pite; Henry Heathcote Statham; Alfred Waterhouse, R.A., LL.D.; and William Young.

Associates.—Robert Shekleton Balfour; Owen Fleming; James Siewright Gibson; Henry Thomas Hare; George Campbell Sherrin; and John William Simpson.

LITERATURE STANDING COMMITTEE.—*Fellows.*—Henry Louis Florence; Alexander Graham, F.S.A.; Benjamin Ingelow; John Tavernor Perry; William Alfred Pite; Sydney Smirke; Richard Phené Spiers, F.S.A.; Henry Heathcote Statham; Paul Waterhouse, M.A. Oxon.; and Ralph Selden Wornum.

Associates.—Arthur Thomas Bolton; Arthur Smyth Flower, M.A. Oxon., F.S.A.; Andrew Noble Prentice; Ravenscroft Elsey Smith; Leslie Waterhouse, M.A. Cantab.; and Percy Scott Worthington, M.A. Oxon.

PRACTICE STANDING COMMITTEE.—*Fellows.*—Thomas Batterbury; Samuel Flint Clarkson; Thomas Harris; George Hubbard; Alexander Henry Kersey; Joseph Douglass Matthews; Walter Hilton Nash; James Osborne Smith; Charles James Smithem; and Edmund Woodthorpe, M.A.Oxon.

Associates.—William H. Atkin-Berry; Charles Henry Brodie; Francis Thos. Wilberforce Goldsmith; Herbert Hardwicke Lang-

ston; Augustus William Tanner; and William Henry White.

SCIENCE STANDING COMMITTEE.—*Fellows*.—Lewis Angell, M.Inst.C.E.; Hampden William Pratt; John Salmon Quilter; Herbert Duncan Searles-Wood; William Howard Seth-Smith; Percival Gordon Smith; Alfred Saxon Snell; Lewis Solomon; William Charles Street, Assoc.Inst.C.E.; and Benjamin Tabberer.

Associates.—Sydney Benjamin Beale; Henry William Burrows; Max Clarke; Bernard John Dicksee; Matthew Garbutt, Assoc.-M. Inst.C.E.; and George Pearson.

The Auditors are Messrs. Zeph. King and Frederick William Marks.

MEMBERSHIP ELECTIONS.

The following candidates were elected to the rank named:

As FELLOWS.—Michael Francis Cavanagh [A., qualified 1888], Vice-President of the West Australian Institute of Architects; of Eagle Chambers, Perth, West Australia. John James Thomson [A.]; of 1, Durham Place, Chelsea. Charles Edward Bateman [A., qualified 1895], President of the Birmingham Architectural Association; of 81, Edmund Street, Birmingham; and Castle Bromwich. James Souttar, President of the Aberdeen Society of Architects; of 42, Union Street, Aberdeen; and 6, Beaconsfield Place, Aberdeen. Frederick William Lacey, M.Inst.C.E.; of the Municipal Office, and Alum Chine, Bournemouth. George Campbell Sherrin [A.]; of 33, Finsbury Circus; and Ingatestone, Essex. William Banks Gwyther, Assoc.M.Inst.C.E. [A., qualified 1886]; of the Public Works Department, Bengal Secretariat, Calcutta.

As ASSOCIATES.—George Benson [Qualified 1885], President of the York Society; of Nunthorpe Avenue, York. Frank Peck [Qualified 1895]; of Roseneath, Alexandra Road, Kingston Hill.

As HON. FELLOW.—Sir Edward John Poynter, President of the Royal Academy; 28, Albert Gate, S.W.

WHILE the ringers in the curfew tower at Windsor Castle were ringing the last peal for the Duke of York's birthday, the axle from which the big tenor bell was swinging suddenly broke, and the huge mass of metal fell on to the strong old beams below, where it remained. The ringers at the time of the occurrence were in the lower chamber. The bell was cast early in the seventeenth century, and weighs about 36cwt.

THE case of Fasnacht v. Knight-Gregson was heard in the Probate, Divorce, and Admiralty Division before Mr. Justice Phillimore and a Common Jury a few days ago. It was an action for the conversion of certain architectural plans. The plaintiff, an architect, of 17a, Great George Street, Westminster, was negotiating during 1893 and 1894, on behalf of a Mr. Britton, for the purchase of a piece of land in Tite Street, Chelsea, with the defendant, who was the solicitor to the freeholder. The plaintiff prepared plans of a block of flats to be erected on the land, which plans he alleged were based on a somewhat new principle, and which he entrusted to the defendant for the approval of the owner. The negotiations ultimately broke down, but the plans remained at the office of the defendant, 4 and 5, Adam Street, Adelphi. In October, 1896, the defendant, without, as the plaintiff alleged, any authority from him, handed over the plans to Messrs. Walton and Lee, a firm of auctioneers, with the intent that they should be used for exhibiting to intending purchasers of the land, and so aiding a sale of it by auction or private treaty. The plans were exhibited to a gentleman, who subsequently purchased the land, and plaintiff alleged that some features were borrowed from them and embodied in new plans. He claimed £105 as the value of the plans.—The defendant denied the truth of the plaintiff's story. The plaintiff asked him to show the plans to intending purchasers in order that the plaintiff might be employed as architect. It was for this reason that he sent the plans to Messrs. Walton and Lee.—Two witnesses from that firm deposed that the plaintiff had himself asked them to exhibit the plans.—The jury returned a verdict for the defendant, and judgment was entered accordingly, with costs.

Professional Items.

ABERDEEN.—The City Hospital Committee of the Aberdeen Town Council has had under consideration the proposed extension of the administrative block at the hospital. Mr. Rust, city architect, has submitted amended plans showing ample accommodation for nurses and servants on the main block and also showing the extension of the north wing of the present reception block. The total cost of the extensions is estimated at £4560, made up as follows:—Extension of the administrative block, £4000; furnishings, £400; and extension of the diphtheria ward, £250. The committee generally approved of the plans.

ABERCYNON.—The tender of Mr. Games, builder and contractor, of Abercynon, has been accepted by the committee of the new Welsh Congregational Chapel. The contract price is £2500, and the architect is Mr. A. O. Evans, Pontypridd.

BANGOR.—The foundation stones of a new church in Hamilton Road, which is well on in the course of erection, were laid a few days ago. The new edifice has been designed with special view to ultimate extension. The general plan of the church is horseshoe shape, this plan having been found in other places to be more comfortable, and to give better acoustic properties than the usual rectangular form. The first block will accommodate about 400 on the ground floor, and about 300 in the galleries, and the future block, in the form of a second transept, will give accommodation for about 300, so that the church is designed to accommodate 1000 persons. The front entrance vestibule is in the form of a large room, with inner lobbies, right and left. Although the church is on a wide plan, there will be no inconvenient columns to obstruct the view. The galleries will be carried on steel cantilever girders, and the roof trusses will also be of steel. It is proposed to fit up the interior woodwork in pitch pine, and the walls of the building in local stone, with Scrabo stone for dressings. A corner tower has been provided, to which it is possible to add a spire in the future, if desired. The building has been designed in the perpendicular period of Gothic Architecture. The architect for the church is Mr. Wm. J. W. Room, Belfast. The contract is in the hands of Mr. James Colville, builder and contractor, Bangor.

BARNSELY.—The foundation stones of a new theatre on the site of the old building in Wellington Street, Barnsley, were laid a few days ago. The new erection is estimated to cost £10,000 exclusive of the site. It is being built in the latest style from plans by Mr. W. Emden, London, and under the local supervision of Mr. W. Crawshaw, architect.

BELFAST.—The laying of the memorial-stones of the new Presbyterian Church in the course of erection at Woodvale, Belfast, was performed some few days ago. The new church has been designed to occupy an excellent site facing Shankill Road, adjacent to Woodvale Park. As one side of the building is turned to the Whiterock Road, a square tower with more spire is placed at the angle, and will form a conspicuous landmark owing to its elevated position. A plan of a simple nave and aisles, with shallow transepts occupying an oblong space of about 90ft. by 70ft. was adopted. An imposing feature consists of the doorway, placed in the centre of the gable with played jambs and richly moulded arches. The contractor for the entire work is Mr. Thomas McMillan, Ormeau Avenue, and the architects are Messrs. Young and Mackenzie, Belfast.

COALVILLE.—The foundation of a new church in course of erection at Bardon Hill, near Coalville, has been laid. The contractor is Mr. H. Bland, of Leicester, and the amount of the contract approximately is £5000. The building is 95ft. in length by 57ft. in width,

and will when completed seat about 200 people. The style is geometrical decorated. There will be a tower 85ft. in height.

DUNDEE.—The plans of the Victoria Hospital for Incurables, Dundee, have been approved by the Works Committee of the Town Council. The plans have been designed by Mr. T. Murray Robertson so that the building can be extended by means of wings. The towers contain bathrooms, lavatories, &c., and the present building provides ample accommodation for administrative purposes, and for any extensions that may be necessary.

GATESHEAD.—A new parish hall is being built in connection with the sanctuary known as that of the Venerable Bede. It is of stone, and will match the older erection. Sufficiently large to accommodate a few hundreds of people, its cost will be something like £1500.

GILVACH.—A new mixed school was opened a short time ago at Gilvach, near Bargoed. The work has been carried out by Mr. Thomas Williams, builder, Bargoed, under the supervision of Messrs. James and Morgan, architects, Cardiff. The accommodation is at present for 155 children, but the building will be capable of an extension for 100 more. The school has been built at a cost of £2208.

GLASGOW.—Building operations have now commenced in connection with the new parish church and halls, Hutchesontown, Glasgow. The main frontage is to Rutherglen Road, the design is semi-Romanesque, and will be a handsome structure. The church provides accommodation for 950, having side and back galleries, organ chamber, session house, vestry, &c. The hall is seated for 600, with library, kitchen, committee rooms and lavatories. The total estimated cost is £6274 6s. 7½d.

GOVAN.—At a Dean of Guild Court at Govan, Mr. A. Macdonald was granted the necessary permission to erect new municipal buildings and offices and public halls on a sight at the junction of Govan Road, Summertown Road, Carmichael Street, and Merryland Street. There will be a large hall capable of accommodating 2000 persons, with the usual cloak and retiring-rooms adjacent. The cost of the buildings will be £34,000.

HACKENTHORPE.—The foundation-stone of a district church at Hackenthorpe was laid recently. Mr. J. D. Webster, of Sheffield, is the architect, and Messrs. Kirby and Drabble, of Mosborough, the contractors for the permanent church now in course of erection. It was decided to build the nave only of the church at first, at a cost of £1415.

LEEK.—The committee have accepted the tender of Mr. Thomas Grace, of Leek, for the new offices, stores, bakeries, shops, assembly and board rooms, &c., of the new Co-operative headquarters, designed by Messrs. Wm. Sugden and Son. When fitted up and furnished it is estimated the cost will be about £3500. Mr. Johnson, C.E., of Macclesfield, will construct the ovens on his improved method. "Fair wages" clauses are incorporated by the architects in all these contracts. Recently the society erected the first section (costing £1000) of a new branch in Daton Street to the same architect's plans.

MORECAMBE.—With the rapid development of Morecambe comes a scheme, involving an expenditure of nearly £10,000. This is in the provision of new Board schools. The School Board has resolved to purchase about 6000 square yards of land from the London and North-Western Railway Company at a cost of £1 per yard. The site is practically in the centre of the town. The new schools are intended to supersede the present buildings in Anderton Street, which are somewhat unsatisfactory.

NEWBURGH.—A tenement of four two-room and kitchen houses is about to be erected in the Mount Pleasant district. The site chosen

as been acquired by Mr. A. Ross, builder, from Mr. T. S. Anderson. Each house is self-contained, while every modern convenience is considered. The plan is by Mr. Haggart, Junior, Elmside, Abernethy. Additions have been begun to the property of the Lindores Edge of Freemasons. Messrs. C. and L. Ower, architects, Dundee, were asked to prepare plans for an additional two flats. The first flat is to be a modern dwelling-house, while the top flat is to be devoted to a commodious ante-room, with lavatory accommodation.

NEWCASTLE.—A building exchange has been established in Newcastle on similar lines to kindred institutions in Glasgow and in various cities in other places. A limited liability company has been formed to carry on the exchange at Newcastle. The company has been formed with a capital of £10,000 in £1 shares. Four rooms have been set apart in the Arts Club for the use of the members of the Exchange. There are a large reading-room, in which all trade literature will be accessible; an office; and two rooms for the exhibition of trade samples.

NEWPORT (MON).—The tender of Mr. W. A.inton, builder and contractor, of Newport, has been accepted by the committee of the new church of St. John the Baptist, which is to be erected on a site given by Lord Tradegar on the left side of the Risa Road, Newport. The contract, which does not provide for a tower, is £7350.

NEWRY.—The Treasury authorities have agreed to commence the erection of the new Post Office at Newry. It is now over two years since a promise was obtained from the Government that they would erect a new and more commodious building than at present exists, and last year a very fine site was purchased in Hill Street, close to the old Post Office. Ever since that the plans have been under consideration. A few months ago tenders were applied for, and the one sent in by Mr. Alex. Wheelan, builder, Newry, has been accepted, and the work will be gone on with immediately. The Commissioners want the plans altered to allow more room in the public office, in front, and they also want the building to be faced with granite, but so far the Treasury will not give way. Mr. Wheelan has presented three large Government contracts hand.

TULLAMORE.—The foundation stone of the new Catholic church at Tullamore was laid last week. The new church will be of large dimensions, calculated to seat 1600 persons with additional space for 500 more on special occasions. The cost is estimated at about 5,000. Mr. Wm. Hague, of Dublin, is the architect.

WESTLEIGH.—Westleigh, near Bideford, has extended well to its old church. Twenty years ago it was intended to substitute an organ for the harmonium. A difference as to who should be the builder caused an abandonment of the scheme, and the church was restored instead, and it may fairly be added, finely restored. When a new peal was placed in the belfry, and the churchyard enlarged; and a few days ago was dedicated an organ of splendid tone and ample power. The case is so designed that the main pipes discharge their sounds into the chancel without encroaching upon it. The organ also includes an oak screen to harmonise with the organ case, and the entire cost will be about £400.

WOLVERCOTE.—The formal opening of a new school at Wolvercote has taken place within the past few days. Besides the school buildings the scheme also includes the provision of a residence for the master and mistress, and this has been erected on the left side of the school, the total cost of the whole being about £2000. The building is in the ordinary scholastic style, being of red brick and Bath stone dressings, and roofed with Broseley tiles.

Views and Reviews.

THE LAW RELATING TO MARKETS AND FAIRS.

This book has been published to supply all the information useful to market owners and traders who frequent markets, and this information is set forth with as much clearness as the subject permits. An appendix gives the Markets and Fairs Clauses Act, 1845, the report of the Royal Commission on Markets, 1887, a list of statutes, and specimen table of tolls. It is always interesting to the architect to note the old customs and usages which originally suggested the different arrangements of different classes of buildings. There is no building with a more characteristic form than a market hall, and in this book before us may be found many customs now crystallised into laws which give the original meaning of many arrangements, which are now followed as a matter of habit. It is curious to note that where no stalls are fixed to the ground, the owner is not liable to be rated in respect of his profits. It would not occur to everyone that the absence of fixed stalls in old market halls is to be accounted for in this way. The more we know of the conditions governing the erection of any building, the better we understand it.

A. R. J.

"The Law relating to Markets and Fairs," by L. Gaches, Barrister. London: Eyre and Spottiswoode. Price, 2s. 6d.

ARCHITECTURAL PHOTOGRAPHY.

This little book consists of a reprint of articles which appeared in *The Amateur Photographer*. There are nine of them, beginning with Hints to Beginners, and passing on to discuss such questions as the effect of light, exterior and interior views, &c. It is illustrated by many photographs, serving as examples of the points under discussion. Being re-published as a volume of the *Amateur Photographer Library*, it is perhaps principally intended for the general amateur—amateur in Architecture as well as in photography—and as such, we are pleased with the author's endeavour to open his readers' eyes to the meaning and the poetry of the buildings upon which he operates. "Find out what your building means," says the author, "and endeavour to represent that." Better advice could not be given; but when we come to individual instances, the author has a way of labelling every view with its appropriate sentiment, thus—"The leading note of the porch at Dol is rest, of shelter and repose after exposure, but it is combined with desolation"; and then, again, he so expresses himself as to suggest that there is a sort of receipt for interpreting every possible sentiment or emotion. Thus, with reference to Dinan, the formula would be—to express "sheer weight and passive resistance," use "breadth of treatment and delicate tone gradation." With reference to Nuremberg: "Sombre, weird, and yet romantic"—"low tones and doubtful focus"; or, again, with regard to Ightham Church: "Retirement is conveyed in the photograph by gloom and under-exposure." For the amateur this may be all very well; the great thing is to get him to see that everything in a building means something, expresses something, that there is a sentiment of some sort in the design; but for the architect, who is alive to all this, it is perhaps just a little irritating. The chief value of the book to him will consist in the technical assistance it affords him in realising any effect he wishes to produce, and for this purpose any architect who uses the camera cannot fail to find some hints that will be useful. Anyone thinking of starting photography cannot do better than buy it.

THE INSTITUTE EXAMINATIONS.

To the Editor of *THE BUILDERS' JOURNAL*.

DEAR SIR,—I would like to know the opinion of your readers as to the best means of preparing for the final R.I.B.A. examination. Living in the provinces there are no available lectures or classes—except building construction. The testimonies of study which may be done in London at the classes are only worked out after a lot of unnecessary reading. Do I hear someone exclaim "Get a coach?" Well, a coach no doubt is almost essential, but I do think the examiners (especially at London sitting) ought to make some allowance in examination for provincial students who have not the advantages of London men, or where an architectural school and professor exists. Office work, overtime, &c., ought also to be taken into consideration, and I think provincial students might have the rule, *re* passing the final within four years of the intermediate, extended to five. I advocate all students passing an examination before practising; but because a student may not get through the final with the four years, why make him sit all examinations over again, or, as the Institute rule says, his name shall be crossed off the list of students.—Faithfully yours,

"PROVINCIAL STUDENT."

Enquiry Department.

C.E.

To the Editor of *THE BUILDERS' JOURNAL*.

DEAR SIR,—Will you kindly inform me the meaning of the initials C.E. written after a man's name? I presume it is Civil Engineer, but can you tell me by what means a man becomes entitled to write this after his name, and how I can ascertain whether such person is entitled to ascribe himself as such?—Yours truly,

ANDREW FORD.

The initials "C.E." affixed by the owner to his name are usually intended to imply that he is practising as a civil engineer in a consultative capacity. Although a Bill was brought before Parliament some years ago with the object of rendering compulsory the registration and examination of architects and civil engineers, both professions still remain without official recognition or protection. Consequently it is open to any person to style himself "Civil Engineer" or "C.E.," and the term in itself does not necessarily imply qualification of any kind. Civil engineering is defined in the charter of the Institution of Civil Engineers as "being the art of directing the great sources of power in nature as applied in the construction of roads, bridges, aqueducts, canals, river navigation, docks, ports, &c., in the art of navigation by artificial power, in the construction of machinery, and in the drainage of cities and towns." Members (M.I.C.E.) and Associate Members (A.M.I.C.E.) before election are required to furnish proof that both their training and experience have been sufficient, and the same condition is attached to membership of the other important institutions representing distinct branches of civil engineering. Those who are entitled to use after their names letters which possess a recognised value, prefer such to the initials "C.E.," and the adoption of the latter as a sort of self-bestowed diploma carries no weight in the profession, although it may in some cases be misunderstood by the general public to imply membership of the Institution of Civil Engineers.

ON the application of the Kingston Corporation, the First Commissioner of Works has decided to widen the local entrance to Richmond Park, and the work is now in hand.

SOME quarrymen were opening a quarry at Penyfai, near Bridgend, when they came upon an old kiln which had been used in ancient times for drying corn. It is circular in form, and of sandstone, similar to the material used in building the Asylum.

Under Discussion.

WATER GAS AND ITS APPLICATION.

In the course of his lecture on "Water Gas and Its Application," before the Society of Arts, Professor Vivian B. Lewes estimated that 34,000 cubic feet of this gas might be obtained from one ton of coke. He also explained new processes by which the carbon was made to give 3.47 times as much heat as in previous experiments. One scientist working on this method had produced the gas, the Professor stated, at about 3d. per 1000 cubic feet. If corporations having control of the gasworks and the electric lighting of a town adopted this system of working, it was asserted that they would be able not only to give electrical power at a price far below that at which it was obtainable by other means, but to keep up the price of coke.

EDINBURGH ASSOCIATION'S EXCURSION.

The members of the Edinburgh Architectural Association, accompanied by the president, Mr. Thomas Ross, and the secretary, Mr. Hunter Crawford, held their annual excursion a few days ago, the place visited being Alloa. The party at once proceeded to inspect the palatial Public Baths and Gymnasium. Mr. John Burnett, A.R.S.A., Glasgow, the architect of the building, acted as guide. Alloa Park and Mansion were next visited, and, through the kindness of the Earl of Mar and Kellie, the excursionists were conducted over Alloa House and the beautifully laid out garden and grounds. His Lordship personally undertook this duty, and afterwards entertained the company to lunch in old Alloa Tower. In the afternoon visits were paid to Greenfield House and Inglewood, the architect of both, Mr. Sydney Mitchell, Edinburgh, giving all necessary explanations. The company also visited the Town Hall and Public Library, and Alloa Parish Church.

CONCERNING ELECTRICITY.

The annual meeting of the Municipal Electric Association was held at the theatre of the United Service Institution, Whitehall. Mr. A. H. Gibbings, the electrical engineer for Bradford, delivered the presidential address. He congratulated the members on the exceptionally rapid progress which electricity had made within the last two years. The growth of the business of electricity was much more rapid than that of gas supply. The electricity committees of municipalities were now dealing with electric tramways, street lighting, methods of charging for current, and the extension of existing electricity works, with an eye to a greater future development than was dreamt of five years ago. Mr. Hesford (ex-chairman of the electricity committee of the Southport Corporation) read a paper on "The Management of Electrical Undertakings by Local Authorities." Mr. J. A. Jeckell (borough electrical engineer, South Shields) on "Steam-Using Plant," and Mr. J. R. Blaikie, the chief assistant electrical engineer, Bristol, on "Switchboard Apparatus."

THE Postman's Park, or at least that portion of it which has been threatened by the builder, has been rescued by the parish of St. Botolph, Aldersgate. Under an arrangement which has now been made, £6000 will be paid for the western frontage, and the parish will have the option of paying the remaining £6000 within two years from midsummer.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABER (near Caerphilly).—For the erection of sixteen houses for the Panteg Building Society. Messrs. Griffiths and Jones, architects, Tonypandy:—
J. Bowen ... £2,120 J. P. Williams, Leng.
O. Evans, Sons, & Co. 2,928 J. Henrydd, nr. Caerphilly* £2,760
G. H. Leonard ... 2,928 J. Lewis ... 2,736
*Accepted.

BOURNEMOUTH.—For the erection of a new residence for Miss Seymour, at Southbourne-on-Sea, Hants. Mr. G. A. Birch Livesey, architect. Quantities by Messrs. Jennings and Goater:—
Miller and Sons ... £2,269 W. Hoare ... £2,194
Jenkins and Sons ... 2,236 J. McWilliam & Son* ... 2,149
F. Hoare and Sons ... 2,210
*Accepted.

FARNHAM.—For the erection of four cottages for Mrs. Kelly. Mr. J. A. Eggar, architect, 11, West-street, Farnham:—
James Kimber ... £1,330 10 Crosby and Co.,
A. J. Figg ... 1,320 0 Farnham* ... £1,198 0
*Accepted.

GOSPORT.—For erecting a house at Gosport, for Mr. H. Martin. Mr. W. H. Fry, architect, Gosport:—
Eans ... £3,045 Jones ... £2,440
Ward ... 2,927 Dash ... 2,549
Corke ... 2,700 C. Jobbins ... 2,543
Light and Son ... 2,659 J. Croad ... 2,384
Spriggins ... 2,650 C. Lear and Sons ... 2,310

GUILDFORD.—For erecting St. Saviour's Church, Guildford. Messrs. Henry S. Legg and Son, architects, Christ's Hospital, London:—

	For first portion.	For second portion.	Total.
Mitchell Bros.	£6,104	£4,715	£10,819

Stanley Ellis	5,646	4,348	9,994
F. Swayne and Co.	5,429	4,072	9,501
Dove Bros.	5,230	4,005	9,235
Higlett & Hammond	5,226	3,972	9,198
W. Smith and Son	5,193	3,963	9,156
F. Goddard	5,029	3,826	8,855

LEEK.—For erecting new head offices, stores, assembly and board room, bakery, &c., for the Leek and Moorlands Co-operative Society Ltd. Messrs. Sugden and Son, F.R.I.B.A., architects, Leek and Hanley. Quantities by the architects:—
George Ellis ... £3,332 James Heath ... £3,125
T. Godwin ... 3,227 W. Thorley ... 3,075
J. Bagnall ... 3,200 S. Warburton ... 2,685
J. Fielding ... 3,156 Thomas Grace* ... 2,660
*Accepted.

S. Salt ... Contract 1 only. ... £1,900

Contract 2 only.
Heath and Lowe ... £710 0 0 G. Hine ... £250 0 0
Bayley and Morris ... 613 13 4 T. Mackrell ... 462 15 0

Contract 3 only.
G. T. Stevenson ... £199 15 0 C. Robinson ... £174 0 0
E. Phillips ... 190 0 0 M. Carding ... 172 0 0
J. Ratcliffe ... 184 0 0 I. Heath ... 165 0 0

LONDON.—For building stabling, &c., Ever-street, Southwark, for Mr. C. Giles. Mr. Chas. Young, architect, London:—
Holland and Hannen ... £10,879 B. E. Nightingale ... £3,670
Mowlem and Co. ... 10,796 Thos. Boyce ... 8,583
A. Bush ... 8,798 Waring and Son ... 8,410

LONDON.—For erecting four shops in Askew-road, Shepherd's Bush, W., for Mr. T. H. Currie. Mr. A. T. Fullick, architect, 52, Eyot-gardens, Hammersmith, W.:—
F. G. Minter ... £3,549 0 0 T. W. Thomas ... £3,485 0
F. G. Minter ... 3,520 0 C. Johnson ... 3,479 0
B. Wimpey and Co. ... 3,432 10 T. Bendon ... 3,297 0

LONDON.—For pulling down and rebuilding "The Globe" public-house, New Compton-street, Soho, W., for Mr. L. Ellis. Mr. T. Walter Moss, architect. Quantities by Mr. A. J. Gate:—
Summerford and Son ... £3,950 W. Irwin ... £3,436
George Wade ... 3,833 C. Ansell ... 3,399
Drew and Cadman ... 3,597 Ham & Son (accepted) ... 3,297

LONDON.—For rebuilding 12, Jewin-crescent. Mr. L. Solomon, architect, 55, New Broad-street:—
Higgs and Hill ... £1,840 Perry Bros. ... £1,337
Holloway ... 1,756 Davies ... 1,330
Hall, Bedall, and Co. ... 1,530 Beer and Gash ... 1,287
Patman and Fotheringham ... 1,491 Consell ... 1,293
Reason ... 1,199

LONDON.—For the erection of house, Great Portland-street, for Mr. J. A. Mitchell. Mr. T. H. Smith, architect. Quantities supplied:—
Goode and Son ... £3,323 Webber ... £2,674
Beer and Gash ... 3,039 Staines ... 2,645
Holloway ... 2,930 N. Lidstone ... 2,617
Baxter ... 2,850

LONDON.—For the erection of a warehouse, No. 1, Paradise-row, Bethnal Green, E. Mr. Richard Peters, architect and surveyor, 73, Wool Exchange, E.C.:—
Salt ... £2,345 Marriage and Co. ... £2,100
Jarvis and Sons ... 2,115

LONDON.—For the erection of three shops and a beer-house, Ben Jonson-road, Stepney, E. Mr. Richard Peters, architect and surveyor, 73, Wool Exchange, E.C.:—
Salt ... £3,940 T. Parker ... £3,795
Jarvis and Sons ... 3,875

LOWESTOFT.—For additions, &c., to Town Hall, for the Town Council. Mr. G. H. Hamby, C.E., Town Hall, Lowestoft:—
Jno. Ashby ... £3,850 C. R. Cole ... £3,496
Allerton and Darl ... 3,800 G. E. Hawes, Norwich* ... 3,395
J. and B. Swatman ... 3,500
*Accepted.

MIDDLETON ST. GEORGE (Co. Durham).—For the erection of superstructure, &c., of private asylum. Mr. J. W. Dyson, architect, 67, Grey-street, Newcastle-on-Tyne. Quantities by the architect:—
S. F. Davidson ... £14,495 0 0 Thomas Beetham,
G. Marshall & Son ... 13,806 12 6 West Hartlepool* £13,160 5 0

THOROUGHLY FLUSHED WITH TWO GALLONS OF WATER
PERFECTO SEAT EXTENSION.

PORCELAIN SOLDERED JOINT.

Made in "Vitro-Porcelain," a new body, vitreous throughout, non-absorbent, and non-crazing. The best material for Sanitary Appliances ever introduced.

Prices and Particulars on Application.

SHANKS & Co., Tubal Works, Barrhead, near Glasgow.

CONTRACTS OPEN.

MIDLAND RAILWAY.

TO BUILDERS, PAINTERS, AND CONTRACTORS.

The Directors of the Midland Railway Company are prepared to receive Tenders as follows:—

Extension of Locomotive Offices, Grimesthorpe, Sheffield.

Cleaning and Painting Station Buildings, &c., at Rearsby, Brooksby, Frisby, Asfordby, Melton Mowbray, Saxby, Whissendine, Ashwell, Oakham, also at Edmondthorpe and South Wi ham.

Cleaning and Painting Engine Sheds Nos. 1 and 2 at Childs Hill.

Cleaning and Paint Engine Sheds, &c., at Kettering and Northampton.

Specifications may be seen and quantities obtained on application to the Company's Architect, Cavendish House, or at the Engineer's Offices, Derby Station, on and after JUNE 11th, 1898.

Sealed Tenders to be forwarded by post to the Secretary of the Way and Works Committee, Midland Railway, Derby, not later than NINE a.m. on JUNE 16th, 1898.

The Directors do not bind themselves to accept the lowest or any Tender, nor to pay any expenses attending same.

Derby, June 7th, 1898. JAMES WILLIAMS, Secretary.

CARL HENTSCHEL & CO.

Photo-engravers,

Electrotypers,

AND

Designers.

HEAD OFFICES:

182, 183 & 184, FLEET ST., E.C.,

1 & 2, Goldsmith Street, Gough Square, E.C.

Branch Offices:

WORKS and REPAIRS to MILITARY BUILDINGS in the UNITED KINGDOM (including PAINTING).

The Secretary of State for War hereby gives notice that Builders desirous of being applied to when TENDERS are invited for work in the Military District should address the General Officer Commanding, giving trade and bank references, and stating whether they wish to Tender for (A) Jobbing Work, Painting, and Repairs, (B) New Buildings or Works up to £5000 estimated value, or (C) New Buildings or Works of any magnitude.

Applications unaccompanied by references will not be noticed.

Firms whose names are already on the War Office list need not apply.

A. MAJOR,

Director of Army Contracts.

War Office, Pall Mall, S.W., June, 1898.

NEW CHURCH of ST. STEPHEN, PORTSEA.

The Committee are prepared to receive TENDERS for the ERECTION of a CHURCH to accommodate 700 people in accordance with plans and specification prepared by Mr. REGINALD A. CROWLEY, A.R.I.B.A., of 22, High street, Croydon. Builders wishing to Tender may obtain a copy of the bills of quantities and form of Tender from the Architect, on payment of a deposit of Three Guineas, which will be returned on receipt of a bona-fide Tender. Applications for quantities must be sent in on or before WEDNESDAY, JUNE 12th.

No Tender will be recognised unless made on the prescribed form, properly filled up in every respect, sealed, endorsed "Tender for St. Stephen's Church, Portsea," and delivered at the Architect's Office by TWELVE

o'clock noon, on WEDNESDAY, JUNE 22nd next, and no expenses will be allowed or paid to any persons whether tendering or not. The Committee does not bind itself to accept the lowest or any Tender.

The plans, specification, and draft contract may be seen between JUNE 8th and 22nd, at the Architect's Office, and at the Buckland-road Post Office, Portsmouth.

REGINALD A. CROWLEY, Architect.

PALMER'S ENDOWED SCHOOL, GRAYS.

The Governors of Palmer's Endowed School, Grays, invite TENDERS for the ERECTION and ALTERATION of SCHOOL BUILDINGS, at Grays.

Plans, specifications, and form of contract may be inspected, and bills of quantities may be obtained (on depositing the sum of £5, which deposit will be refunded to those persons who send in bona-fide Tenders and return quantities) at the office of the Architect, Mr. C. M. SHINER, A.R.I.B.A., No. 2, Walbrook, E.C., and Grays.

The Governors do not bind themselves to accept the lowest or any Tender.

Trades Union District rate of wages must be paid.

Tenders, sealed and endorsed, together with quantities in a separate sealed and endorsed packet, are to be delivered to me at my office, Orsett-road, Grays, not later than JUNE 20th, 1898.

Grays, Essex, May 27th, 1898. THO. A. CAPRON, Clerk to the Governors.

IRON ROOFS, WORKSHOPS, CHURCHES, PRINCIPALS, AND GIRDERS.

Builders' Notes.

WHILE the Liverpool city authorities are engaged on the scheme of widening several important thoroughfares in the central portion of the city, at a cost of some hundreds of thousands of pounds, might it be suggested that it would be advisable for them to make all new main roads much wider than they are? There are several main roads in the outskirts of Liverpool in which a greater width could be retained with considerable advantage, and at a minimum cost, but which years hence, when they have to be widened, will necessitate the expending of a large sum of money, as property is being rapidly erected.

IN a report of the Parliamentary Committee of the St. Pancras Vestry a strong opinion is expressed that it would be a great public advantage if the metropolitan local authorities had power to regulate the opening-up of streets, as at present, under the powers possessed by them; gas, water, and other companies are free to make such openings without any system and as often as they choose and when they choose. Hence the frequency with which thoroughfares are disturbed, to the obstruction and inconvenience of the travelling public. It is suggested that the London County Council should, in one of their General Powers Bills, seek power to enable the local authorities to regulate the opening-up of streets otherwise under their control.

IN respect of an action which has been pending in the Glasgow Sheriff Court for some time in connection with the collapse of the building in New City Road, in November, 1896, Mr. Sheriff Strachan has issued the following interlocutor:—"Having heard parties' procurators, and considered the proof and productions, finds that on 30th November, 1896, a tenement, consisting of shops and dwelling houses, which the pursuer was in the course of erecting on a stance belonging to him in New City Road Glasgow, collapsed when it had been roofed and slated, finds that the said collapse was caused by the negligence and want of skill on the part of those by whom the tenement was erected after the defender had given up the contract (1) by placing three columns supporting the longitudinal beams on which the upper stories principally rested on a retaining wall of common rubble masonry entirely insufficient for the purpose; and (2) by failing to provide and put in the necessary supports shown on the plans sanctioned by the Dean of Guild Court; finds that the defender, while employed under the said contract, did nothing which in any way caused or contributed to the said collapse, and that he is in no way responsible therefor; therefore absolves him from the conclusions of the action and decerns; finds the defender entitled to expenses, including a debate fee of £5, and remits the account to the Auditor of Court to tax the same and report."

MR. S. STANLEY BROWN, in a paper on "Compensation for Accidents to Workmen in the United Kingdom," recently read before the International Congress of Actuaries, dealt with the consideration of the cost of the Workmen's Compensation Act. Stating his conclusions in the order of the accident and using the cost of each case and the number of each class as multipliers, he was enabled to determine the cost per cent. of wages for the different classes and the total, which showed in the result a pure loss ratio of 19s. 4d. per cent. of wages paid. To this, of course, had to be added the various expenses, including medical service, the observation of accident cases to prevent malingering, the cost of arbitration and litigation, control, management, and profit. The gross addition of all these items was 66 per cent., raising the rate from 19s. 4d. to nearly 32s. 3d. per cent. on the wages. If this average rate of 32s. 3d. per cent. to the traders coming within the operation of the Act—taking the number of persons employed at five millions and the

annual wages at £350,000—were calculated, it followed that there was an insurable interest in connection with this liability, represented by a premium of nearly £5,700,000 per annum. Using the numbers of accidents which were assumed to happen under this new law, and comparing its effects with the law of the beginning of this century, he said that there was no doubt that whereas one accident was compensated under the old systems forty accidents would be compensated under the new.

THE Trans-Siberian Railway, to which we referred a fortnight ago, is advancing very rapidly on the branch to Listvinitchna, which it is hoped to finish before August. The construction of the temporary wooden bridge over the river Irkout and the earthworks along the left bank of the Angara to Lake Baikal are already finished, but the rails have not yet been laid down. On Baikal itself active preparations are being made for placing the necessary landing stages and moles, which will be adapted for the direct transference of the trains on to an ice-breaking ferry barge. There is every reason to believe that between now and the end of next year the Listvinitchna branch will have been finished, together with the organisation of the necessary landing stages and ferry boats on Lake Baikal. Finally, 62 per cent. of the earthworks on the trans-Baikal section have been executed, and the necessary quantity of rails to complete the section as far as Stratsensk have been got in readiness, and the placing of them in position can be done in time for the opening of navigation on the Amur in the year 1900, and there will then be unbroken communication, partly by rail, partly by steamer, to as far as Vladivostok. At the present time, although the rails are only laid for half the line, the means of transport, calculated at three trains a day in each direction, are insufficient. That is proved better than anything else by the following figures: In 1896 there were conveyed over the West Siberian section 10½ million pounds of merchandise, and in 1897 21 million pounds, or the double, and in proportion as the line extends this amount will increase. In order to increase the number of trains in each direction to seven a day, 10 to 15 million roubles will have to be laid out, and over and above that a further 24 million roubles will be needed to increase the rolling stock by 300 engines and 10,000 trucks. Again, the railway in its present state is incapable of sending its trains at a more rapid rate than 25 kilometres an hour, whereas to meet the demands on the line, not only as a Russian national railway, but as a universal international railway, this speed must be increased to 40 or 50 kilometres an hour. To do this heavier rails will have to be substituted for those in use, stone bridges must be constructed in place of the existing ones in wood, and these with other alterations will entail a fresh outlay of 50 million roubles. There is no reason to believe that the Russian Government will recoil before these large amounts that are necessary to perfect the gigantic enterprise it has in hand.

A LOCAL GOVERNMENT BOARD enquiry has been held at Kessingland, relative to the application of the Rural District Council to borrow £1200 for the purposes of sewerage and sewage disposal for the parish.

DR. J. S. CAMERON, Medical Officer of Health for Leeds, in a recent lecture on sanitation, dwelt on the evils which existed in two-thirds of the "back-to-back" houses of Leeds from the leakage of pipes leading down the dividing wall to the sewer, and whence poisonous fumes were liable to escape into the house; and also to the insanitary "slums" of the city. Both these evils, added the lecturer, the Corporation had been and was turning its attention too, with a view of speedy remedy. Dr. Cameron showed one diagram illustrating an insanitary area which the Corporation had almost completely purchased, and where the present unhealthy arrangement of the buildings upon it was to give way to properly laid-out rows of houses.

Surveying and Sanitary Notes.

THE Corporation of Douglas has decided to increase its water supply by the construction of a reservoir at West Baldwin capable of containing 300 million gallons. The holding capacity will be six times that of the Clyde Reservoir.

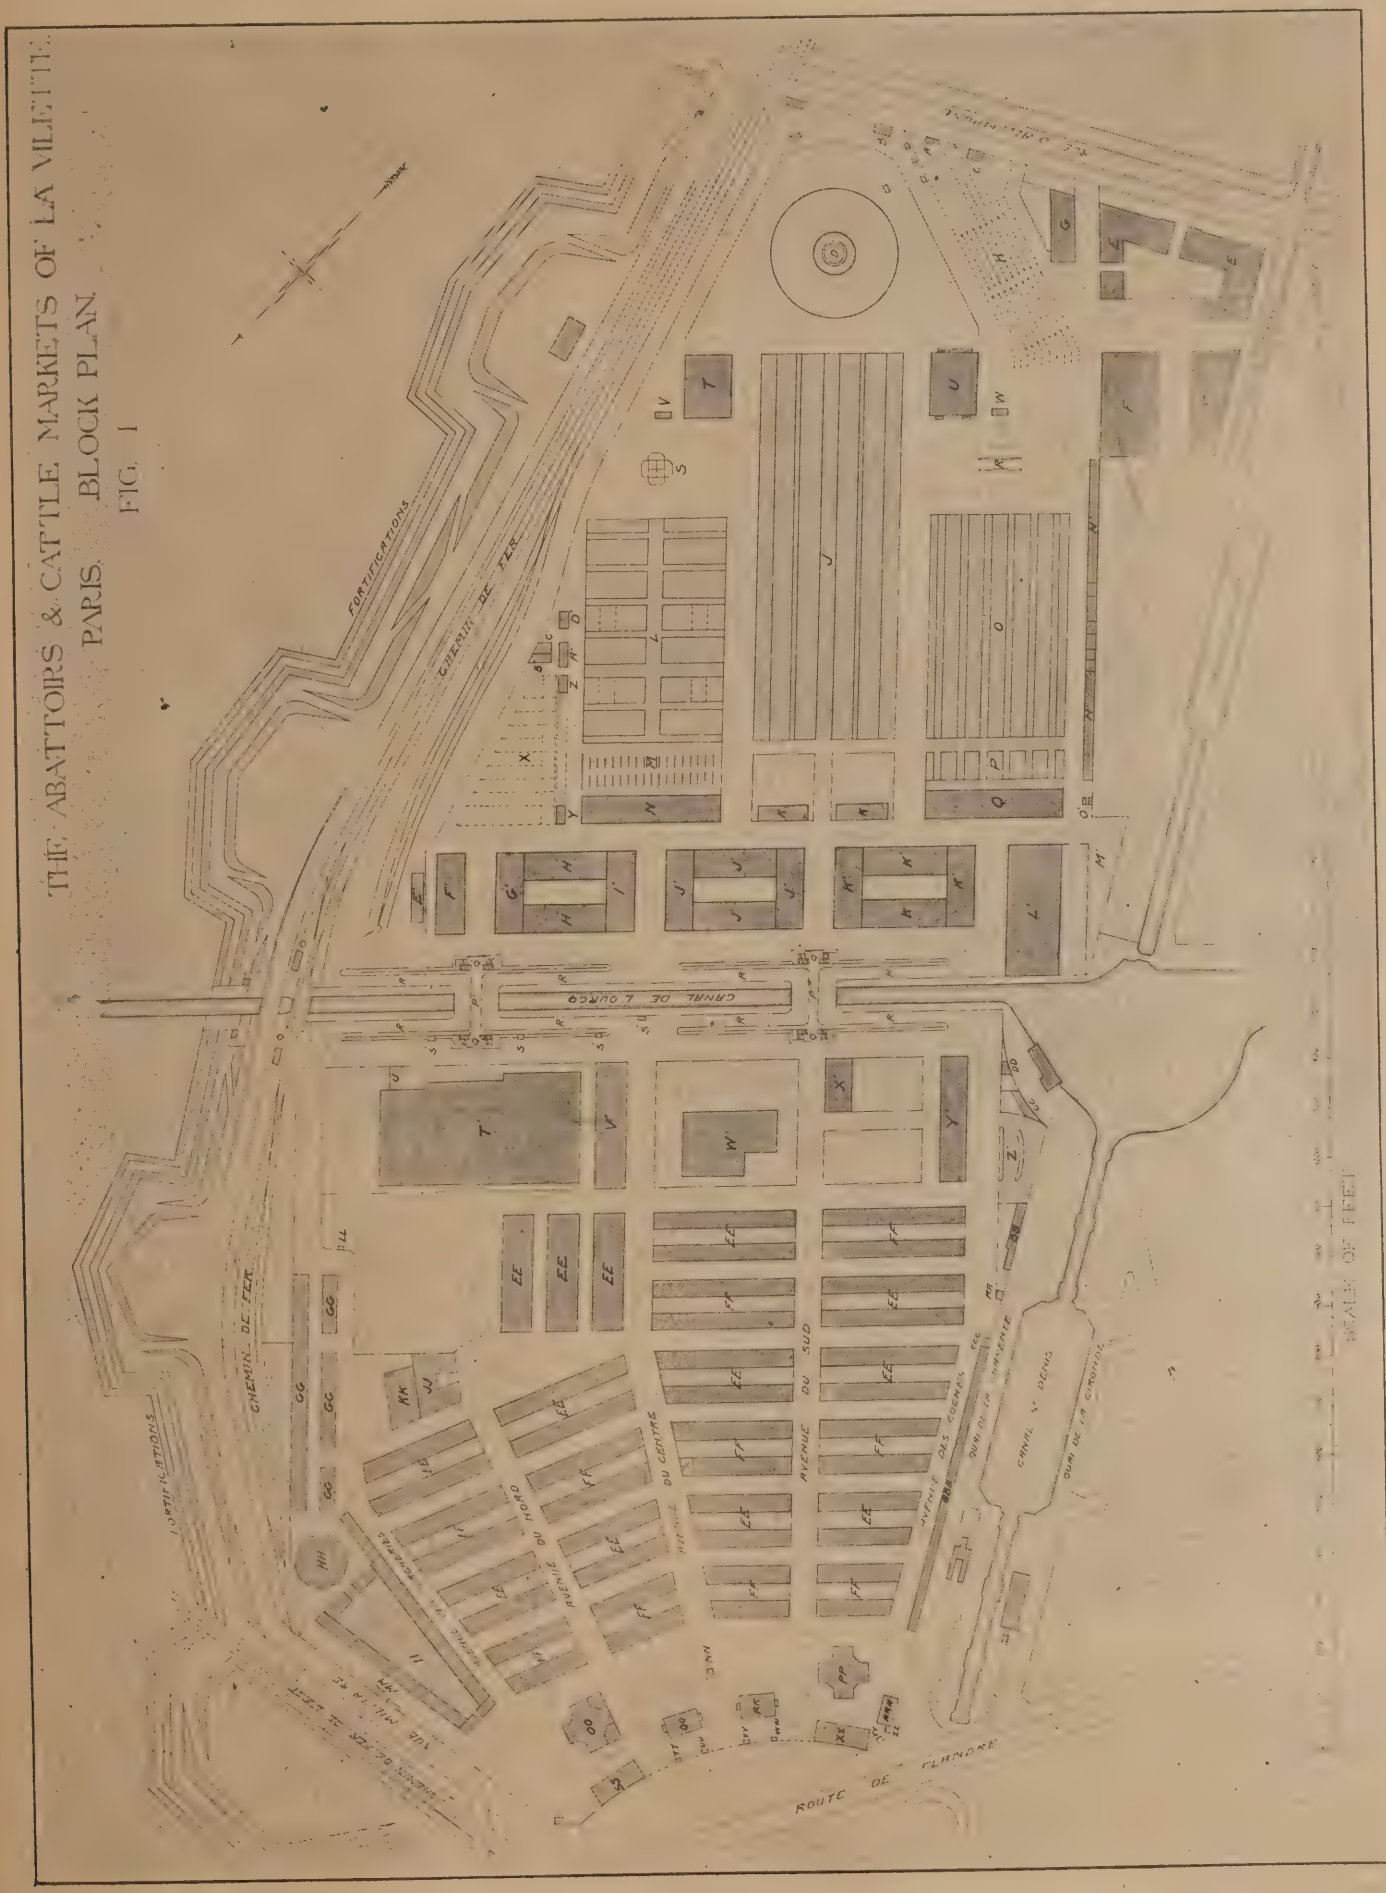

THE Hambledon District Council has been fined £45 by the Guildford bench for polluting tributaries of the Thames. The Middlesex rural authorities are not charged with wilfully polluting the Brent, but that tributary of our great river has become a terrible nuisance, and an almost certain focus of epidemic disease.

FOR many years the medical officer of health has drawn attention to the insanitary condition of the subsidiary drains in Plymouth, and the necessity of doing something in the matter being realised by the Sanitary Committee, they forwarded a request to the Works Committee to take action on the lines suggested by Dr. Williams. Mr. Paton was thereupon called upon to conduct a series of investigations, and as a result he recommended that the borough should be divided for the purpose into thirteen sections for successive treatment. In his report to the Works Committee, the surveyor described some of the subsidiary drains as being like a basket, in and out of which the sewage flowed, and he expressed the opinion that the necessities of the case would not be met to any appreciable or permanent extent by cleaning them out.

THE Local Government Board has intimated that they will assent to a loan of £40,000 being raised by the Exeter City Council for the purpose of carrying out the Cameron scheme for disposing of the sewage by the aid of the septic tank. Under this system the sewage is destroyed by bacteria. The enquiry held a short time since was attended by representatives of sanitary authorities from all parts of the kingdom, and the report of the Local Government Board has been awaited with the greatest interest. The promoters maintain that the effluent should run over land before entering the river, and they stipulate that there should be attached to the works an acre of land for each 2000 of the population. The complete scheme will not cost half the amount the Council were prepared to spend on the old system of precipitation and chemical treatment, and the annual expense will be infinitesimal. It will be noticed, however, that the Local Government Board have not abandoned their attachment to the principle of land being a *sine qua non* in the disposal of sewage.

SITUATED as Liverpool is, on the margin of the sea, with a fine river flowing through it, the great seaport ought to be exceptionally salubrious. But, instead of that being the case, its death-rate always comes out among the highest in England. Not without reason, therefore, is the local intelligence beginning to display curiosity as to the cause of such exceptional mortality. Various theories are propounded by newspaper correspondents, and perhaps the most reasonable is the view put forward by a few correspondents that overcrowding, bad drainage, and lack of open spaces combine to inflate the death-rate. It is asserted that there are tens of thousands jammed together in ill-ventilated rooms, where the air at night becomes unbreathable by ordinary lungs. Nor is the external atmosphere much purer in these congested localities; what between exhalations from the sewers and the paucity of public gardens, the lungs of Liverpool men who live in the slums never have a chance of performing their proper functions. In short, the picture presented by these candid critics is that of a great, wealthy, and prosperous English city ready swept and garnished for the reception of Asiatic cholera.

THE ABATTOIRS & CATTLE MARKETS OF LA VILLETTE.
PARIS. BLOCK PLAN.
FIG. 1

PARIS ABATTOIRS. FIG. 1.

PARIS ABATTOIRS.*

BY R. STEPHEN AYLING, A.R.I.B.A.

INTRODUCTION.

THE Report of the Royal Commission on Tuberculosis in cattle has recently been presented to the House of Commons, and the main recommendations of the Committee are in the direction of providing that cattle shall be killed in duly licensed slaughter-houses.

Municipalities in England, Ireland, and Wales are to be empowered to erect public abattoirs, and to suppress the existing slaughterhouses, after giving three years' notice. It is therefore probable that a large number of these buildings will be erected during the next few years, and it is to be hoped that they will be on the same broad and comprehensive scale as in most of the Continental cities.

At the present time we have in London only the Deptford Market for killing foreign cattle, which is very faulty in plan and arrangement. Although some of the largest provincial towns have public abattoirs, they are almost invariably built on sites too small to admit of the necessary accommodation. In some cases the lairs for animals to be killed are placed over the slaughterhouses, necessitating the use of lifts and slopes.

Innumerable small private slaughterhouses exist in London, many in the heart of densely populated districts, and apart from a sanitary aspect, they certainly present a demoralising influence on children of both sexes.

Although they are under the supervision of sanitary inspectors, it is impossible for these officials to control them as efficiently as when the buildings are grouped together on one site.

One cannot but feel the great advantage of centralising the killing of cattle under sanitary conditions and with a proper organised system of inspection, both before and after the animals are slain, so that the risk of meat reaching the consumer, which is unfit for food, is reduced to a minimum.

At present, trade opposition is against the erection of public abattoirs and the necessary closing of private slaughterhouses, but exactly the same difficulty was experienced in Paris and successfully overcome.

When the Manchester abattoir was about to be built, under the direction of Mr. A. Darbyshire, F.R.I.B.A., in 1873, the local butchers were strongly adverse to the scheme, and formed an association to protect their interests. Instead of obtaining compulsory powers to close the private slaughterhouses, the Committee wisely conferred with members of the trade, and after discussion the butchers themselves finally saw the advantage of a public abattoir with every convenience, and eventually were not only friendly disposed but gave every assistance to its development.

There can be no doubt whatever that the system adopted in Paris and other Continental cities is in every way superior to that in England, and one looks forward to the time when we shall not be behind our neighbours in effecting a much-needed, if radical, change.

Before describing the abattoirs of La Villette and La Rive Gauche, it may be interesting to give a short history of the laws which led eventually to the formation of these buildings.

For many years previous to the erection of the buildings at La Villette, it had been fully recognised that the system of each butcher killing his own cattle (often under insanitary conditions) was a bad one, and that the animals being driven through the city to the slaughterhouses constituted a grave source of danger. As early as the sixteenth century a law was passed to the effect that "The killing and skinning of all beasts should be outside the city and near the river." Notwithstanding the efforts of the civic authorities to carry this law into effect during the seventeenth and eighteenth centuries, the opposition offered by

five abattoirs, three on the left bank and two the butchers was so strong as to render the law practically futile. It was not until 1810 that a law was passed ordering the erection of on the right bank of the river. Later on others were added on the right bank, but they were all eventually closed and superseded by the abattoirs of La Villette.

In the present series of articles I propose to firstly deal with this group of buildings and afterwards with the yet unfinished buildings at La Rive Gauche.

They differ greatly in principle, and whilst at La Villette there are immense markets for the sale of live cattle, at La Rive Gauche this is not the case.

Very many serious defects found from practical experience at the former have been remedied in the plans adopted at the latter, and these will be treated in detail later on.

THE CATTLE MARKET AND ABATTOIRS OF LA VILLETTE.

These buildings were erected from the designs and under the superintendence of Mon. Janvier, architect, and were opened in 1867.

They are situated in the north-east part of Paris, within the fortifications and on the line of the Chemin de Fer de Ceinture, and are in connection with the Canals St. Denis and l'Ouercq. Fig. 1 shows a complete block plan of the buildings.

It is difficult to over estimate the great advantage of the site being bounded on the northern side by the railway, for by this means the abattoirs are brought into direct communication with all the other railways.

The live animals are thus conveyed immediately into the markets without the necessity of having to traverse the streets, which in addition to being dangerous, seriously deteriorates the flesh of the animal when killed.

The site occupied by the whole establishment is about 105 acres, and broadly speaking is two-thirds of a mile long by one-third of a mile wide.

Some idea may be obtained of the magnitude of these buildings from the fact that during one week in July last 72,809 heads of cattle were sold and killed, viz., 51,164 sheep, 7496 beasts, 9725 pigs, 2817 calves, 509 taureaux, and 1098 cows.

The site is divided in the centre by the canal de l'Ouercq, the southern half containing the large cattle markets and buildings for stabling some of the animals, and the northern half comprising the slaughterhouses and additional stables for cattle.

The principal entrances are in the Rue d'Allemagne, and it is through these gates that the few animals brought in carts or on foot are taken. At the end of the Rue d'Allemagne is a level crossing over the railway.

The general arrangement for dealing with the work is as follows:—Mondays and Thursdays are devoted to the selling of cattle, Tuesdays and Fridays to killing and dressing, and Wednesdays and Saturdays to carting, although each kind of work is carried on continually in some portion of the markets.

Adjoining the entrance gates in the Rue d'Allemagne are three small buildings, A. (Fig. 1) for the use of the Concierge B. (Fig. 1), for the Officers of the Octroi (or city toll) and C. (Fig. 1), is the station for the Sapeurs Pompiers (fire brigade).

Between these gates and the large central market is an immense courtyard, and in the centre the old Fountain D. (Fig. 1) which was brought here from the Place de Chateau d'Eau.

It consists of three tiers of basins with lions on pedestals spouting water in the lower basin which is about 80ft. in diameter.

At the south-west corner of the site are the "Bouveries de la Rue d'Allemagne" (E. Fig. 1), and also two other blocks of "Bouveries" (stables for beasts) (F. Fig. 1).

(To be continued.)

A JUBILEE fountain has just been opened at Hampton Wick.

BURRATOR RESERVOIR.

THE Burrator Reservoir, which is to provide Plymouth with an abundant and constant supply of water for the next fifty years, is approaching completion, and will, it is expected, be opened in September. The works, from the designs of Mr. Mansergh, M.I.C.E., and being carried out by Mr. E. Sandeman, M.I.C.E., the borough water engineer, are situated on the fringe of Dartmoor, and form an artificial lake, $1\frac{1}{2}$ miles long by half a mile wide, and holding 650 million gallons. At its deepest part the water is 77ft. deep. The masonry dam, which crosses the valley at Burrator, will be 363ft. long at the water level. At the lowest point of its base it is 77ft. thick, the average thickness at the river bed is 62 $\frac{1}{2}$ ft., and the width at the top is 21ft.

ABOVE THE DAM PROPER

will be a roadway carried over the centre of the structure by five arches, each with a 25ft. span. Between these arches the overflow water will pass out over the dam when the reservoir is full. At the sides the roadway, which will be 18ft. wide and 11ft. above the top of the dam, will be supported by a wall of concrete. In excavating for the foundations it was found necessary to go down 53ft. below the bed of the river, and the height of the massive structure from the lowest point excavated to the top of the roadway will be 129ft.; 29,000 cubic yards of material were taken out in the course of the excavation. All the fissures in the granite on both sides of the valley and below the river bed have been cut out by hand labour, no explosive being used in the excavations to avoid creating any further cracks and crevices in the rock. The process was necessarily slow and tedious, but the engineers and Water Committee know that the dam rests

ON A SOLID BED OF ROCK

without a crevice or crack. The face and top of the dam have been constructed of uncoursed ashlar, consisting of square blocks of granite, and the core of the structure is composed of "cyclopean rubble," consisting of large masses of granite embedded in concrete. The construction of the core, says the Public Health Engineer, is peculiar. The granite blocks, some of them weighing several cwt., are placed as close together as possible without touching. Each stone before being put in position is carefully washed and scraped, then bedded in 4in. of cement, battened down by heavy malls, and then filled round with concrete. Another peculiar feature in the construction of the dam has been the jointing of the granite blocks forming the face. On the side of the dam which has to resist the water pressure the granite blocks have been rebated to a depth of 6in., leaving a space three-quarters of an inch wide to that depth between each of the blocks. These spaces have been filled in with neat cement, slightly damped, and driven in by an iron chisel. By this process an exceedingly

HARD AND WATERTIGHT JOINT

has been obtained, so as to make the face of the dam impervious, and prevent water percolating into the core of the structure. For a considerable portion of its length, especially in the centre, the dam itself is now complete, and workmen are busily engaged in placing the top stones in the other sections. The piers, which will support the arches of the roadway, are also finished, and the construction of the arches has been commenced. At the sides the masonry support for the roadway has been carried above the top of the dam proper to within 8ft. of the level of the intended road. In the early stages of the construction of the dam the River Meavy was diverted from its old bed and carried temporarily over the site by a lander. Later, as the work progressed, a tunnel, 10ft. in diameter, was made through the dam on a level with the old river bed. The river now flows through this tunnel, and it is intended shortly to lay two pipes through it, conveying water to the line of pipes now running from Burrator to

* The series, of which this article is the first, deals with the construction of the Cattle Markets and Abattoirs of La Villette and La Rive Gauche, Paris.

UNIVERSITY OF ILLINOIS

borough. When these pipes are in position, the time for impounding the river arrives, the tunnel will be permanently closed by an iron shield placed over the entrance, and the interior filled up with concrete. There is also steel pipe, 30in. in diameter, through the dam at a higher level. Its present purpose is to feed the leat, but it will form eventually a supplementary means of feeding the pipes supplying the town. A second tunnel, 6ft. high and 2ft. wide, runs longitudinally through the dam, through which, after the works are completed, the interior of the dam may be expected. Besides putting the finishing touches to the top of the dam, and the erection of the superstructure, with its five arches spanning the roadway above, there remains to be done, at the top of the dam, the fixing of machinery for working the valves, the

CONSTRUCTION OF SCREEN CHAMBERS.
Other subsidiary works on the lower side of the structure. Further up the valley near the village of Sheepstor a secondary dam, intended to prevent the overflow of the reservoir at a point where the land dips a little, has been constructed. Except for the facing of the side, which will be exposed to the water, this dam is now complete. Only a few feet above the level of the ground this dam would have been a minor feature of the works,

but for the excessive depth to which the engineers had to excavate for the foundations. In cutting the trench a large number of veins of rock of a porous character were found, which had to be removed entirely, with the result that the trench was excavated at its deepest point, 108ft. below the surface, before solid rock was reached. This unexpected difficulty gave the engineers much greater anxiety than anything else connected with the entire work. Having made the trench, a layer of concrete was laid at the bottom. On this

A WALL OF CONCRETE

5ft. thick was built up for a height of 80ft. From this point to the top the watertight core of the dam is formed of clay, tied to the concrete in a wedgeshape foundation. This embankment is 700ft. long, and 10ft. wide at the top. In substitution for the old Sheepstor Road, which will be submerged by the reservoir, a new road has been constructed from Millicroft Barn to the dam, and on the other side of the valley a similar road is in course of construction from the dam to the village of Sheepstor. Among the minor works remaining to be done is the erection of a small masonry dam at the head of the valley to intercept any stones or debris which might be brought down by the winter floods, and so prevent the silting up of the reservoir.

Trade and Craft.

NOVEL INTERIOR WALL CONSTRUCTION.

A new departure in interior wall construction is being made at the Mosley Hotel, Manchester. The basement of the building is undergoing sub-division into a number of rooms by means of partition walls of plaster of Paris. First of all the wall, which is only two inches and a half in thickness, is made in small square slabs, a portion of which is hollow. The slabs are placed in position and joined together by cement, the hollows being filled in with the same material. The invention, a German one, is known as the Bruckner Plate Wall, and the advantages claimed for it are its comparative lightness, strength, and durability, and that it is fire and sound-proof. The wall, too, is soon erected, the surface is smooth, and it can be painted or papered without drawback an hour or two after completion. The estimated cost is about six shillings per square yard. The plate wall is extensively used in Germany and France, and is said to have given complete satisfaction.

A new and handsome two-manual organ has been introduced in St. Columba Parish Church, Oban, at a cost of over £600.

COMPLETE LIST OF CONTRACTS OPEN.

NO. OF TENDERS.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.

PROPERTY & LAND SALES.

A COMMANDING BUILDING suitable for club, hotel, restaurant, theatre, music-hall, stores, flats, religious or philanthropic institution, or for commercial firms requiring large space.

OXFORD MANSION, Oxford-circus, London, W. To be SOLD by TENDER, on JUNE 30th next, this well-known BUILDING, of striking elevation and fire-proof construction, standing on nearly ½ acre, with four frontages of 100ft., each within a few yards of the new Oxford-circus station of the Central London Railway, six stories, floor space about 54,700 superficial feet, 133 rooms and a large central hall and basement. Artesian well. Portland lease 56 years.

For particulars and forms of Tender, apply to
LEGGATT RUBINSTEIN and CO., Solicitors,
5, Raymond-buildings,
Gray's Inn, London, W.C.

WEMBLEY, MIDDLESEX.

A number of IMPORTANT FREEHOLD BUILDING SITES, comprising portions of the highly favoured Building Estate known as "HARROWDENE," about three minutes' walk from Sudbury Station, on the L. and N.W.R., and about one mile from Wembley Park Station, on the Metropolitan and District Railway. The plots all occupy capital positions on the rising ground to the west of the first-mentioned railway, and possess **GOOD FRONTAGES TO THE HARROW-ROAD**, the Harrowdene-road, and Crawford-avenue, with depths varying from 200 to 300ft. The Estate is laid out with 50ft. roads, planted with trees, and provided with means of lighting; house connections are laid; gas and water mains are put in throughout; and the carriage-ways have been taken over by the Local Authorities. The best of the sites are eminently suitable for the Erection of Residences ranging from £60 to £100 per annum, whilst others are intended for Villas with rentals of from £35 to £40 per annum.

MESSRS. WALTON and LEE will OFFER the above for SALE by AUCTION, at the Public Offices, Wembley, on THURSDAY, JUNE 23rd, 1898, at SEVEN o'clock p.m. precisely.

Particulars may be obtained of Messrs. FLADGATE and Co., Solicitors, Craig's Court, Charing Cross, S.W.; or of the AUCTIONEERS, at their Offices, 10, Mount-street, London, W.

TO BUILDERS.—FREEHOLD BUILDING

LAND.—West Green Lodge, West Green-road, Tottenham, almost immediately opposite the West Green Station. To LET, by TENDER, on JUNE 24th, 1898, a very eligible piece of LAND, with frontages to three made roads, ripe for building, and suitable for the erection of eleven shops and nineteen small private residences. For forms of Tender apply to Mr. C. E. JACKSON, Architect, and Messrs. GEO. and WM. WEBB, Solicitors, 39, New Broad-street, E.C.

TO BUILDERS AND OTHERS.—Messrs.

FULLER, HORSEY, SONS, & CASSELL, are instructed by the proprietor, who is retiring from business, to SELL by AUCTION in lots, on the PREMISES, 38, Boundary-road, St. John's Wood, on WEDNESDAY, JULY 6th, at TWELVE o'clock precisely, **BUILDER'S PLANT and MACHINERY**, including a combined circular saw bench and irregular moulding machine, a 42in. drag saw bench, mortising and boring machine, vertical engine and boiler, shafting, 200 scaffold poles, 20 dozen cords, 400 scaffold boards, putlogs, steps, ladders, benches, cramps, &c.; stock of well-seasoned timber, comprising about 1000ft. super mahogany, 1500ft. super wainscot, cut stuff, quartering, mouldings, 50 squares flooring and matching; also 30cwt. white lead, oils, turps, varnishes, and painters' materials, blocks, jacks, plumbers' brass work, solder, sheet lead and pipe, ironmongery, &c.; 2 spring carts, hand truck, chaff-cutter, and other effects.—May be viewed by order, and catalogues had on the premises, and of the AUCTIONEERS, No. 11, Billiter-square, E.C.

CHEAP FREEHOLD BUILDING LAND.

Ripe for development by a formation of roads, and plotting, either for re-sale, or building upon at once attractively designed detached houses, and pairs of moderate size, &c. It is situated within about half a mile of the High-street, and a trifle over a mile from the Station at Sutton, Surrey, possesses a very long frontage to excellent hard road. The spot is very rural, and high and dry. Area about 80 acres. Details to principals only.—ALEX H. TURNER and Co., 199, Piccadilly.

TO BUILDERS.

The Freeholder of a large suburban Estate (S.W.) wishes to meet with ONE or TWO BUILDERS accustomed to building good-class suburban property of from £60 to £120 a year rental. Main road, prettily wooded sites for houses. Plenty of ground to each plot, several having tennis lawns; main drainage; cricket and tennis clubs and three golf courses within a mile. Eight miles from Royal Exchange. Some shop plots adjoining railway station on main road. The land will be sold or let with restrictions, and advances can be had. Unquestionably one of the best things going at the present time for the right man.

Freeholder's Surveyors and Architects, Messrs. CHESTERTON and Sons, 51, Cheapside, E.C.

TO BUILDERS.—£1200 profits in ground rents. For SALE, FREEHOLD BUILDING LAND. Popular seaside town (Kent). Splendid main road frontages. Price £1800. Can let to numerous builders.—Address, MARTIN and Co., 5, Bouverie-chambers, Bouverie-street, E.C.

STOKE NEWINGTON, close to park.—BUILDING LAND to be LET. Improved ground rents. Would be purchased or freehold sold. Advances made.—Messrs. WM. EVE and Sons, Surveyors, 10, Union-court, Old Broad-street, E.C.

PUTNEY and WANDSWORTH (midway between).—Fourth and Final Sale of Freehold Building Lots, close to a railway station. Free conveyances. Deferred payment.

MESSRS. TUCKETT and SON are instructed by the Trustees of the late James Spencer Bell, Esq., to SELL by AUCTION, at the WHITE LION, High-street, Putney, on THURSDAY Evening, JUNE 16th, at SIX o'clock, the FOURTH and FINAL PORTION of the WOODLANDS ESTATE, in numerous lots, land tax redeemed and tithe free, most conveniently and advantageously situated, and being almost the only land remaining undeveloped between these populous suburbs, with frontages to Fawe Park, Skelgil, Brandehow, and Putney Bridge Roads, the latter eminently adapted for shops, being immediately opposite the intended Public Park and Recreation Ground.

Particulars of Messrs. WATERHOUSE, WINTERBOTHAM, HARRISON, and HARPER, Solicitors, 1, New-court, Lincoln's Inn, W.C.; or of Messrs. TUCKETT and SON, Land Agents, Surveyors, &c., No. 2, Basinghall-street, E.C.

SUTTON, SURREY.—FREEHOLD

BUILDING LAND for SALE, in cheap lots. Practically no restrictions. Roads made, gas and hot-water laid on. Free conveyances. Any sized plots. Payment by instalments if required.—Brooks and HELLER, 8, Old Jewry, E.C.

TOOTING.—In the main road from Streatham to Mitcham.—Ripe Building Estate.—Close to Streatham and Tooting Junction Stations and the Recreation Ground.

WEATHERALL and GREEN will SELL by AUCTION, at the Mart, City, on MONDAY, JUNE 27th, at TWO, in one lot, 53 acres of valuable FREEHOLD BUILDING LAND, ripe for immediate profitable development, situate opposite Gorrings Park, and having a good frontage to Streatham-lane, possessing great capabilities for building. In addition, a valuable bed of gravel underlies most of the land. Let on lease determinable at Michaelmas, 1899, at £160 per annum.—Messrs. GROVER, HUMPHREYS and SON, Solicitors, Temple. Particulars of the AUCTIONEERS, 22, Chancery-lane.

TOOTING.—Secure Freehold Investments in modern, red-brick, detached residences, standing in their own grounds in one of the quietest suburbs of London, facing an open common, but within a stone's throw of the Tooting Junction Station on the L.B. and S.C. and L.S.W. Rys., and within convenient distance of the tramway terminus. By order of Executors.

WEATHERALL and GREEN will SELL by AUCTION, at the MART, City, on MONDAY, JUNE 27th, at TWO, in Lots, the following FREEHOLD detached RESIDENCES, of attractive elevation, in red brick, each having a large area of well-matured garden ground:—

The Chestnuts, lot at per annum ... £55
The Firs, lot at per annum ... £75
Heatherhurst, lot at per annum ... £80

Also a Freehold Ground-rent of £25 per annum, secured upon the adjoining residence, known as Inglemere. The valuable Freehold Building Land with considerable frontages to the main road, and containing about five acres, admirably adapted for speedy and profitable development.—Messrs. GROVER, HUMPHREYS, and SON, Solicitors, Temple. Particulars and plans of the AUCTIONEERS, No. 22, Chancery-lane.

SANITARY INSPECTORS' EXAMINA-

TIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I. B. A. EXAMS. PREPARATION,

personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

ARCHITECTURAL INSTITUTE and

CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, personally or in residence. Fourteen first places.—G. A. T. MILDEN, 19, Craven-street, Strand, W.C.

NOTTINGHAM.—Old-established SANI-

TARY PLUMBER'S BUSINESS, large jobbing and contracting connection, for DISPOSAL, owing to death of proprietor; main thoroughfare; recently fitted up workshops; splendid modern plant; unique opportunity for wholesale plumber; large contracts running.—Apply MELLORS, BASDEN, and MELLORS, Estate Agents, King John's Chambers, Nottingham.

PLANS and GENERAL ESTATE WORK

WANTED by Young Surveyor; experienced; terms low.—B. B., Horncastle's, Cheapside.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

WANTED, ARCHITECTURAL ASSIS-

TANT in Municipal Office of large Midland town. £2 10s. per week.—Apply, enclosing copy tests, Box 729, BUILDERS' JOURNAL Office.

RAPID and effective young DESIGNER

and Perspective DRAUGHTSMAN WANTED. Part time or permanency.—Write, HOUSEKEEPER, 113, Finsbury-pavement, E.C.

BOROUGH of SOUTHBEND-ON-SEA.

BUILDINGS INSPECTOR.

The Corporation invite APPLICATIONS for the APPOINTMENT of a BUILDINGS INSPECTOR, at a salary of £104 per annum.

The person appointed will be required to supervise the erection of new buildings, and to see that the bye-laws in force within the Borough with respect to new streets and buildings are complied with, and it is essential that he should be practically acquainted with building construction, and have a thorough knowledge of the model Bye-laws of the Local Government Board, under the Public Health Act, 1895.

Applications to be made in writing, accompanied by copies of not more than three recent testimonials (which will not be returned), stating age, qualifications, experience, and where at present engaged, to be delivered at my office before ELEVEN o'clock a.m. on THURSDAY, JUNE 23rd inst.

Canvassing members of the Town Council will be a disqualification.

By order,

WILLIAM H. TURNER,
Town Clerk.

Southend-on-Sea,

June 8th, 1898.

QUANTITY SURVEYOR'S ASSISTANT

WANTED, for temporary Engagement. Good abstractor and biller.—State experience, age, and salary required, to Box 743, BUILDERS' JOURNAL Office.

THE NORTH-EASTERN RAILWAY

COMPANY require a QUANTITY SURVEYOR to take charge of the Quantity Surveying Branch of the Architect's Department. Salary £400.—Applications to be addressed to the SECRETARY, North-Eastern Railway Company, York.—York, 13th June, 1898.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A.,

DESIRES to ASSIST others

in the
PREPARATION of DRAWINGS
at his own office.

G. SCOREE, 28, Newman-street, W.

TO LAND AGENTS and COUNTY SUR-

VEYORS.—Plans from rough sketches by first-rate draughtsmen. Farm Buildings and Workmen's Cottages a speciality. Most moderate terms.—Letters, ROYAL ENGINEER, care of Mr. West, Avonmore Villa, Knaphill.

ARCHITECT'S ASSISTANT desires

ENGAGEMENT in London. Seven years' experience; thoroughly practical, can take job from start to finish, survey and level.—"Ivanhoe," BUILDERS' JOURNAL.

SITUATION as CLERK of WORKS RE-

QUIRED; thirty years' practical experience; several architects' references as to character and capabilities.—Address, W. EDWARDS, The Lynches, Shalford, Guildford.

ARCHITECT'S ASSISTANT desires EN-

GAGEMENT. Ten years' experience. Working and detail drawings, specifications, perspectives, competitions. Excellent references.—S., 98, Blenheim-crescent, London, W.

ARCHITECT and SURVEYOR, desirous

of residing at a rising seaside resort, is willing to UNDERTAKE EMPLOYMENT. Reasonable terms. Long experience. Management of property, laying out land for building, road sanitation, specifications, quantities, villas, shops, flats.—H. FRENCH, 21, Moreton-street, S.W.

BOOK-KEEPER and CASHIER, used to

the Building Trade, thoroughly experienced, desires RE-ENGAGEMENT. Highest references; 7½ years. Would undertake management of branch business. Shorthand.—Write, A. G., 9, Gracechurch-street, E.C.

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

WITH SURVEYING AND SANITARY SUPPLEMENTS

IN MEMORIAM.

SIR E. BURNE-JONES.

ONE by one the stars in that little constellation of artists whose works since the early sixties have done so much for the Art of our day have sunk beneath our horizon, and their orbits sweep a wider sky. It seems but the other day that Morris died, and we followed sadly the garlanded wain which wound its way through Oxford lanes like a sunny memory of a happier time. It was not a funeral, but a parting feast made to the hero of many fights, the skald of many lays; we celebrated not his loss, but his coming to his kingdom. Now his friend — it seems impossible to write of either alone — the twin star of that brilliant group — has been swept from our sight, too suddenly for us, yet not without a strange appropriateness when we think of their closeness to each other. There is something very beautiful in the relation of the two artists. Morris, with his sturdy northern virility, was a tower of strength to the dreamer of strange and beautiful visions; the inequalities of each seemed to interlock, and the two made one. Either had done more than enough to win a lasting place in the temple of fame, but united they became a force which transformed the whole artistic aspect of their time. They erected a new ideal, created a new canon of criticism, formed a new style. And the paintings of Burne-Jones, the poems, the lectures, the designs of William Morris, turned again to a study of Nature the minds not only of artists, but of a very large section of the public. It is impossible to look at any exhibition of contemporary Art, either at home or abroad,

without realising the immense influence exercised by the ideals of Burne-Jones. Critics may cry as they will at what they call the lack of draughtsmanship, of the power to paint; the common Philistine may shrug his shoulders at what for his obtuseness is impenetrable mysticism; but those apart, most will agree that the lofty ideals, the deep sense of mystery, of beautiful colour, the fine feeling for line, for spacing, for mass, have never been approached by any other artist of the day. It is useless to dwell here on his personal history, or upon that of the movement with which he was associated, these have been long well known, and every paper is full of them. It were better to dwell on his influence. To come upon any of his works for the first time, wherever they may have been encountered, has been for most an unforgettable

public. While in so many other painters one's attention is perforce directed to the paint, to the canvas, to the ability of the artist; before Burne-Jones one is compelled to see with his eyes; he fascinates, mesmerises, and only when the conception has sunk into one and is accepted, only then is the attention turned to the manner in which the miracle has been achieved. We accepted his ideas not as things we knew, had seen or handled, but as things which must exist could we but see them for ourselves. One thinks of him as a modern Merlin, his wand turned paintbrush, casting the glamour of his personality near and far. For, as said before, it is not in England alone that we find painters working under his spell, but abroad, Puvis de Chavannes, Fernand Knopf, to name no lesser lights, show indisputable traces of his power. M. de

Chavannes, with whom I had the honour of discussing Burne-Jones, expressed for him the liveliest admiration, and, coupling his name with that of Watts, called the two England's greatest painters. The secret of this overmastering influence is, I think, to be found in the fact that Burne-Jones, having found himself very early in his career, never allowed anything to come between himself and the attempt to give expression to his personality. He sought by every means in his power quiet, retirement, contemplation, and, with great deliberateness, with indomitable courage, designed and drew and painted while the storm of unthinking controversy raged around his work. Critics exhausted their powers of mockery, unattached writers their derision, writers of comic operas made songs and poured out streams of alleged wit concerning the finest of his works. The London Charivari, as it ever does when anything noble crosses its path, led the host of comic papers to attack his paint-

Photo by Elliott and Fry.

THE LATE SIR EDWARD BURNE-JONES, BART.

moment. It was not the painting or the drawing that most drew us; it was the sense of completeness, the sense of remoteness, of invincible calm, inviolable peace, disengaged from his work. In the crowd of paintings near, his were like a clear window into another world, the vision struck home to one unhindered by any of those tricks of execution, those *tours-de-force*, which, in other painters, rouse the facile admiration of an unconsidering

ings and to rail at his ideals. But he kept to his work, changed nothing, only plunged the more deeply into his dream-world, and there, curtained round with visions, forgot about the fray. From the little sanctum which he created issued countless designs for glass, cartoons for mosaic, for tapestry, for embroidery. Innumerable studies of heads, of groups, of animals, flowers, Architecture. At stated intervals appeared in

succession "The Merciful Knight," "Chant d'Amour," "Laus Veneris," "Venus Mirror," "The Wine of Circe," "Love Among the Ruins," "The Wheel of Fortune," "King Cophetua," "The Days of Creation," "The Beguiling of Merlin," "The Golden Stair," "The Perseus" series, "The Nativity," "The Annunciation," and many single figure panels of great beauty. His work for Morris alone would have taken all the activity of many a lesser life. Yet in none of his work is there any trace of hurry; every line, every brush stroke looks in its place as the fibres on a flower stem or the colours on a petal. One thinks he made few mistakes, there was the immediate sense of what was to be done and the hand by long training did its work unhesitatingly. But for this delightful and complete subservience of hand to brain we could never have had the wonderful series of plant studies, the exquisite drawing of flowers, nor the simple direct draughtsmanship of his cartoons. Though the subjects are mysterious, something vague at times, there is nothing vague or tentative in the manner of their presentation. On the cartoons one sees the unhesitating nervous line thickening here, thinning there, flowing like a liquid sheath round the forms he desired to suggest. The crayon seemed to have had a life of its own, and ever to run before the master's touch. Every student should see these things, and himself observe that wonderful continence of effort, that directness of touch, that immediate contact with Nature, the source of all inspiration. All through his life he kept up his study of Nature; yet one feels he seldom worked direct from his model. What it lost in actuality his work has gained by assuming that far-off cloistered solemnity of aspect, because distilled through the medium of his own personality. Every unessential fact, every obsessional detail was filtered away, leaving behind only the pure beauty of the conception. He was a worshipper of beauty in itself and for itself, unfaltering in his fidelity. Yet, because this is so, we do feel at times that in his patient research of beauty, in his pursuit of it, he lost strength; while seeking grace he lost at times that ruggedness which should serve as a foil: and in some of his paintings the over-elaboration deadens for one the impression the painter desired to produce. It is as if the bow, overdrawn, had sent the shaft astray. But what is, perhaps, most remarkable of all in his achievement is that he turned the attention of a whole host of painters from the frowsy domesticity in which they and the public all delighted to a world of beauty; to an inexhaustible mine of subjects, undreamed of by the best of them: he showed us the splendours of legendary history. This has given the Art of the nineteenth century a new impulse. Imagine what we should be now but for the Burne-Jones, Rossetti, Morris, and their school. The masterpieces of Watts would have stood like peaks on the dull plain of photographic studies of domestic interiors, fat models, painted in studio light, bathing themselves in open-air surroundings. But under the influence of Burne-Jones's work spurred on at first by unwilling admiration, afterwards by wild enthusiasm, the younger artists began to imitate him, and soon all the bourgeois ideals of the Early Victorian period—"The Toilet," "The Ball," "The New Dress," "Forsaken," "The Stile," "Lovers' Meetings," "The Trysting Place," the worn-out platitudes of painting, the bathos, the sticky sentiment, gave way to a nobler Art, a more dignified ideal. This was alone an achievement great enough to have made him famous, yet he did more. By the effect of his wonderful designs for stained glass, by his altar paintings and decoration for churches, he has revolutionised even the clerical ideal, and roused in the minds of many an unextinguishable hatred of the

mechanical spiritless productions so-called "Ecclesiastical Art." It is impossible at present to decide what his place shall be, nor can we estimate the value of his work, nor measure the whole extent of his influence. We can only get an approximate idea by referring to the opinions of Continental critics, whose view is more detached, more independent, than that of any Englishman could be. For the Continent there are only very few painters in England, but of those Burne-Jones is always selected as the first. Among the French particularly his work is valued, and has found many imitators, for they realise perhaps more keenly than us the decorative aspect of his work, and as a decorator he stands without a rival. His influence was paramount also in another sphere. In the inception of societies for the bettering of arts and handiwork he lent invaluable aid, and always gave ready help to such as the Arts and Crafts Society and the Art Workers' Guild. He was also, as might well be expected, an ardent admirer of ancient Architecture, and used his whole influence in what seems the hopeless attempt to stem the tide of destruction which is, despite even his efforts, sweeping away the most valuable relics of ancient Art. As a member of the Society for the Protection of Ancient Buildings, the memory of Burne-Jones will be cherished as that of one whose unflinching sympathy and powerful influence were always ready in the time of need. No one who saw it will readily forget his generous indignation at the unpardonable destruction of the front of Peterborough Cathedral. We have lost a fine artist and gained an abiding influence; we lose a great man, and find a great memory; we have lost a great designer and gained a living school. Whether we regard him as artist or man, Burne-Jones was one of whom any writer might be proud, and yet more, one whom we think could only have risen and flourished in the British Isles.

H. W.

In his second and last lecture on "Modern Methods and their Achievements in Bacteriology," delivered at the Royal Institution, Dr. Edward Klein was mainly engaged in the discussion of the chemical activity of bacteria. He began by speaking of the flagella, which gave certain species the power of brisk movement, and showed how appropriate methods of staining these flagella had enabled some varieties that resembled each other very closely to be clearly distinguished. Reference was next made to the existence of spore-forming bacilli, and the practical importance of this fact was emphasised on account of the enormous resistance offered to inimical influences by some of such organisms. He proceeded to mention some of the practical results that had been obtained by the study of the action of pure cultures of various bacteria. It had been found that the cells of some bacilli included poisonous principles, a poison being formed in their protoplasm which had an action on animal bodies. Again, some bacilli contained in their substance a specific poison. Koch first pointed out that an extract of the pure culture of tubercle bacillus gave striking results when injected into an animal body already tuberculous, and thus afforded an important means of diagnosis. The lecturer next spoke of the toxic substances formed by disease-producing bacteria when grown in nutrient media, and described how these toxins could be used to give the animals, if they were suitably administered, immunity against the disease. In the blood of animals so treated an antitoxic principle was produced, which, in its turn, could be employed as a curative agent. The lecturer concluded with a consideration of the theories of the nature and mechanism of immunity, which was attributed to a germicidal principle, present in the blood of the immunised individual, and with a reference to the agglutination action of the specific blood serum and its practical application for diagnosis.

An Architectural Causerie.

Architecture at the R.A.: Further Suggestions. WE have to thank Gladstone, amongst others, for proving the Academy to be a public institution for the advancement of British Art.

In the strictest sense, therefore, are its members trustees; and, moreover, their responsibilities are greatly enhanced by the fact that only moral restriction need hamper them. We can hardly believe that were the Academy founded to-day the charter would be granted so unconditionally to any forty men. The system is emphatically un-English. However, it faithfully reflects the spirit of an age when the king was despotic and monopolies were in evidence. We have little doubt that the Academicians endeavour to the best of their ability to further the interests of British Art, and are considerate of public opinion. Hence these suggestions. No one with a knowledge of the Arts questions the pre-eminence of Architecture. But the statements of William Morris on this point at Birmingham, in February, 1894, may have weight. "The proper understanding of Architecture is at the present moment of such overwhelming importance in the consideration of the future of the Arts that I must say a few more words about it, even though it be in parenthesis. I mean, in plain terms, that the manner in which our buildings and especially our houses, are built is really the foundation of the whole question of Art; and that, if we cannot build fit and beautiful (not necessarily highly decorated) houses, we cannot have Art at all in our days. Reflect on it! a picture may be hidden in a drawing-room; a book may remain unopened on a library shelf; a drawing or engraving shut up in a portfolio; but a house is always in evidence to injure every passer-by by its badness; or benefit him by its goodness." Can we, therefore, believe that our trustees treat the pre-eminent Art entirely well in apportioning 7838 square feet to painting,* 1624 square feet to sculpture, and a *cul-de-sac* of 486 square feet to Architecture. Is it surprising that the B.P. cares so little for Architecture when their mentor in such matters treats her thus inadequately? Surely not. A restriction of three exhibits by outsiders would enable one more room to be given to the greatest Art, and might even do away with that unpleasant necessity, an opera glass. This is a time when signs are in evidence of a new style in embryo, and the R.A. should take warning from the R.I., etc., that the new growth must have ample space for its exercise. Wherefore we submit that architects should offer their desirable haven as an additional room for paintings, and in return ask for as many rooms to be opened in the winter, simultaneously with the "old masters," as the hangers consider will make a satisfactory exhibition. What an incentive to Art this would be! A room could be devoted to executed buildings with working drawings, photographs, &c., and another to *projets* with models; or a classification of rooms might be made, as ecclesiastical, municipal, domestic, decoration, designs, and so forth. Yet another suggestion. Let the R.A. have a representative in Parliament. From his very vocation it is obvious that the broad-mindedness necessary for a great architect renders him most suited for such an honour.

P. A. R.

* Approximate dimensions (plan only, not wall space), taken from E.A. catalogue, on the assumption that the architectural room is 27ft. long.

SPAIN:

Its Picturesque Cities and Monasteries.

III.—TARRAGONA.

By F. HAMILTON JACKSON.

THE city of Tarragona is the capital of the province of that name, and is the seat of an archbishopric, the holder of which is Primate "de las Españas," and therefore ecclesiastical rival of the Archbishop of Toledo. It is a remarkably healthy place, the air is mild but, from its great dryness, bracing, sometimes, indeed, becoming rather keen. There are no standing waters near, nor is irrigation employed. The walks are beautiful, looking down toward the sea, while in various directions on the land side are scattered pine woods, heaths, and aromatic wastes, where the wild lavender and sweet-smelling shrubs perfume the air even in mid-winter.

It stands upon a limestone rock, some 760ft. high, rising above the river Francoli and the sea, which has been occupied as a town ever since the Phœnicians made a settlement there. The name "Tarragona" appears to be a corruption of that which they gave it, "Tarchon," said to signify "a citadel." The brothers Publius and Cneius Scipio were the first Romans who occupied it. It was raised by Augustus to be the capital of the province, he having wintered here (B.C. 26) after his Cantabrian campaign, and here he issued the

decree which closed the temple of Janus. In the war between Cæsar and Pompey, Tarragona sided with the latter, but on the victory of the former submitted humbly to the lord of the world, sent ambassadors to him, and obtained his pardon and protection; and he resided here for some time before he went to Cadiz. Under Augustus it became the residence of the propretor, who had under his orders the three legates who governed Spain, being conveniently situated for communication with Rome. The city then extended on the west beyond the slopes on which it now stands, to the river Francoli, then the Tulcis, and on the south to the sea. On the east, and close to the Presidio (the prison) were the Thermæ, and temples occupied a great part of the space, among them being one to Augustus, erected during his lifetime. The amphitheatre rose not far from the shore (very few remains of it are left as it has been used for a quarry, and these are enclosed in the Presidio), and on the eastern slopes a large and noble stone ascent led from it to the upper city, where was situated the Palace of Augustus, of which there are small remains to be seen under the name of the Carcel de Pilato—Pontius Pilate being claimed as a townsman by the Tarragonese—and this building, the walls of which are 20ft. thick in some places, and probably Phœnician work in the lower stages, being assigned to him for a palace.

There is also a tower remaining from the same building, at the foot of the south walls of which began the spacious circus. The outline of it may still be traced in part of its course. It was 1212ft. long and 270ft. wide. Several houses have been built with its ruins against its very walls, and the area has become the present Plaza de la Fuente, the well from which it takes its name dating from Phœnician times. The capitol rose on the site now

occupied by the cathedral, and on the way from the Archiepiscopal Palace to the Puert^o Rosario there are still three towers which formed part of that edifice; two are embedded in the wall, the third standing isolated. The lower part of the walls, it may be observed, is Cyclopean, and dates from Phœnician times, the Scipios having made use of them as foundations for their own fortifications. Outside this gate is another relic of the same period, a gateway formed of huge stones, the sill of which is much below the present level of the ground.

In Roman times the population exceeded a million, but the various misfortunes which have befallen the town at the hands of conquerors have reduced the inhabitants to 30,000, which is, however, more than double the number of fifty years ago. The Goths made it their capital, but destroyed more than they built. They removed the archbishopric to Vich, but it was restored in 1089; to the disgust of Toledo, which disputes the primacy. The Moors, under Tarif, made of the city a heap, and the ruins remained uninhabited for four centuries.

"Tarkuna," as it was then called—the site of it, at least—was granted by Ramón Berenguer El Grande in 1116 to San Olaguer of Barcelona, who began a church there in 1128, being aided by Robert Burdet, a Norman chief, to whom he had delegated his authority. The wife of this Robert Burdet, Sibylla, during her husband's absence kept armed watch upon the walls, like a true chieftain's wife, and beat back the Moors, after which the place became a frontier fortress, and but little more, for Christian commerce centred at Barcelona, and Moorish traffic preferred Valencia. Tarragona was the scene of one of Suchet's butcheries in 1813. Women and children while trying to escape were shot down, and the streets ran with blood, while nameless horrors were perpetrated by the soldiery. Suchet boasted of his act, saying that he intended "to intimidate Spain by the destruction of an entire city."

It is said that both architect and workmen were brought from Normandy to build the cathedral, and the severe character of the Architecture may be held to justify the report, though there is some admixture of Moorish detail and feeling to be traced here and there, and the design of the window traceries is of later date. No names are given of those who commenced the work, but, after some time, that of Maestro Fray Bernardo is recorded as that of the architect, and probably a good deal of the internal architectural carving of the earlier period is due to him. The cathedral stands on a platform to which eighteen steep steps ascend from the Market Place "de las Coles." The façade consists of a deeply recessed central portal, with two side doorways, between which and the central door are two massive piers crowned with pinnacles. The bases of these piers are decorated with small Gothic arches, above which are niches for twenty-one statues of apostles and prophets, which stand under truncated Gothic canopies. They are most of them the work of Maestro Bartolomé, who carved them in or about 1278, but a few were made by Jaime Castayls in 1375. Two or three niches are empty, and local tradition says that every hundred years one figure steps down! There is a central pillar beneath the arch, bearing a Virgin and Child, and above it the lintel is sculptured with the Last Judgment, the tympanum being pierced with tracery filled with coloured glass. Above the door is a large pointed window, and above it again a very fine rose of 1131.

The gable was to have been finished with a high pointed arch and the piers with slender pinnacles, according to the plans preserved in the archives of the cathedral, but the works stopped before they reached that height, and the façade now ends in a curiously truncated way. Above the side doors are two reliefs of early date, representing respectively the dream of St. Joseph, and the adoration of the kings. The doors are completely sheathed with pieces of sheet iron, laid on something like cut slates on a roof, each showing a diamond shape, nailed round the edges with copper nails, and with a central boss of bronze to each. This was done in 1456 by Archbishop Gonzalez, at

Ancient Masonry
Tarragona

DRAWN BY F. HAMILTON JACKSON.

TARRAGONA CATHEDRAL: CAPITALS OF THE CLOISTER DOORWAY.

which time the four beautiful knockers were made and the pierced hinges, all of them mainly cut from the iron when cold, not forged when red hot. The bell tower is a massive lantern-like structure with truncated pinnacles and cornice, it groups well in the eastern views of the cathedral with the transept and apse.

The nave is very solemn and severe in style, the arches being without mouldings and very massive. It is lighted by large fourteenth century clerestory windows of three lights. The plan is cruciform, and there are ten piers on each side, the east end being much darker than the west. This is partly owing to the great rose windows in the transepts having been filled with full coloured glass in the sixteenth century, which sparkles jewel-like in the gloom. It is so dark that the sacristan obligingly lights a taper to point out to visitors the things which he considers most worthy of notice in the retablo of the altar mayor, such as a spider's web, or other insects hanging from delicately-carved leaves, exceedingly detailed drapery, and so forth.

It is a work of the fifteenth century, and contains scenes from the life of Christ, and of the martyrdom of St. Tecla, who is the tutelary of Tarragona. In the choir the archbishop's throne is fine, and so is the *reja*. The organ dates from the sixteenth century, but bears its age well. The font was a Roman sarcophagus, found in the ruins of the Palace of Augustus. The crossing is very fine viewed from the door of the Capilla del Sacramento. The colour of the stone is cold, and adds to the appearance of severity in the design. There are a few early tombs of archbishops around and behind the high altar, the earliest being that of Cyprian, date 683. The roof of the Capilla del Sacramento is a Roman vault, it was the refectory of the canons when they lived in community. In the Capilla de los Sastres, the chapel of the tailor's guild, is a very good small Flemish stained glass window and a painted retablo, which looks decorative, but cannot be examined, there being far too little light.

(To be continued.)

ANOTHER addition to the Yorkshire College at Leeds was made by the laying of a foundation stone of a new wing, to be devoted to the leather industries, of which Leeds is now an important centre.

THE corner-stone of the new English church at Lucerne, which is being erected by the Colonial and Continental Church Society, was laid a few days ago by Mr. Frederick Robert St. John, Minister Plenipotentiary at Berne.

A VERY COMPETITIVE COMPETITION.

NOTES ON THE TROWBRIDGE TECHNICAL SCHOOL DESIGNS.

BY A SPECIAL COMMISSIONER.

THE Trowbridge Technical School competition was decided on Wednesday, June 8th. The duty of selection, which devolved upon the assessor, Mr. E. W. Mountford, was rather severe, as there were no less than sixty-seven designs submitted by architects in practice in the Midlands, London, and Cardiff. The subject has therefore proved an unusually attractive one, and it appears curious that there should be so few schemes of merit amongst the number.

The site selected by the committee is a corner one, with unobstructed light from three sides, and solid foundations 6ft. below the surface. It was, therefore, peculiarly adapted for the purpose and comparatively easy to deal with; the amount to be expended, according to the conditions, was some £5500, and the requirements embraced, besides the usual Science and Art rooms, a weaving shed of not less than 1200ft. super, plumbing, metal, and carpenters' and joiners' shops; cookery school and laundry, three class-rooms, and a lecture theatre to accommodate eighty students, and no provision was required for caretaker.

Mr. Mountford was engaged in adjudicating upon the designs on Tuesday afternoon and Wednesday, and a meeting of the Technical Education Committee was held on Wednesday afternoon, when Mr. Mountford read the following report:

"17, Buckingham Street,
"Strand, London,
"June 8, 1898.

"To the Technical Education Committee
"of Trowbridge.

"Gentlemen,—In accordance with your instructions I have carefully examined the whole of the sixty-seven designs submitted for your proposed new building. Several of them are of very considerable merit, showing not only much artistic ability, but also an intimate acquaintance with the requirements of this class of building. The question of cost has of necessity entered very much into the consideration of the competing architects, and some have therefore proposed to face the building with red brick and terra-cotta rather than stone. But I would strongly urge you

to have a stone building, or at least a building chiefly of stone. There is little objection to the use of some red brick, but terra-cotta is altogether out of harmony with Trowbridge, the old buildings of the town being of admirable design and of strongly local character—a character which could by no means be reproduced in terra-cotta. You would do well to allow, if necessary, sufficient to cover the difference in cost between brick and stone facings.

"Taking everything into consideration, I selected six designs as being the best, having regard to your instructions. Others of much merit had to be passed over for various reasons. These six designs are numbered respectively 57, 63, 8, 18, 55, and 29. Further consideration decided me to place No. 57 first, and No. 63 second. Nos. 8 and 18 are of such equal merit that I would like to bracket them as equal for the third place.

"I have the honour to be, Gentlemen,

"Your obedient servant,

"ED. W. MOUNTFORD."

After further explanations by Mr. Mountford, the numbered envelopes containing the names of the architects were opened by the chairman, Mr. W. Walker, and it was found that No. 57, placed first, was by Mr. T. Davison, 59, Great Ormond Street, London; No. 63, placed second, by Messrs. Briggs and Wolstenholme, Blackburn; and Nos. 8 and 18, equal third, by Mr. Dunbar Smith, 28, Theobald's Road, Gray's Inn, London, and Messrs. Hall and Bishop, Leighton Buzzard.

The architect of the selected design places the weaving shed in the internal angle of site, with top north light over, the physics room occupying the space between the side of same and Castle Street on the basement floor, the wood carving and other trades on the Museum Street front, lighted from an area extending to the boundary of site. On the ground floor are placed the cooking school, scullery, and larder, separated from the laundry by the entrance and staircase, which is on the Castle Street front. The only lavatories for males and females besides the accommodation for them in the basement is placed at head of staircase partly over the end of weaving shed. The lecture and preparation rooms are on the ground floor, lighted from Museum Street, with additional light from Narrow Wine Street, at the back of the students' seats and in the eyes of the lecturer, which we do not consider very well advised. On the first floor are the three class-rooms, with left-hand light, and the chemical laboratory and balance-room, with a balcony for opening noxious gases. The principal's room is at the head of stair-

case on this floor. The art rooms are all placed together in the attics, and the chemical laboratory is carried up two floors in order to keep the same ridge level throughout the two main street frontages. It is here that Mr. Davison has scored over his fellow competitors, for, by hiding the whole of his art rooms behind the roof slope of the building, he has in reality converted a four-story building into a three, from the perspective point of view. The rooms are well lighted from the N. and N.E.; but we are inclined to think that their utility would be much enhanced and the floor accommodation increased by giving the rooms vertical walls on all sides. The workshop accommodation appears very limited for the requirements. Mr. Davison cubes his building up at 228,728ft., and prices it at 6d., which works out at £5718. The heating and ventilating arrangements are well considered, and will be, by means of ventilating radiators, worked on the low-pressure hot water system, and the ventilation on the exhaust system. The elevation is treated in a quiet and unostentatious Georgian manner, with stone basement and quoins, and stone dressings to the windows, filled in between with brickwork; a simple stone cornice carries the eaves of the tipped and tiled roof.

No. 63, the second premiated design, shows the weaving shed at the back of site, with top light over one half, and the class-rooms are distributed on the basement, ground, and first floors, which, with the physics laboratory on the ground floor, are weak points in the scheme. The cookery school and laundry are on the first floor, and the art rooms on the second floor; the latter are not at all well lighted. The elevations show a much more ornate treatment than the first premiated design, though not nearly so satisfactory from an æsthetic point of view, though we must conclude, judging from the many objects in the plan, that the authors owe their position more to their elevations than anything else.

No. 29, one of the third premiated designs, is chiefly remarkable for the extraordinary curly character of the printing, and still more eccentric elevation. The weaving room has no top light, and the physics laboratory is placed on the ground floor. The art rooms on the second floor appear to have been well considered. The author enters his building from the Castle Street side, beneath an overhanging bay supported on brackets. A good perspective drawing shows the treatment of the exterior to great advantage, but we must take exception to the bay window on the Museum Street frontage.

The authors of the other third premiated design arrange their building round a central triangular area, which we consider would be of very little practical advantage for lighting purposes. They likewise give no top light to their weaving shed, and their class-rooms are divided between the three lower floors, with the physics laboratory on the first floor, three weak points in the design; they also divide the art rooms between the first and second floors, which is not desirable. The elevations are Renaissance in character, with stone facing.

The highly commended designs (it sounds rather like a poultry show) are by Messrs. Tyars and Jago and Mr. F. E. Thickpenny; the former send in a rather unfinished set of drawings, with no top light to weaving shed, and physics laboratory on first floor, where they also put their lecture theatre and chemical laboratory, a disposition which has been followed by other competitors.

No. 60 shows a pleasing elevation, but bad plan, and is cubed out at 6d. and 4d. No 34 is by Messrs. Houston and Houston, who have a very fair plan, and place their lecture theatre on the first floor with the chemical and physics laboratory; the class-rooms are not all on the same floor.

No. 50 sends a very good plan with the exception of the physics laboratory on the first floor; top north light to weaving shed and the other rooms well placed and arranged. This scheme appears worthy of a better place in the competition than has been awarded to it.

No. 58, by Mr. Alfred Cox, is also another good

scheme, but having no top light to weaving shed. The lecture theatre, chemical laboratory, balance-room, and class-rooms are all placed on the first floor; the art rooms are well placed and well lighted; a good perspective view is submitted which shows an architectural treatment of Georgian character of brick and stone. We must, however, take exception to the brick arched treatment below the eaves cornice.

No. 54, by Mr. Wellar, is remarkable as being the only design we noticed with the entrance at the angle. The author has in consequence placed his rooms at an angle with the frontage line, which has involved untold difficulties in the plan.

No. 53 is arranged with a central area opening out to Narrow Wine Street; the rooms are ranged round same, by which means the author has been able to condense the building down to three floors. There are many defects in the plan, and the lighting is not all that could be desired.

Nos. 61 and 15 are by Mr. J. H. Phillips. Both plans are poor. The former shows a curious circular arrangement in the elementary art room, apparently for the purposes of model drawing. This building is entered from Castle Street, and has a central area.

No. 40, by Messrs. Battery and Birds, shows the class-rooms on the ground floor, and has arranged the cookery school with scullery and larder between same and laundry; the building is entered from Museum Street.

No. 30 sends in an extraordinary elevation of ponderous character, and a very bad plan.

No. 33, by Messrs. Silcock and Reay, exhibits a good perspective in strong line and wash. The weaving shed has, however, no top light. The lecture theatre is arranged with circular seats.

No. 62 shows a very ill-considered plan and poor elevations.

No. 37 puts the principal's room near entrance and enter the building from Museum Street. No perspective view is exhibited.

No. 7 is one of the most curious and remarkable schemes in the room. The plans show a wonderful kind of corkscrew staircase in the centre of the building, arranged on the lines of Louis XV. curves; the rooms are badly placed and lighted; the elevations suggest the music hall rather than the technical institute, and are very scrolly and curly, also very unfinished, which is perhaps as well.

No. 25, by Messrs. Wimperis and East, exhibits a poor plan, but, on the other hand, a good style and character of elevation.

No. 1, by Mr. Martin Brooks, shows a fair plan, but poor elevation.

No. 67, by Messrs. Goldsmith and Potter, has a satisfactory elevation; but weaving shed has no top light, and there are other defects in the arrangements.

No. 49, by Mr. Stanley, shows the entrance from Market Street between two semi-octagonal projections carried up to first floor. The elevations are quiet and dignified. The weaving shed has a partly glass roof.

No. 51, by Mr. Lewis, has a poor plan. The lecture-room and preparation-rooms are placed

TARRAGONA CATHEDRAL: FROM THE SOUTH-EAST.

TARRAGONA CATHEDRAL: CLOISTER WALK.

on the ground floor. The perspective drawing does not do justice to the elevations.

No. 46, by Mr. Wills, gives top light to weaving shed, and puts the physics room in basement, with a central staircase. The plan is satisfactory and the elevations are shown to advantage by a perspective view in the style of Raffles Davison.

Doubtless the features which guided the assessor in the selection of the first design were that the weaving shed was entirely top lighted, the class-rooms well arranged together, with left hand light in each case, the physics laboratory on the solid ground, as it ought to be, and the Art rooms lighted from the north and north-east, this also being arranged for the painting room. We consider, however, there were many better schemes in the room than either the second or third premiated designs, for as pointed out above, they present defects in their arrangements from which other designs were entirely or partially free; neither do we consider it a just principle to divide the third premium between two competitors.

In conclusion we must congratulate the Trowbridge Technical Education Committee on the exceedingly able manner in which the designs have been exhibited to view in the Town Hall, and the straightforward way in which the competition has been conducted throughout.

The old Renaissance buildings in the town are of very good character, and we trust the selected architect will introduce the feeling displayed in the details of that work, and thus continue the local characteristics.

The foundation stones have been laid of a police station and court house at Halifax.

The building trade in New Zealand seems to be in a bad way, for during April eleven builders and contractors in Wellington filed their schedules or compounded with their creditors.

The Parliamentary Committee of Newport Borough Council recommend the purchase for £5350 of a site belonging to the Ecclesiastical Commissioners, near Caerleon, and containing fifty-three acres, for the new borough lunatic asylum.

SPEAKING of Troyes Cathedral, in his article on "A Summer Sunday in Troyes," which appeared in our last issue, Mr. Thos. Francis Bumpus was made to remark, through a typographical error, that the edifice was "one of the few French churches planned with aisles to both nave and choir." This should read: "One of the few French churches planned with double aisles to both nave and choir."

ARCHÆOLOGISTS IN ESSEX.

THE Essex Archaeological Society held its first summer outing on Saturday week. The first jaunt was from Chelmsford to Roxwell. A visit was paid to the church, restored in 1854, which has very little of interest from an archaeological point of view. Not far from the church is Roxwell "Dukes," where a curious old portrait, let into the oak panelling above the fireplace, was seen in one of the rooms. The "Dukes" is a very old farmhouse, with a picturesque situation. From here a move was made for Skreens. The mansion, a large, square red brick building, having no pretensions to architectural beauty, takes its name from a wealthy family named Skreens, who possessed it early in the fifteenth century. The house has some very fine apartments, the hall being unusually large and lofty, and richly decorated. After a brief stay here, and an inspection of some of the rooms and the garden, the party moved to Willingale. There are two parishes of that name—Willingale Doe and Willingale Spain, and they are said to derive their distinctive names from their owners soon after the con-

quest, William d'Ou and Hervey de Spain respectively. The curious thing about the two villages is that their churches stand

IN THE SAME CHURCHYARD,

about 50yds. apart, this being the only instance of the kind in Essex. How they came to be erected so it seems impossible to determine. Tradition has it that they were founded by two rival sisters, but as the churches are of different ages, that story can hardly be true. Willingale Doe church was first inspected, and a short sketch of its history was given by Mr. W. C. Waller. The church, it was explained, was probably built in the fourteenth century, but it has undergone many alterations. On the south side of the chancel is a huge marble monument to Sir Robert Wiseman (1641), of Torrell's Hall, and on the tomb is an ancient helmet, which, from its size and weight, must have produced many a headache for its wearer. There are several brasses in the church, perpetuating the memory of some of the members of the old families of the neighbourhood, and these were described by Mr. Miller Christy. The church of Willingale Spain, which dates from the early Norman period, was also inspected, and a paper on

ITS ORIGIN AND HISTORY

was read by the rector. This building has also undergone alterations, and in 1748 it was made "as much like a whitewashed barn as the wit of man could devise." From the Willingales to Fyfield, the next stopping-place, the drive was through some very pretty and well-wooded country. At Fyfield the members were welcomed by the rector, who read a paper on the church, a large, ancient, and interesting structure, dedicated to St. Nicholas. There are several Fyfields in England, and curiously enough, nearly all their churches are dedicated to St. Nicholas. From Fyfield the party drove on to Chipping Ongar, where, under the direction of Mr. I. C. Gould, some extensive earthworks were examined and described. These are now thickly overgrown with large trees and underwood, and form a very pleasant and secluded retreat. Mr. Gould began his remarks by a reference to Henry de Lucy, one of the Norman barons, who held high offices in the time of Henry I., and built

A STRONG CASTLE AT ONGAR

on the site of these earthworks. But before his time, said Mr. Gould, there was no doubt a castle there, erected when the Danes and Saxons were struggling for supremacy, and probably even before that period the works were used as a Roman encampment, so that they would date back 1800 years. In the Norman times the castle was no doubt a huge,

TARRAGONA CATHEDRAL: THE CLOISTERS.

massive, and imposing building. In Elizabeth's reign it was pulled down, and the present farmhouse near the site probably built from some of the material. Dr. Laver, however, said he should go back further than the Roman period for the construction of these earthworks; he had an idea that such triple-moated fortifications were of British origin. He was of the same opinion with regard to those at Pleshey and Rayleigh.

A NEW IRISH CHURCH.

THE foundation stones have been laid of a new Presbyterian Church at Malone. The building consists of a nave and aisles with large projecting transepts. Prominence is given to the main doorway, which has octagon shafts, with moulded bases and caps, carrying a Tudor arch richly moulded and carved. Angular buttresses are placed at each side of the jambs, surmounted by moulded battlements. The main gable contains two large tracery windows, embraced by a relieving arch, with sable moulding,

A STORY FROM SOMERSET.

VANDALS IN THE AGGRESSIVE.

IT is a sorry story that comes to us from Somerset. The river Barle is spanned just below Dulverton by a bridge, which is noble in its old age. Its old stone guard walls are wrinkled and somewhat decrepit, so the Somersetshire County Council, with infinite facility, is going to mend the matter by putting up new walls of blue Staffordshire bricks! A correspondent—Mr. R. Staddon, Dulverton—sends us a timely protest:—"Barle Bridge," Dulverton, is an old stone bridge spanning the river Barle at the entrance to the town of Dulverton. The guard walls of the bridge, having been neglected, stand in need of repair. The Somerset County Council have discussed the matter, and have adopted a plan (presumably prepared by their surveyor), by which the old stone guard walls are to be taken down and new ones put up in blue Staffordshire brick. It is impossible to imagine a greater monstrosity, and it is incredible that an

AN EASTER SKETCHING RAMBLE.

By G. A. T. MIDDLETON, A.R.I.B.A.

(Continued from page 333.)

II.—AT HANOVER.

FOR all practical purposes there are two Hanovers; one, a fine, modern town, with wide streets, large shops, and great public buildings; and the other a mediæval city of narrow lanes, rendered all the more dark and narrow by the overhanging, upper stories of the wooden buildings. The old town is, however, enclosed within the new, and is being rapidly absorbed by it. Undoubtedly much of the old has already disappeared, and signs of continued demolition are in evidence, so that, in the course of another decade or so, one

"A STORY FROM SOMERSET." BARLE BRIDGE, DULVERTON.

having carved bosses and apex. Above the latter rises an angular finial. A massive buttressed tower, with a deeply recessed doorway, is placed at the south-west angle of the church. It is pierced by tracery belfry windows, and is crowned by a well-proportioned stone spire, which terminates in a gilt copper weather vane at a height of 125ft. At the opposite angle is an octagonal projecting staircase, with angle buttresses and a doorway between them. At the transepts are placed large traceried windows. All the gables are coped with moulded stones, and the roofs will be covered with green Westmoreland slates. The walling is of selected Scabro sandstone, with mullions of Giffnock stone. A portion of the front is divided by a flying buttress with novel effect. All the internal joinery will be of selected pitch and yellow pine, with Carolina sheeting for the roof and wall dados. The series of Tudor arches dividing nave from aisles will be richly moulded. Heating will be combined with ventilation. The contractors for the work, which is being rapidly proceeded with, are Messrs. Courtney and Co., and the architects are Messrs. Young and Mackenzie, Belfast.

A.R.I.B.A. should have conceived a scheme in such execrably bad taste. Should this precious plan be carried out, there will be a bridge, the piers and arches of which are of stone clothed in all those wondrous greys which are the work of the storm and sunshine of many a winter and summer, and the guard walls of one of the most ugly of building materials in use at the present time—a monument to that kind of economy (?) which, for the sake of a little (if any) extra cost, would utterly ruin the appearance of a bridge that is the admiration of artists and all having any eyes for the picturesque. We have had the appearance of one quaint old bridge at Dulverton irretrievably ruined already under the auspices of the same Council by the introduction of blue Staffordshire bricks. The people of Dulverton are not going to submit to have Barle Bridge treated in a similar manner. Probably it is not possible to treat the bridge in such manner as to make it a positive addition to the beauty of the landscape, but it certainly is possible to treat it in such a manner that it shall quietly harmonise with its surroundings, and not be the hideously obtrusive object it would be if the plan as proposed at present is carried out."

might probably look in vain for any domestic work of earlier date than the nineteenth century; undoubtedly to the benefit of the inhabitants from a sanitary point of view, and also from that of the fireman, but an irreparable loss of the picturesque. Fortunately, the modern work, as a rule, displays architectural taste, and the building is everywhere sound, mostly of bricks, and with both material and workmanship substantial. The more important buildings, too, are upon a really magnificent scale, particularly the palace and the theatre—the latter, a noble, classic edifice, open on all sides, of the type of which we have heard so much and seen so little in England of late.

Of the old buildings, the Market Church claims the greatest amount of attention, with much gold and rich colour introduced in the chancel with excellent taste. In most Continental countries, especially where the Roman ritual is in use, this sort of thing is gaudy and vulgar in the extreme, possibly captivating to some, on account of the glitter, but hurtful to most people. In Holland, where the Lutherans and Romanists are in approximately equal numbers, as also in some parts

of Germany where the same conditions obtain, the Lutheran churches are stripped of all decoration, and are frequently whitewashed; but round about Hanover, where all are Lutherans, the decoration is just as magnificent as in the Romanist churches of Brussels or Paris, but in infinitely better taste.

The church is not exceptional externally, save for two features, but these are rare and of considerable interest. The western doorway, in itself a German poverty-stricken example of the "Flamboyant," is made to carry an external balcony or pulpit, and the combination, strange as it may sound, is decidedly happy, looking well even with wire-drawn tracery, and full of possibilities under skilful treatment.

The other feature, though curious in effect and by no means lacking in a certain beauty, is by no means so adaptable, it being the occurrence of memorial mural tablets, many of them of rich design, upon the outside walls, where they naturally have not been very well preserved. They are mostly of the seventeenth century date, and of sandstone, inserted in the brick walls of the church, the bricks of which, by the way, are of the unusual dimensions of 10 in. x 5 in. x 3 in., and so very different from the small bricks of the low countries, and giving a more solid appearance than our own.

Of seventeenth century Renaissance there is also a fine example in the Leibnitz Haus, built in 1652, and now a museum. In its general idea and richness of detail, it is distinctly reminiscent of the François work of France, such as the Hotel de Valois at Caen, or the Hotel Bourgheroulde at Rouen, erected a century earlier than this, but the delicacy of the French detail is entirely lacking, and its wonderful elegance of proportion has been missed. It is, in fact, the sort of thing from which a suggestion may be taken, but which is not to be studied closely. The ironwork in grilles and window-guards is, in this respect, better. Rod iron is used and worked in scrolls, the terminals being hammered flat into masks and leaves, and simply stamped on face.

Close to the Leibnitz Haus is one of the stepped gables, with scrolls filling the steps, which one generally consider as characteristically German; but it is of timber and not of stone, and the question at once arises whether the form originated in stone or wood construction. Certainly it suits timber well and looks more natural in that material than in the more solid stone, timber lending itself better to the scroll work carving, and the surface enrichment which is largely used.

(To be continued)

At Hendon the foundation stone of a new infirmary was laid a few days ago. The total cost of the buildings and site will be nearly £108,000.

AFTER the frivolity—to use a mild term—of the Lantree exhibition, lately at 5, Regent Street, it strikes quite a new chord to meet there pictures so grave as those of the modern Dutch school, or the not long ago French Romanticists. Together with these tender water-colours of dignified field labours and landscapes by Anton Mauve, sad yet sadly true pieces of genre by Josef Israels, dreamy visions that seem almost to have the charm of evanescence by Corot, forest depths by Diaz, a Daubigny of his favourite "Banks of the Oise," with little cloudlets full of illumination in the high sky and shelving ground whose formation is beautifully delineated, there are what might seem incongruous works. Yet, as a matter of fact, no such result ensues, for the living British painters who are included have a good deal of likemindedness with the distinguished foreigners they share the walls with. There is a strong little Peppercorn, "The River," and a masterly little picture of a lordly recumbent tiger, "The Edge of the Jungle," by Mr. J. M. Swan, and a few more things of worth. Nor must such various examples of J. Maris as "Gathering Seaweed," "The Bridge," and "Old Amsterdam" be overlooked.

College Buildings at Reading.

THE NEW ADDITIONS.

THE Prince of Wales opened the new additions to the University Extension College, Reading, on Saturday week. Formed in 1892, at the instance of the House of Christ Church, Oxford, the college was incorporated in 1896, when the British Dairy Institute, formerly at Aylesbury, was added to it, with a block of handsome new buildings as the temple of orthodoxy in butter and cheese making. When the college, as distinguished from the institute, was founded, it had two buildings. One was an ancient and massive structure in flint, stone, and brick, hidden behind the new Town Hall. Originally, the dormitory of St. John's Hospital, attached to Reading Abbey, the ruins of which are still one of the

GLORIES OF THE TOWN,

had been used as a school of natural science, and it remains, the noblest feature in some respects of the new college. Reading educationists of to-day think, and most people will agree with them, that it was a happy fortune which linked the college with one of the most splendid traditions of the town. The old and the new buildings, including among the latter the block occupied by the Dairy Institute, form a picturesque group, especially as seen through the trees of Forbury Gardens. The one opened on Saturday week is of late Tudor Architecture, treated after the manner of collegiate edifices of the sixteenth century. The walls are of red brick, the windows of stone with moulded mullions and transoms. The architect is Mr. S. S. Stallwood, of whom it is written authoritatively that to his judgment and power of adaptation the college has often been indebted. More than £20,000 has been the cost of the properties and buildings now held by the learned corporation. No fewer than seventy rooms may be counted in the several buildings. There are three particularly noteworthy. The one called the Central Hall proclaims its antiquity by its

PONDEROUS WALLS AND CURIOUS RECESSES,

viewing which a learned visitor declared that his imagination was carried back to the "Reding" of old which Leland beheld as he paused on the Sonning uplands, a beautiful picture of running streams and fruitful pastures, and clustering towers, the home of saints and scholars. Another fine chamber is the College Hall, 44ft. long, 36ft. wide, 19ft. high. Its walls are half-panelled in pine, and it has five large mullioned windows, one of which is of stained glass, the work and gift of the Art students. This labour of love and talent displays the arms of Christ Church, of Reading, Oxford University, and the College itself. Above the chamber just described is one of equal size, the antique room, with green panelling and other wood work. The beauty of this apartment is the opened timbered roof.

MR. C. W. WILCOCKS has held an inquiry at Coventry into the proposal of the Corporation to borrow £33,000 for the purposes of electric light extension.

THE Duke of Devonshire visits Manchester to-day (the 22nd inst.) to open the new Christie Library at Owens College, and to lay the foundation-stone of the Whitworth Hall, another important addition to the college buildings.

A LOCAL Government Inquiry has been held into an application by the Warrington Corporation for sanction to borrow £31,933 for purposes of street improvement, £10,000 for the purchase of slot and other meters, and £700 for the purchase of a recreation ground.

THE principal thoroughfare of Blackpool (Church Street) has recently undergone considerable improvement, and a new square has been made at the junction with Abingdon Street. Hitherto the great obstacle to completing the work has been an ugly wall projecting right across the footpath, which the Winter Gardens Company refused to pull down.

KEYSTONES.

THE Duke of Connaught will to-day (22nd inst.) unveil the Albert Memorial window in the Collegiate Church of St. Saviour, Southwark, which has recently been restored.

At Bournemouth the Marquis of Northampton has opened the Victoria Home for Crippled Children, which has been erected in Alum Chine, near the sea, in connection with the Ragged School Union.

THE new Laboratories of Physiology and Pathology in connection with University College, Liverpool, which have been erected and equipped in the most adequate way for study and research at a cost of over £20,000, will be formally opened on the 8th October.

An exhibition of specimens of practical work by the candidates at the Technological Examination of the City and Guilds of London Technical Institute has been opened at the Imperial Institute. The majority of the exhibits are the exercises of student-apprentices during the examination, but some more complete specimens of handicraft are included. No candidate is allowed to exhibit specimens who has not also presented himself for the written examination in the principles of his craft. The exhibits include specimens of bookbinding, carpentry, metal work, plumbers' work, weaving, and other crafts. During the past session 32,155 students have received instruction in the technological classes registered by the institute, besides over 2000 students enrolled in the manual training classes. The total number who entered for examination was 13,060, exclusive of those in India and the colonies.

LORD HERSHELL, in opening the exhibition, remarked that they heard nowadays a great deal of the stress of foreign competition, and, although he was not one of those who regarded the future with gloomy and despairing eyes, still it was idle to ignore the fact that competition was constantly increasing, and they must face the fact that greater efforts must be made in the future than in the past if England was to hold her own. There was a time when all thoroughly solid and finished work was turned out in English workshops, but this was not the case to-day. The great facilities for communication had turned the world into one vast market. To master foreign competition we must send into the world goods in relation to price as good or better than other nations, and for this purpose improvement in the training of the worker, which should give him both speed and accuracy, was necessary.

MESSRS. J. AND L. HARRIS, of 28, Berry Street, Liverpool, have now on view at their galleries four excellent cabinet pictures attributed to Nicholas Limaeker, one of the "little masters" of Flanders, who flourished in the 16th century. Limaeker was dominated by the genius of Rubens, to whose Art his work bears a strong resemblance, saving that it adds to Rubens' exuberance of colour a minuteness of handling seldom seen in the work of the more grandiose Peter Paul. Limaeker was born in 1575 at Ghent, and became a pupil of Mark Guerard. After leaving his master's studio he went to the Court of the Prince of Paderborn, where many of his larger pictures were painted. In his youth he earned the soubriquet of "The Rose," a nickname which he justified later by the efflorescence of his colour. There are now in the Church of St. Nicholas at Ghent two pictures by him, regarded as his best efforts. The finer is "The Fall of the Rebel Angels," the title of the other being "The Merciful Samaritan." He died at Ghent in 1647. The four examples of his Art now in the possession of Messrs. Harris comprise the following subjects, drawn from the treasury of classic allegory:—"Venus and Adonis," "Jupiter and Juno," "Neptune and Amphitrite," and "The Birth of Aphrodite." They are all remarkable for precious colour, minute detail, and an almost pure classicism in the drawings of the figures. After the fashion which led the old Dutch masters to make their cabinet work practically imperishable, they have all been painted, not on canvas, but on large copper plates.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
June 22nd, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

MR. RICHARD GARNETT, C.B., LL.D., of the Printed Books Department of the British Museum, has joined the Society for the Protection of Ancient Buildings.

THE Journal of the Royal Institute of British Architects publishes in its current number a letter from the late Mr. Gladstone, just discovered among the Council documents:

"Hawarden Castle, Chester: 28 Oct., 1874.

"Sir,—I am very sensible of the compliment conveyed to me by the request which is contained in your letter of the 22nd.

"Nevertheless, it is my fear that I shall not be able to comply. My time is more than filled with engagements that I cannot set aside, and I could not readily turn to the thorough consideration of any matter such as would be suitable to be laid before the Society of British Architects. If within a reasonable period such a topic as would be manageable should occur to me, I will not scruple again to address you.—I have the honour to be, Sir, your faithful servant,

"W. E. GLADSTONE.

"C. L. Eastlake, Esq."

This letter was in response to a letter from the Council inviting Mr. Gladstone to read a paper before the Institute. The paper was never read, but at a meeting on the 30th April, 1877, when Dr. Schliemann delivered his lecture on "The Architecture of Troy," Mr. Gladstone, who was present, opened the discussion in a scholarly speech, and finally moved the vote of thanks.

MR. F. C. GOULD, who is now holding an exhibition of his caricature drawings at the Continental Gallery, has written a more than usually interesting preamble to his catalogue: "It is said that the earlier stages of a child's existence epitomise all the ages of evolution, and this is to a large extent true of the art of drawing. At first the instinct is to scratch with any available material on wall surfaces or tempting pages; then comes the period when the circle and the triangle do duty for head and body. After that the side-face and characterisation, and gradually the faculty of form and proportion is developed. When once man had found that humour can find expression in lines he never forgot it. The Egyptians caricatured on papyrus and stone, the Greeks and Romans on vases and in sgraffitos. In the middle ages Gothic ornament, with its conventionalised realism, afforded full scope for the grotesque and the satirical, which were daringly and cynically introduced on capital, corbel, or gargoyle, and notably under the miserere seats in the choir stalls. The

Renaissance, too, was rich in grim satire and Rabelaisian fancy. As for modern times, there is no need to enlarge upon the place which caricature fills to-day, both for amusement and political propaganda. Broadly speaking, the changes in method which have taken place are due, not so much to the fancies of caricaturists as to necessary adaptation to the popular mood of the day. In one generation the bludgeon is most effective, in another the rapier. At one time, when things moved more slowly than they do now, political caricatures were crowded, and depended largely on diffuse text. Nowadays everyone is busy, and cartoons must be concrete, and convey their meaning to the eye at first sight." Who will deny that Mr. Gould's succeed in touching the spot instantaneously?

THE annual general meeting of the supporters of the Royal Architectural Museum and Westminster School of Art was held at the museum, Tufton-street, Westminster, a day or two ago, the Duke of Westminster, president of the institution, being in the chair. The report stated that the past year had been a notable one in the history of the institution. It had been found possible to make, at a considerable outlay, a useful and substantial addition to the accommodation required for the Westminster School of Art, and incidentally to free the central hall of the museum from studies which were to some extent out of harmony with their surroundings. Four commodious class rooms had been added to the accommodation devoted to the school. The expenditure on the new building was about £2850, of which up to the present date about £2600 had been paid. The surplus of income over the ordinary expenditure for the year was £472.—The report was adopted on the motion of Mr. Aston Webb, seconded by Mr. J. P. Seddon.—On the motion of Sir Arthur Blomfield, seconded by Mr. J. H. Pollen, the Duke of Westminster was re-elected president, and the several vice-presidents were also re-elected.—The Duke of Westminster, in thanking the meeting for his re-election, said he considered it an honour to do anything in his power to second the efforts of the committee in keeping up the reputation of the museum and school of art as a whole. He had little doubt that the recent addition to the accommodation of the school and the consequent opportunities for the development of its work would increase its popularity and fame as one of the most successful centres of art teaching to be found in the United Kingdom. He congratulated them on the result of last year's examinations, when, in the most advanced subject (drawing from life), sixty-one candidates were presented from the school, of whom twenty-two obtained second-class certificates, twenty-nine first-class certificates, and eight "excellent," there being only two failures.
